<b>75 Video Output Switcher Control</b>	<b>2381</b>
<b>76 WiMAX subsystem</b>	<b>2383</b>
<b>77 The SGI XFS Filesystem</b>	<b>2391</b>

The following is a collection of user-oriented documents that have been added to the kernel over time. There is, as yet, little overall order or organization here — this material was not written to be a single, coherent document! With luck things will improve quickly over time.

This initial section contains overall information, including the README file describing the kernel as a whole, documentation on kernel parameters, etc.

## **LINUX KERNEL RELEASE 5.X <HTTP://KERNEL.ORG/>**

These are the release notes for Linux version 5. Read them carefully, as they tell you what this is all about, explain how to install the kernel, and what to do if something goes wrong.

### **1.1 What is Linux?**

Linux is a clone of the operating system Unix, written from scratch by Linus Torvalds with assistance from a loosely-knit team of hackers across the Net. It aims towards POSIX and Single UNIX Specification compliance.

It has all the features you would expect in a modern fully-fledged Unix, including true multitasking, virtual memory, shared libraries, demand loading, shared copy-on-write executables, proper memory management, and multistack networking including IPv4 and IPv6.

It is distributed under the GNU General Public License v2 - see the accompanying COPYING file for more details.

### **1.2 On what hardware does it run?**

Although originally developed first for 32-bit x86-based PCs (386 or higher), today Linux also runs on (at least) the Compaq Alpha AXP, Sun SPARC and UltraSPARC, Motorola 68000, PowerPC, PowerPC64, ARM, Hitachi SuperH, Cell, IBM S/390, MIPS, HP PA-RISC, Intel IA-64, DEC VAX, AMD x86-64 Xtensa, and ARC architectures.

Linux is easily portable to most general-purpose 32- or 64-bit architectures as long as they have a paged memory management unit (PMMU) and a port of the GNU C compiler (gcc) (part of The GNU Compiler Collection, GCC). Linux has also been ported to a number of architectures without a PMMU, although functionality is then obviously somewhat limited. Linux has also been ported to itself. You can now run the kernel as a userspace application - this is called UserMode Linux (UML).

## 1.3 Documentation

- There is a lot of documentation available both in electronic form on the Internet and in books, both Linux-specific and pertaining to general UNIX questions. I'd recommend looking into the documentation subdirectories on any Linux FTP site for the LDP (Linux Documentation Project) books. This README is not meant to be documentation on the system: there are much better sources available.
- There are various README files in the Documentation/ subdirectory: these typically contain kernel-specific installation notes for some drivers for example. Please read the Documentation/process/changes.rst file, as it contains information about the problems, which may result by upgrading your kernel.

## 1.4 Installing the kernel source

- If you install the full sources, put the kernel tarball in a directory where you have permissions (e.g. your home directory) and unpack it:

```
xz -cd linux-5.x.tar.xz | tar xvf -
```

Replace “X” with the version number of the latest kernel.

Do NOT use the /usr/src/linux area! This area has a (usually incomplete) set of kernel headers that are used by the library header files. They should match the library, and not get messed up by whatever the kernel-du-jour happens to be.

- You can also upgrade between 5.x releases by patching. Patches are distributed in the xz format. To install by patching, get all the newer patch files, enter the top level directory of the kernel source (linux-5.x) and execute:

```
xz -cd ../patch-5.x.xz | patch -p1
```

Replace “x” for all versions bigger than the version “x” of your current source tree, **in\_order**, and you should be ok. You may want to remove the backup files (some-file-name~ or some-file-name.orig), and make sure that there are no failed patches (some-file-name# or some-file-name.rej). If there are, either you or I have made a mistake.

Unlike patches for the 5.x kernels, patches for the 5.x.y kernels (also known as the -stable kernels) are not incremental but instead apply directly to the base 5.x kernel. For example, if your base kernel is 5.0 and you want to apply the 5.0.3 patch, you must not first apply the 5.0.1 and 5.0.2 patches. Similarly, if you are running kernel version 5.0.2 and want to jump to 5.0.3, you must first reverse the 5.0.2 patch (that is, patch -R) **before** applying the 5.0.3 patch. You can read more on this in Documentation/process/applying-patches.rst.

Alternatively, the script patch-kernel can be used to automate this process. It determines the current kernel version and applies any patches found:

```
linux/scripts/patch-kernel linux
```

The first argument in the command above is the location of the kernel source. Patches are applied from the current directory, but an alternative directory can be specified as the second argument.

- Make sure you have no stale .o files and dependencies lying around:

```
cd linux  
make mrproper
```

You should now have the sources correctly installed.

## 1.5 Software requirements

Compiling and running the 5.x kernels requires up-to-date versions of various software packages. Consult Documentation/process/changes.rst for the minimum version numbers required and how to get updates for these packages. Beware that using excessively old versions of these packages can cause indirect errors that are very difficult to track down, so don't assume that you can just update packages when obvious problems arise during build or operation.

## 1.6 Build directory for the kernel

When compiling the kernel, all output files will per default be stored together with the kernel source code. Using the option `make O=output_dir` allows you to specify an alternate place for the output files (including `.config`). Example:

```
kernel source code: /usr/src/linux-5.x  
build directory: /home/name/build/kernel
```

To configure and build the kernel, use:

```
cd /usr/src/linux-5.x  
make O=/home/name/build/kernel menuconfig  
make O=/home/name/build/kernel  
sudo make O=/home/name/build/kernel modules_install install
```

Please note: If the `O=output_dir` option is used, then it must be used for all invocations of `make`.

## 1.7 Configuring the kernel

Do not skip this step even if you are only upgrading one minor version. New configuration options are added in each release, and odd problems will turn up if the configuration files are not set up as expected. If you want to carry your existing configuration to a new version with minimal work, use `make oldconfig`, which will only ask you for the answers to new questions.

- Alternative configuration commands are:

<code>"make config"</code>	Plain text interface.
<code>"make menuconfig"</code>	Text based color menus, radiolists & dialogs.
<code>"make nconfig"</code>	Enhanced text based color menus.
<code>"make xconfig"</code>	Qt based configuration tool.
<code>"make gconfig"</code>	GTK+ based configuration tool.
<code>"make oldconfig"</code>	Default all questions based on the contents of your existing <code>./.config</code> file and asking about new config symbols.
<code>"make olddefconfig"</code>	Like above, but sets new symbols to their default values without prompting.
<code>"make defconfig"</code>	Create a <code>./.config</code> file by using the symbol values from either <code>arch/\$ARCH/defconfig</code> or <code>arch/\$ARCH/configs/\${PLATFORM}_defconfig</code> , depending on the architecture.
<code>"make \${PLATFORM}_defconfig"</code>	Create a <code>./.config</code> file by using the symbol values from <code>arch/\$ARCH/configs/\${PLATFORM}_defconfig</code> . Use "make help" to get a list of all available platforms of your architecture.

(continues on next page)

(continued from previous page)

```

"make allyesconfig"           Create a ./config file by setting ↵
    ↪symbol                  values to 'y' as much as possible.

"make allmodconfig"          Create a ./config file by setting ↵
    ↪symbol                  values to 'm' as much as possible.

"make allnoconfig"           Create a ./config file by setting ↵
    ↪symbol                  values to 'n' as much as possible.

"make randconfig"            Create a ./config file by setting ↵
    ↪symbol                  values to random values.

"make localmodconfig"        Create a config based on current ↵
    ↪config and                loaded modules (lsmod). Disables ↵
    ↪any module               option that is not needed for the ↵
    ↪loaded modules.           loaded modules.

    ↪another machine,          To create a localmodconfig for ↵
    ↪into a file               store the lsmod of that machine ↵
    ↪parameter.                and pass it in as a LSMOD ↵

    ↪certain folders           Also, you can preserve modules in ↵
    ↪their paths in           or kconfig files by specifying ↵
                                parameter LMC_KEEP.

target$ lsmod > /tmp/mylsmod
target$ scp /tmp/mylsmod host:/tmp

host$ make LSMOD=/tmp/mylsmod \
        LMC_KEEP="drivers/usb:drivers/
    ↪gpu:fs" \
        localmodconfig

    ↪compiling.                The above also works when cross ↵
                                compiling.

```

(continues on next page)

(continued from previous page)

```
"make localyesconfig" Similar to localmodconfig, except it will convert
    ↵ all module options to built in (=y) options. You can
        ↵ also preserve modules by LMC_KEEP.

"make kvmconfig"   Enable additional options for kvm guest kernel support.

"make xenconfig"   Enable additional options for xen dom0 guest kernel support.

"make tinyconfig"  Configure the tiniest possible kernel.
```

You can find more information on using the Linux kernel config tools in Documentation/kbuild/kconfig.rst.

- NOTES on make config:

- Having unnecessary drivers will make the kernel bigger, and can under some circumstances lead to problems: probing for a nonexistent controller card may confuse your other controllers.
- A kernel with math-emulation compiled in will still use the co-processor if one is present: the math emulation will just never get used in that case. The kernel will be slightly larger, but will work on different machines regardless of whether they have a math coprocessor or not.
- The “kernel hacking” configuration details usually result in a bigger or slower kernel (or both), and can even make the kernel less stable by configuring some routines to actively try to break bad code to find kernel problems (kmalloc()). Thus you should probably answer ‘n’ to the questions for “development”, “experimental”, or “debugging” features.

## 1.8 Compiling the kernel

- Make sure you have at least gcc 4.9 available. For more information, refer to Documentation/process/changes.rst.

Please note that you can still run a.out user programs with this kernel.

- Do a make to create a compressed kernel image. It is also possible to do make install if you have lilo installed to suit the kernel makefiles, but you may want to check your particular lilo setup first.

To do the actual install, you have to be root, but none of the normal build should require that. Don’t take the name of root in vain.

- If you configured any of the parts of the kernel as `modules`, you will also have to do `make modules_install`.
- Verbose kernel compile/build output:

Normally, the kernel build system runs in a fairly quiet mode (but not totally silent). However, sometimes you or other kernel developers need to see compile, link, or other commands exactly as they are executed. For this, use “verbose” build mode. This is done by passing `V=1` to the `make` command, e.g.:

```
make V=1 all
```

To have the build system also tell the reason for the rebuild of each target, use `V=2`. The default is `V=0`.

- Keep a backup kernel handy in case something goes wrong. This is especially true for the development releases, since each new release contains new code which has not been debugged. Make sure you keep a backup of the modules corresponding to that kernel, as well. If you are installing a new kernel with the same version number as your working kernel, make a backup of your modules directory before you do a `make modules_install`.

Alternatively, before compiling, use the kernel config option “`LOCALVERSION`” to append a unique suffix to the regular kernel version. `LOCALVERSION` can be set in the “General Setup” menu.

- In order to boot your new kernel, you’ll need to copy the kernel image (e.g. `.../linux/arch/x86/boot/bzImage` after compilation) to the place where your regular bootable kernel is found.
- Booting a kernel directly from a floppy without the assistance of a bootloader such as LILO, is no longer supported.

If you boot Linux from the hard drive, chances are you use LILO, which uses the kernel image as specified in the file `/etc/lilo.conf`. The kernel image file is usually `/vmlinuz`, `/boot/vmlinuz`, `/bzImage` or `/boot/bzImage`. To use the new kernel, save a copy of the old image and copy the new image over the old one. Then, you MUST RERUN LILO to update the loading map! If you don’t, you won’t be able to boot the new kernel image.

Reinstalling LILO is usually a matter of running `/sbin/lilo`. You may wish to edit `/etc/lilo.conf` to specify an entry for your old kernel image (say, `/vmlinuz.old`) in case the new one does not work. See the LILO docs for more information.

After reinstalling LILO, you should be all set. Shutdown the system, reboot, and enjoy!

If you ever need to change the default root device, video mode, etc. in the kernel image, use your bootloader’s boot options where appropriate. No need to recompile the kernel to change these parameters.

- Reboot with the new kernel and enjoy.

## 1.9 If something goes wrong

- If you have problems that seem to be due to kernel bugs, please check the file MAINTAINERS to see if there is a particular person associated with the part of the kernel that you are having trouble with. If there isn't anyone listed there, then the second best thing is to mail them to me ([torvalds@linux-foundation.org](mailto:torvalds@linux-foundation.org)), and possibly to any other relevant mailing-list or to the news-group.
- In all bug-reports, *please* tell what kernel you are talking about, how to duplicate the problem, and what your setup is (use your common sense). If the problem is new, tell me so, and if the problem is old, please try to tell me when you first noticed it.
- If the bug results in a message like:

```
unable to handle kernel paging request at address C0000010
Oops: 0002
EIP: 0010:XXXXXXXX
eax: xxxxxxxx ebx: xxxxxxxx ecx: xxxxxxxx edx: xxxxxxxx
esi: xxxxxxxx edi: xxxxxxxx ebp: xxxxxxxx
ds: xxxx es: xxxx fs: xxxx gs: xxxx
Pid: xx, process nr: xx
xx xx xx xx xx xx xx xx xx xx
```

or similar kernel debugging information on your screen or in your system log, please duplicate it *exactly*. The dump may look incomprehensible to you, but it does contain information that may help debugging the problem. The text above the dump is also important: it tells something about why the kernel dumped code (in the above example, it's due to a bad kernel pointer). More information on making sense of the dump is in [Bug hunting](#)

- If you compiled the kernel with CONFIG\_KALLSYMS you can send the dump as is, otherwise you will have to use the `ksymoops` program to make sense of the dump (but compiling with CONFIG\_KALLSYMS is usually preferred). This utility can be downloaded from <https://www.kernel.org/pub/linux/utils/kernel/ksymoops/>. Alternatively, you can do the dump lookup by hand:
- In debugging dumps like the above, it helps enormously if you can look up what the EIP value means. The hex value as such doesn't help me or anybody else very much: it will depend on your particular kernel setup. What you should do is take the hex value from the EIP line (ignore the `0010:`), and look it up in the kernel namelist to see which kernel function contains the offending address.

To find out the kernel function name, you'll need to find the system binary associated with the kernel that exhibited the symptom. This is the file 'linux/vmlinux'. To extract the namelist and match it against the EIP from the kernel crash, do:

```
nm vmlinux | sort | less
```

This will give you a list of kernel addresses sorted in ascending order, from which it is simple to find the function that contains the offending address.

Note that the address given by the kernel debugging messages will not necessarily match exactly with the function addresses (in fact, that is very unlikely), so you can't just ‘grep’ the list: the list will, however, give you the starting point of each kernel function, so by looking for the function that has a starting address lower than the one you are searching for but is followed by a function with a higher address you will find the one you want. In fact, it may be a good idea to include a bit of “context” in your problem report, giving a few lines around the interesting one.

If you for some reason cannot do the above (you have a pre-compiled kernel image or similar), telling me as much about your setup as possible will help. Please read the [\*admin-guide/reporting-bugs.rst\*](#) document for details.

- Alternatively, you can use gdb on a running kernel. (read-only; i.e. you cannot change values or set break points.) To do this, first compile the kernel with -g; edit arch/x86/Makefile appropriately, then do a make clean. You'll also need to enable CONFIG\_PROC\_FS (via make config).

After you've rebooted with the new kernel, do `gdb vmlinux /proc/kcore`. You can now use all the usual gdb commands. The command to look up the point where your system crashed is `l *0xFFFFFFFF`. (Replace the XXXXes with the EIP value.)

gdb'ing a non-running kernel currently fails because gdb (wrongly) disregards the starting offset for which the kernel is compiled.

---

**CHAPTER  
TWO**

---

## **THE KERNEL' S COMMAND-LINE PARAMETERS**

The following is a consolidated list of the kernel parameters as implemented by the `_setup()`, `core_param()` and `module_param()` macros and sorted into English Dictionary order (defined as ignoring all punctuation and sorting digits before letters in a case insensitive manner), and with descriptions where known.

The kernel parses parameters from the kernel command line up to “`--`”; if it doesn’t recognize a parameter and it doesn’t contain a ‘`.`’, the parameter gets passed to init: parameters with ‘`=`’ go into init’s environment, others are passed as command line arguments to init. Everything after “`--`” is passed as an argument to init.

Module parameters can be specified in two ways: via the kernel command line with a module name prefix, or via modprobe, e.g.:

```
(kernel command line) usbcore.blinkenlights=1  
(modprobe command line) modprobe usbcore blinkenlights=1
```

Parameters for modules which are built into the kernel need to be specified on the kernel command line. modprobe looks through the kernel command line (`/proc/cmdline`) and collects module parameters when it loads a module, so the kernel command line can be used for loadable modules too.

Hyphens (dashes) and underscores are equivalent in parameter names, so:

```
log_buf_len=1M print-fatal-signals=1
```

can also be entered as:

```
log-buf-len=1M print_fatal_signals=1
```

Double-quotes can be used to protect spaces in values, e.g.:

```
param="spaces in here"
```

## 2.1 cpu lists:

Some kernel parameters take a list of CPUs as a value, e.g. isolcpus, nohz\_full, irqaffinity, rCU\_nocbs. The format of this list is:

```
<cpu number>,<cpu number>,...<cpu number>
```

or

```
<cpu number>-<cpu number> (must be a positive range in ascending  
order)
```

or a mixture

```
<cpu number>,<cpu number>,...<cpu number>-<cpu number>
```

Note that for the special case of a range one can split the range into equal sized groups and for each group use some amount from the beginning of that group:

```
<cpu number>-<cpu number>:<used size>/<group size>
```

For example one can add to the command line following parameter:

```
isolcpus=1,2,10-20,100-2000:2/25
```

where the final item represents CPUs 100,101,125,126,150,151,...

This document may not be entirely up to date and comprehensive. The command “modinfo -p \${modulename}” shows a current list of all parameters of a loadable module. Loadable modules, after being loaded into the running kernel, also reveal their parameters in /sys/module/\${modulename}/parameters/. Some of these parameters may be changed at runtime by the command echo -n \${value} > /sys/module/\${modulename}/parameters/\${parm}.

The parameters listed below are only valid if certain kernel build options were enabled and if respective hardware is present. The text in square brackets at the beginning of each description states the restrictions within which a parameter is applicable:

ACPI	ACPI support is enabled.
AGP	AGP (Accelerated Graphics Port) is enabled.
ALSA	ALSA sound support is enabled.
APIC	APIC support is enabled.
APM	Advanced Power Management support is enabled.
ARM	ARM architecture is enabled.
ARM64	ARM64 architecture is enabled.
AX25	Appropriate AX.25 support is enabled.
CLK	Common clock infrastructure is enabled.
CMA	Contiguous Memory Area support is enabled.
DRM	Direct Rendering Management support is enabled.
DYNAMIC_DEBUG	Build in debug messages and enable them at runtime
EDD	BIOS Enhanced Disk Drive Services (EDD) is enabled

(continues on next page)

(continued from previous page)

EFI	EFI Partitioning (GPT) is enabled
EIDE	EIDE/ATAPI support is enabled.
EVM	Extended Verification Module
FB	The frame buffer device is enabled.
FTRACE	Function tracing enabled.
GCOV	GCOV profiling is enabled.
HW	Appropriate hardware is enabled.
IA-64	IA-64 architecture is enabled.
IMA	Integrity measurement architecture is enabled.
IOSCHED	More than one I/O scheduler is enabled.
IP_PNP	IP DHCP, BOOTP, or RARP is enabled.
IPV6	IPv6 support is enabled.
ISAPNP	ISA PnP code is enabled.
ISDN	Appropriate ISDN support is enabled.
ISOL	CPU Isolation is enabled.
JOY	Appropriate joystick support is enabled.
KGDB	Kernel debugger support is enabled.
KVM	Kernel Virtual Machine support is enabled.
LIBATA	Libata driver is enabled
LP	Printer support is enabled.
LOOP	Loopback device support is enabled.
M68k	M68k architecture is enabled. These options have more detailed description inside of <a href="#">Documentation/m68k/kernel-options.rst</a> .
MDA	MDA console support is enabled.
MIPS	MIPS architecture is enabled.
MOUSE	Appropriate mouse support is enabled.
MSI	Message Signaled Interrupts (PCI).
MTD	MTD (Memory Technology Device) support is enabled.
NET	Appropriate network support is enabled.
NUMA	NUMA support is enabled.
NFS	Appropriate NFS support is enabled.
OF	Devicetree is enabled.
OSS	OSS sound support is enabled.
PV_OPS	A paravirtualized kernel is enabled.
PARIDE	The ParIDE (parallel port IDE) subsystem is enabled.
PARISC	The PA-RISC architecture is enabled.
PCI	PCI bus support is enabled.
PCIE	PCI Express support is enabled.
PCMCIA	The PCMCIA subsystem is enabled.
PNP	Plug & Play support is enabled.
PPC	PowerPC architecture is enabled.
PPT	Parallel port support is enabled.
PS2	Appropriate PS/2 support is enabled.
RAM	RAM disk support is enabled.
RDT	Intel Resource Director Technology.
S390	S390 architecture is enabled.
SCSI	Appropriate SCSI support is enabled.

(continues on next page)

(continued from previous page)

A lot of drivers have their options described inside the Documentation/scsi/ sub-directory.	
SECURITY Different security models are enabled.	
SELINUX SELinux support is enabled.	
APPARMOR AppArmor support is enabled.	
SERIAL Serial support is enabled.	
SH SuperH architecture is enabled.	
SMP The kernel is an SMP kernel.	
SPARC Sparc architecture is enabled.	
SWSUSP Software suspend (hibernation) is enabled.	
SUSPEND System suspend states are enabled.	
TPM TPM drivers are enabled.	
TS Appropriate touchscreen support is enabled.	
UMS USB Mass Storage support is enabled.	
USB USB support is enabled.	
USBHID USB Human Interface Device support is enabled.	
V4L Video For Linux support is enabled.	
VMMIO Driver for memory mapped virtio devices is enabled.	
VGA The VGA console has been enabled.	
VT Virtual terminal support is enabled.	
WDT Watchdog support is enabled.	
XT IBM PC/XT MFM hard disk support is enabled.	
X86-32 X86-32, aka i386 architecture is enabled.	
X86-64 X86-64 architecture is enabled. More X86-64 boot options can be found in Documentation/x86/x86_64/boot-options.rst.	
X86 Either 32-bit or 64-bit x86 (same as X86-32+X86-64)	
X86_UV SGI UV support is enabled.	
XEN Xen support is enabled	

In addition, the following text indicates that the option:

BUGS=	Relates to possible processor bugs on the said processor.
KNL	Is a kernel start-up parameter.
BOOT	Is a boot loader parameter.

Parameters denoted with BOOT are actually interpreted by the boot loader, and have no meaning to the kernel directly. Do not modify the syntax of boot loader parameters without extreme need or coordination with <Documentation/x86/boot.rst>.

There are also arch-specific kernel-parameters not documented here. See for example <Documentation/x86/x86\_64/boot-options.rst>.

Note that ALL kernel parameters listed below are CASE SENSITIVE, and that a trailing = on the name of any parameter states that that parameter will be entered as an environment variable, whereas its absence indicates that it will appear as a kernel argument readable via /proc/cmdline by programs running once the system is up.

The number of kernel parameters is not limited, but the length of the complete command line (parameters including spaces etc.) is limited to a fixed num-

ber of characters. This limit depends on the architecture and is between 256 and 4096 characters. It is defined in the file ./include/asm/setup.h as COMMAND\_LINE\_SIZE.

Finally, the [KMG] suffix is commonly described after a number of kernel parameter values. These ‘K’ , ‘M’ , and ‘G’ letters represent the \_binary\_ multipliers ‘Kilo’ , ‘Mega’ , and ‘Giga’ , equaling  $2^{10}$ ,  $2^{20}$ , and  $2^{30}$  bytes respectively. Such letter suffixes can also be entirely omitted:

```
acpi=      [HW,ACPI,X86,ARM64]
           Advanced Configuration and Power Interface
           Format: { force | on | off | strict | noirq |
→| rsdt |
           copy_dsdт }
           force -- enable ACPI if default was off
           on -- enable ACPI but allow fallback to DT_
→[arm64]
           off -- disable ACPI if default was on
           noirq -- do not use ACPI for IRQ routing
           strict -- Be less tolerant of platforms_
→that are not
           strictly ACPI specification_
→compliant.

→"acpi=force"
           are available

           See also Documentation/power/runtime_pm.rst,
→ pci=noacpi

           acpi_apic_instance= [ACPI, IOAPIC]
           Format: <int>
           2: use 2nd APIC table, if available
           1,0: use 1st APIC table
           default: 0

           acpi_backlight= [HW,ACPI]
           { vendor | video | native | none }
           If set to vendor, prefer vendor-specific_
→driver
           (e.g. thinkpad_acpi, sony_acpi, etc._)
→instead
           of the ACPI video.ko driver.
           If set to video, use the ACPI video.ko_
→driver.
           If set to native, use the device's native_
→backlight mode.
           If set to none, disable the ACPI backlight_
→interface.
```

```
acpi_force_32bit_fadt_addr
    force FADT to use 32 bit addresses rather than the
    broken 64 bit addresses. Some firmware have and use
    the older legacy 32 bit addresses.
```

```
acpica_no_return_repair [HW, ACPI]
    Disable AML predefined validation mechanism
    This mechanism can repair the evaluation result to make
    the return objects more ACPI specification compliant.
    This option is useful for developers to identify the
    root cause of an AML interpreter issue when the issue
    has something to do with the repair mechanism.
```

```
acpi.debug_layer=      [HW,ACPI,ACPI_DEBUG]
acpi.debug_level=     [HW,ACPI,ACPI_DEBUG]
    Format: <int>
    CONFIG_ACPI_DEBUG must be enabled to produce any ACPI
    debug output. Bits in debug_layer correspond to a
    _COMPONENT in an ACPI source file, e.g.,
        #define _COMPONENT ACPI_PCI_COMPONENT
    Bits in debug_level correspond to a level in
    ACPI_DEBUG_PRINT statements, e.g.,
        ACPI_DEBUG_PRINT((ACPI_DB_INFO, ...
    The debug_level mask defaults to "info".
```

See Documentation/firmware-guide/acpi/debug.rst for more information about debug layers and levels.

```
Enable processor driver info messages:
    acpi.debug_layer=0x20000000
Enable PCI/PCI interrupt routing info
messages:
    acpi.debug_layer=0x400000
Enable AML "Debug" output, i.e., stores to object while interpreting AML:
    acpi.debug_layer=0xffffffff acpi.debug_level=0x2
Enable all messages related to ACPI
```

```

→hardware:
      acpi.debug_layer=0x2 acpi.debug_
→level=0xffffffff

→system is
      Some values produce so much output that the_
unusable. The "log_buf_len" parameter may_
if you need to capture more output.

      acpi_enforce_resources= [ACPI]
          { strict | lax | no }
          Check for resource conflicts between native_
and ACPI OperationRegions (SystemIO and_
only). IO ports and memory declared in ACPI_
used by the ACPI subsystem in arbitrary AML_
can interfere with legacy drivers.
          strict (default): access to resources_
is denied; legacy drivers trying to access_
resources will fail to bind to device using_
lax: access to resources claimed by ACPI is_
legacy drivers trying to access reserved_
will bind successfully but a warning_
no: ACPI OperationRegions are not marked as_
no further checks are performed.

      acpi_force_table_verification [HW,ACPI]
          Enable table checksum verification during_
early stage.
          By default, this is disabled due to x86_
early mapping
          size limitation.

      acpi_irq_balance [HW,ACPI]
          ACPI will balance active IRQs
          default in APIC mode

      acpi_irq_nobalance [HW,ACPI]
          ACPI will not move active IRQs (default)
          default in PIC mode

```

acpi\_irq\_isa= [HW,ACPI] If irq\_balance, mark listed IRQs used by ISA  
↳ for Format: <irq>,<irq>...

acpi\_irq\_pci= [HW,ACPI] If irq\_balance, clear listed IRQs for use by PCI  
↳ for Format: <irq>,<irq>...

acpi\_mask\_gpe= [HW,ACPI]  
↳ GPEs triggered Due to the existence of \_Lxx/\_Exx, some by unsupported hardware/firmware features  
↳ can result in GPE floodings that cannot be automatically disabled by the GPE dispatcher.  
↳ uncontrolled This facility can be used to prevent such GPE floodings.  
Format: <byte>

acpi\_no\_auto\_serialize [HW,ACPI]  
Disable auto-serialization of AML methods  
AML control methods that contain the  
↳ opcodes to create named objects will be marked as  
↳ "Serialized" by the auto-serialization feature.  
This feature is enabled by default.  
This option allows to turn off the feature.

acpi\_no\_memhotplug [ACPI] Disable memory hotplug. Useful for kdump kernels.

acpi\_no\_static\_ssdt [HW,ACPI]  
Disable installation of static SSDTs at  
↳ early boot time By default, SSDTs contained in the RSDT/  
↳ XSDT will be installed automatically and they will  
↳ appear under /sys/firmware/acpi/tables.  
This option turns off this feature.  
Note that specifying this option does not  
affect dynamic table installation which will  
install SSDT tables to /sys/firmware/acpi/tables/dynamic.

```

acpi_no_watchdog      [HW,ACPI,WDT]
Ignore the ACPI-based watchdog interface
→(WDAT) and let
a native driver control the watchdog device
→instead.

acpi_rsdp=          [ACPI,EFI,KEXEC]
Pass the RSDP address to the kernel, mostly
→used
on machines running EFI runtime service to
boot the
second kernel for kdump.

acpi_os_name=       [HW,ACPI] Tell ACPI BIOS the name of the OS
Format: To spoof as Windows 98: ="Microsoft
→Windows"

acpi_rev_override [ACPI] Override the _REV object to return
→5 (instead
of 2 which is mandated by ACPI 6) as the
supported ACPI
specification revision (when using this
switch, it may
be necessary to carry out a cold reboot _
twice_ in a
row to make it take effect on the platform
firmware).

acpi_osi=          [HW,ACPI] Modify list of supported OS
→interface strings
acpi_osi="string1"    # add string1
acpi_osi="!string2"    # remove string2
acpi_osi="!*           # remove all strings
acpi_osi="!             # disable all
built-in OS vendor
strings
acpi_osi=!!           # enable all
acpi_osi=              strings
# disable all
→built-in OS vendor
→strings
acpi_osi=              # disable all
with single or
multiple 'acpi_osi="string1"' to support
specific OS
vendor string(s). Note that such command
can only
affect the default state of the OS vendor
→strings, thus

```

→feature group  
→vendor strings,  
→command line  
→when one do not  
→strings which  
is equivalent  
→', they all  
with other  
will not  
such command can  
specifying it  
is also  
→Locall1)  
with single or  
specific  
affect the  
and the  
multiple times  
But it may  
a string if  
This command

it cannot affect the default state of the strings and the current state of the OS specifying it multiple times through kernel is meaningless. This command is useful care about the state of the feature group should be controlled by the OSPM.  
Examples:  
1. 'acpi\_osi!= acpi\_osi="Windows 2000"'  
to 'acpi\_osi="Windows 2000" acpi\_osi!='  
can make '\_OSI("Windows 2000")' TRUE.  
'acpi\_osi=' cannot be used in combination 'acpi\_osi=' command lines, the \_OSI method exist in the ACPI namespace. NOTE that only affect the \_OSI support state, thus multiple times through kernel command line meaningless.  
Examples:  
1. 'acpi\_osi=' can make 'CondRefOf(\_OSI,  
FALSE.  
'acpi\_osi!=\*' can be used in combination multiple 'acpi\_osi="string1"' to support string(s). Note that such command can current state of both the OS vendor strings feature group strings, thus specifying it through kernel command line is meaningful. still not able to affect the final state of there are quirks related to this string. is useful when one want to control the

→ state of the feature group strings to debug BIOS issues ↵ related to the OSPM features.

Examples:

1. 'acpi\_osi="Module Device" acpi\_osi!=\*' ↵ '\_OSI("Module Device")' FALSE.
2. 'acpi\_osi!=\* acpi\_osi="Module Device"' ↵ '\_OSI("Module Device")' TRUE.
3. 'acpi\_osi!=! acpi\_osi!=\* acpi\_ osi="Windows 2000"' is equivalent to 'acpi\_osi!=\* acpi\_osi!=! acpi\_ osi="Windows 2000"' and 'acpi\_osi!=\* acpi\_osi="Windows 2000"' ↵ they all will make '\_OSI("Windows 2000")' TRUE.

acpi\_pm\_good [X86]  
Override the pmtimer bug detection: force  
the kernel to assume that this machine's pmtimer  
latches its value and always returns good values.

acpi\_sci= [HW,ACPI] ACPI System Control Interrupt  
trigger mode Format: { level | edge | high | low }

acpi\_skip\_timer\_override [HW,ACPI]  
Recognize and ignore IRQ0/pin2 Interrupt ↵Override.  
For broken nForce2 BIOS resulting in XT-PIC ↵timer

```
acpi_sleep= [HW,ACPI] Sleep options
Format: { s3_bios, s3_mode, s3_beep, s4_
˓→nohwsig,
˓→enable, nobl }
˓→information on
˓→speaker beep
˓→point is called.
```

old\_ordering, nonvs, sci\_force\_

See Documentation/power/video.rst for s3\_bios and s3\_mode.  
s3\_beep is for debugging; it makes the PC's as soon as the kernel's real-mode entry.

↳ from being s4\_nohwsig prevents ACPI hardware signature used during resume from hibernation.  
↳ of the \_PTS old\_ordering causes the ACPI 1.0 ordering control method, with respect to putting devices into low power states, to be enforced (the ACPI of \_PTS is used by default).  
↳ 2.0 ordering nonvs prevents the kernel from saving/ restoring the ACPI NVS memory during suspend/hibernation.  
↳ SCI\_EN directly sci\_force\_enable causes the kernel to set on resume from S1/S3 (which is against the but some broken systems don't work without nobl causes the internal blacklist of behave incorrectly in some ways with suspend and resume to be ignored (use wisely).  
↳ systems known to respect to system acpi\_use\_timer\_override [HW,ACPI]  
↳ NF5 boards Use timer override. For some broken Nvidia that require a timer override, but don't have HPET  
↳ chipsets  
↳ corruption) add\_efi\_memmap [EFI; X86] Include EFI memory map in kernel's map of available physical RAM.  
agp= [AGP]  
{ off | try\_unsupported }  
off: disable AGP support  
try\_unsupported: try to drive unsupported  
↳ chipsets  
↳ corruption) (may crash computer or cause data  
ALSA [HW,ALSA]  
↳ rst See Documentation/sound/alsa-configuration.  
alignment= [KNL,ARM]  
↳ handler Allow the default userspace alignment fault

behaviour to be specified. Bit 0 enables ↵  
 ↵warnings, ↵  
 ↵bit 1 enables fixups, and bit 2 sends a ↵  
 ↵segfault.

align\_va\_addr= [X86-64]  
 ↵[14:12] when  
 ↵This option  
 ↵on AMD F15h  
 ↵for a  
 ↵vary highly in  
 ↵compiler.

Align virtual addresses by clearing slice ↵  
 ↵allocating a VMA at process creation time. ↵  
 ↵gives you up to 3% performance improvement ↵  
 ↵machines (where it is enabled by default) ↵  
 ↵CPU-intensive style benchmark, and it can ↵  
 ↵a microbenchmark depending on workload and ↵

32: only for 32-bit processes  
 64: only for 64-bit processes  
 on: enable for both 32- and 64-bit processes  
 off: disable for both 32- and 64-bit ↵  
 ↵processes

alloc\_snapshot [FTRACE]  
 ↵up when the  
 ↵debugging  
 ↵boot up, and  
 ↵as it needs  
 ↵allowed.

Allocate the ftrace snapshot buffer on boot ↵  
 ↵main buffer is allocated. This is handy if ↵  
 ↵and you need to use tracing\_snapshot() on ↵  
 ↵do not want to use tracing\_snapshot\_alloc() ↵  
 ↵to be done where GFP\_KERNEL allocations are ↵

amd\_iommu= [HW,X86-64]  
 ↵the system.

Pass parameters to the AMD IOMMU driver in ↵  
 ↵Possible values are:  
 ↵fullflush - enable flushing of IO/TLB ↵  
 ↵they are unmapped. Otherwise ↵  
 ↵flushed before they will be ↵  
 ↵is a lot of faster  
 ↵off - do not initialize any AMD IOMMU ↵  
 ↵the system

force\_isolation - Force device isolation  
for all devices. The IOMMU driver  
is not allowed anymore to lift  
isolation requirements as needed.  
This option does not override iommu=pt

amd\_iommu\_dump= [HW,X86-64]  
Enable AMD IOMMU driver option to dump the  
ACPI table for AMD IOMMU. With this option enabled,  
AMD IOMMU driver will print ACPI tables for AMD IOMMU  
during IOMMU initialization.

amd\_iommu\_intr= [HW,X86-64]  
Specifies one of the following AMD IOMMU  
interrupt remapping modes:  
legacy - Use legacy interrupt remapping  
vapic - Use virtual APIC mode, which  
allows IOMMU to inject interrupts directly  
into guest.  
This mode requires kvm-amd.  
avic=1.  
(Default when IOMMU HW support  
is present.)

amijoy.map= [HW,JOY] Amiga joystick support  
Map of devices attached to JOY0DAT and  
JOY1DAT  
Format: <a>,<b>  
See also Documentation/input/joydev/  
joystick.rst

analog.map= [HW,JOY] Analog joystick and gamepad support  
Specifies type or capabilities of an analog  
joystick connected to one of 16 gameports  
Format: <type1>,<type2>,...<type16>

apc= [HW,SPARC]  
Power management functions (SPARCstation-4/  
5 + deriv.)  
Format: noidle

Disable APC CPU standby support.  
 ↵SPARCstation-Fox does not play well with APC CPU idle - disable  
 ↵it if you have APC and your system crashes randomly.

apic= [APIC,X86] Advanced Programmable Interrupt  
 ↵Controller Change the output verbosity while booting Format: { quiet (default) | verbose | debug }  
 ↵}  
 ↵output Change the amount of debugging information when initialising the APIC and IO-API  
 ↵components. For X86-32, this can also be used to driver name.  
 ↵specify an APIC Format: apic=driver\_name Examples: apic=bigsmp

apic\_extnmi= [APIC,X86] External NMI delivery setting Format: { bsp (default) | all | none } bsp: External NMI is delivered only to CPU  
 ↵0 all: External NMIs are broadcast to all backup of CPU 0 none: External NMI is masked for all CPUs. useful so that a dump capture kernel shot down by NMI

autoconf= [IPV6]  
 See Documentation/networking/ipv6.rst.

show\_lapic= [APIC,X86] Advanced Programmable Interrupt  
 ↵Controller Limit apic dumping. The parameter defines the maximal number of local apics being dumped. Also it is possible to set it to "all" by meaning -- no limit.  
 ↵the maximal ↵is possible ↵here. Format: { 1 (default) | 2 | ... | all }. The parameter valid if only apic=debug or apic=verbose is specified. Example: apic=debug show\_lapic=all

apm= [APM] Advanced Power Management

See header of arch/x86/kernel/apm\_32.c.

**arcrimi=** [HW,NET] ARCnet - "RIM I" (entirely  
↳mem-mapped) cards Format: <io>,<irq>,<nodeID>

**ataflop=** [HW,M68k]

**atarimouse=** [HW,MOUSE] Atari Mouse

**atkbd.extra=** [HW] Enable extra LEDs and keys on IBM  
↳RapidAccess, EzKey and similar keyboards

**atkbd.reset=** [HW] Reset keyboard during initialization

**atkbd.set=** [HW] Select keyboard code set  
Format: <int> (2 = AT (default), 3 = PS/2)

**atkbd.scroll=** [HW] Enable scroll wheel on MS Office and  
↳similar keyboards

**atkbd.softraw=** [HW] Choose between synthetic and real raw  
↳mode Format: <bool> (0 = real, 1 = synthetic  
↳(default))

**atkbd.softrepeat=** [HW]  
Use software keyboard repeat

**audit=** [KNL] Enable the audit sub-system  
Format: { "0" | "1" | "off" | "on" }  
0 | off - kernel audit is disabled and can  
↳not be enabled until the next reboot  
unset - kernel audit is initialized but  
↳disabled and will be fully enabled by the userspace  
↳auditd.  
1 | on - kernel audit is initialized and  
↳partially enabled, storing at most audit\_backlog\_  
↳limit messages in RAM until it is fully  
↳enabled by the userspace auditd.  
Default: unset

**audit\_backlog\_limit=** [KNL] Set the audit queue size limit.  
Format: <int> (must be  $\geq 0$ )

Default: 64

bau= [X86\_UV] Enable the BAU on SGI UV. The behavior is to disable the BAU (i.e. bau=0). Format: { "0" | "1" }  
0 - Disable the BAU.  
1 - Enable the BAU.  
unset - Disable the BAU.

baycom\_epp= [HW,AX25]  
Format: <io>,<mode>

baycom\_par= [HW,AX25] BayCom Parallel Port AX.25 Modem  
Format: <io>,<mode>  
See header of drivers/net/hamradio/baycom\_par.c.

baycom\_ser\_fdx= [HW,AX25]  
BayCom Serial Port AX.25 Modem (Full Duplex)  
Format: <io>,<irq>,<mode>[,<baud>]  
See header of drivers/net/hamradio/baycom\_ser\_fdx.c.

baycom\_ser\_hdx= [HW,AX25]  
BayCom Serial Port AX.25 Modem (Half Duplex)  
Format: <io>,<irq>,<mode>  
See header of drivers/net/hamradio/baycom\_ser\_hdx.c.

blkdevparts= Manual partition parsing of block device(s)  
for embedded devices based on command line  
See Documentation/block/cmdline-partition.

boot\_delay= Milliseconds to delay each printk during boot.  
Values larger than 10 seconds (10000) are changed to no delay (0).  
Format: integer

bootconfig [KNL]  
to an initrd Extended command line options can be added and this will cause the kernel to look for it.

	See Documentation/admin-guide/bootconfig.rst
bert_disable	[ACPI] Disable BERT OS support on buggy BIOSes.
bgrt_disable	[ACPI][X86] Disable BGRT to avoid flickering OEM logo.
bttv.card= cards)	[HW,V4L] bttv (bt848 + bt878 based grabber) Most important insmod options are available
as bttv.radio=	kernel args too. See Documentation/admin-guide/media/bttv.rst
bttv pll= bttv.tuner=	
bulk_remove=off the pSeries entries	[PPC] This parameter disables the use of firmware feature for flushing multiple hpte at a time.
c101=	[NET] Moxa C101 synchronous serial card
cachesize= size detection. report the cache work arounds is not should be. situations.	[BUGS=X86-32] Override level 2 CPU cache Sometimes CPU hardware bugs make them size incorrectly. The kernel will attempt to fix known problems, but for some CPUs it possible to determine what the correct size This option provides an override for these
carrier_timeout= that carrier. By default	[NET] Specifies amount of time (in seconds) the kernel should wait for a network it waits 120 seconds.
ca_keys= key(s) on certificate	[KEYS] This parameter identifies a specific the system trusted keyring to be used for trust validation. format: { id:<keyid>   builtin }

```

    cca=
↳coherency [MIPS] Override the kernel pages' cache_
↳7 algorithm. Accepted values range from 0 to_
↳pgtable-bits.h inclusive. See arch/mips/include/asm/
↳Loongson3 and for platform specific values (SB1,_
others).

ccw_timeout_log [S390]
See Documentation/s390/common_io.rst for_
↳details.

cgroup_disable= [KNL] Disable a particular controller
Format: {name of the controller(s) to_
↳disable} The effects of cgroup_disable=foo are:
- foo isn't auto-mounted if you mount all_
↳cgroups in a single hierarchy
- foo isn't visible as an individually_
↳mountable subsystem
{Currently only "memory" controller deal_
↳with this and cut the overhead, others just disable the_
↳usage. So only cgroup_disable=memory is actually_
↳worthy}

cgroup_no_v1= [KNL] Disable cgroup controllers and named_
↳hierarchies in v1 Format: { { controller | "all" | "named" }
                           [, { controller | "all" | "named" }
                           ...] } Like cgroup_disable, but only applies to_
↳cgroup v1; the blacklisted controllers remain_
↳available in cgroup2. "all" blacklists all controllers and_
↳"named" disables named mounts. Specifying both "all" and_
↳"named" disables all v1 hierarchies.

cgroup.memory= [KNL] Pass options to the cgroup memory_
↳controller. Format: <string>
nosocket -- Disable socket memory_

```

↳ accounting.  
nokmem -- Disable kernel memory accounting.

↳ checkreqprot [SELINUX] Set initial checkreqprot flag.  
↳ value.  
Format: { "0" | "1" }  
See security/selinux/Kconfig help text.  
0 -- check protection applied by kernel.  
↳ (includes  
any implied execute protection).  
1 -- check protection requested by.  
Default value is set via a kernel config.  
↳ application.  
↳ option.  
Value can be changed at runtime via  
/sys/fs/selinux/checkreqprot.  
Setting checkreqprot to 1 is deprecated.

cio\_ignore= [S390]  
See Documentation/s390/common\_io.rst for.  
↳ details.  
clk\_ignore\_unused [CLK]  
Prevents the clock framework from.  
↳ automatically gating clocks that have not been explicitly.  
↳ enabled by a Linux device driver but are enabled in hardware.  
↳ at reset or by the bootloader/firmware. Note that this.  
↳ does not force such clocks to be always-on nor does.  
↳ it reserve those clocks in any way. This parameter is.  
↳ useful for debug and development, but should not be.  
↳ needed on a platform with proper driver support. For.  
↳ more information, see Documentation/driver-api/  
clk.rst.

clock= [BUGS=X86-32, HW] gettimeofday clocksource.  
↳ override.  
[Deprecated]  
Forces specified clocksource (if available).  
↳ to be used when calculating gettimeofday(). If.  
↳ specified clocksource is not available, it defaults.  
↳ to PIT.

```

Format: { pit | tsc | cyclone | pmtmr }

clocksource= Override the default clocksource
Format: <string>
Override the default clocksource and use
↪the clocksource with the name specified.
↪depending on Some clocksource names to choose from, ↪
↪clocksource) the platform:
[all] jiffies (this is the base, fallback)
↪1 [ACPI] acpi_pm
[ARM] imx_timer1,0STS,netx_timer,mpu_timer2,
      pxa_timer,timer3,32k_counter,timer0_
[X86-32] pit,hpet,tsc;
          scx200_hrt on Geode; cyclone on IBM
↪x440 [MIPS] MIPS
[PARISC] cr16
[S390] tod
[SH] SuperH
[SPARC64] tick
[X86-64] hpet,tsc

clocksource.arm_arch_timer.evtstrm=
[ARM,ARM64]
Format: <bool>
Enable/disable the eventstream feature of
↪the ARM architected timer so that code using
↪WFE-based polling loops can be debugged more effectively on
↪production systems.

clocksource.max_cswd_read_retries= [KNL]
Number of clocksource_watchdog() retries
↪due to external delays before the clock will be
↪marked unstable. Defaults to three retries, that
↪is, four attempts to read the clock under test.

clearcpuid=BITNUM[,BITNUM...] [X86]
Disable CPUID feature X for the kernel. See
arch/x86/include/asm/cpufeatures.h for the
↪valid bit numbers. Note the Linux specific bits are

```

↳ not necessarily  
↳ specific  
↳ directly  
↳ anything  
↳ from  
↳ cpubinfo.  
↳ you disable

stable over kernel options, but the vendor  
ones should be.  
Also note that user programs calling CPUID  
or using the feature without checking  
will still see it. This just prevents it  
being used by the kernel or shown in /proc/  
Also note the kernel might malfunction if  
some critical bits.

cma=nn[MG]@[start[MG][-end[MG]]]  
[KNL,CMA]  
Sets the size of kernel global memory area  
contiguous memory allocations and  
placement constraint by the physical  
memory allocations. A value of 0 disables  
altogether. For more information, see  
kernel/dma/contiguous.c

cma\_per numa=nn[MG]  
[ARM64,KNL]  
Sets the size of kernel per-numa memory  
contiguous memory allocations. A value of 0  
per-numa CMA altogether. And If this option  
specified, the default value is 0.  
With per-numa CMA enabled, DMA users on  
first try to allocate buffer from the  
which is located in node nid, if the  
they will fallback to the global default  
memory area.

cmo\_free\_hint= [PPC] Format: { yes | no }  
Specify whether pages are marked as being  
inactive  
when they are freed. This is used in CMO

↵environments  
 ↵stealing by  
 ↵atomic dma  
 ↵buffers)  
 ↵are of  
 ↵baud rate,  
 ↵number of  
 ↵or  
 ↵an

to determine OS memory pressure for pageu  
 a hypervisor.  
 Default: yes

coherent\_pool=nn[KMG] [ARM,KNL]  
 Sets the size of memory pool for coherent,u  
 allocations, by default set to 256K.

com20020=  
 Format:  
 <io>[,<irq>[,<nodeID>[,<backplane>[,<ckp>[  
 <timeout>]]]]]

com90io=  
 (I0-mapped buffers)  
 Format: <io>[,<irq>]

com90xx=  
 Format: <io>[,<irq>[,<memstart>]]

condev=  
 conmode=

console=[KNL] Output console device and options.  
 tty<n> Use the virtual console device <n>.  
 ttyS<n>[,options]  
 ttyUSB0[,options]  
 Use the specified serial port. The options,u  
 the form "bbbbpnf", where "bbbb" is the,u  
 "p" is parity ("n", "o", or "e"), "n" is,u  
 bits, and "f" is flow control ("r" for RTS,u  
 omit it). Default is "9600n8".

See Documentation/admin-guide/  
 serial-console.rst for more  
 information. See  
 Documentation/networking/netconsole.rst for,u  
 alternative.

```

uart[8250],io,<addr>[,options]
uart[8250],mmio,<addr>[,options]
uart[8250],mmio16,<addr>[,options]
uart[8250],mmio32,<addr>[,options]
uart[8250],0x<addr>[,options]
    Start an early, polled-mode console on the u
→8250/16550
address,  

→either 8-bit
→is assumed
→specified in
→if unspecified,
→is for
→but a braille
→instance
→may not be
→text\n"
→loglevel
→by syslog()
→or to reading

UART at the specified I/O port or MMIO u
switching to the matching ttyS device later.
MMIO inter-register address stride is u
(mmio), 16-bit (mmio16), or 32-bit (mmio32).
If none of [io|mmio|mmio16|mmio32], <addr>u
to be equivalent to 'mmio'. 'options' are u
the same format described for ttyS above; u
the h/w is not re-initialized.

hvc<n> Use the hypervisor console device <n>. This u
both Xen and PowerPC hypervisors.

If the device connected to the port is not a TTY u
device, prepend "brl," before the device type, for u
console=brl,ttyS0
For now, only VisioBraille is supported.

console_msg_format=
    [KNL] Change console messages format
    default
        By default we print messages on consoles in
        "[time stamp] text\n" format (time stamp u
printed, depending on CONFIG_PRINTK_TIME or
`printk_time' param).
    syslog
        Switch to syslog format: "<%u>[time stamp]u
IOW, each message will have a facility and u
prefix. The format is similar to one used u
syscall, or to executing "dmesg -S --raw"u
from /proc/kmsg.

```

```

consoleblank= [KNL] The console blank (screen saver)
↳timeout in
          seconds. A value of 0 disables the blank
↳timer.
          Defaults to 0.

coredump_filter=
          [KNL] Change the default value for
          /proc/<pid>/coredump_filter.
          See also Documentation/filesystems/proc.rst.

coresight_cpu_debug.enable
          [ARM,ARM64]
          Format: <bool>
          Enable/disable the CPU sampling based
↳debugging.
          0: default value, disable debugging
          1: enable debugging at boot time

cpuidle.off=1 [CPU_IDLE]
          disable the cpuidle sub-system

cpuidle.governor=
          [CPU_IDLE] Name of the cpuidle governor to
↳use.

cpufreq.off=1 [CPU_FREQ]
          disable the cpufreq sub-system

cpufreq.default_governor=
          [CPU_FREQ] Name of the default cpufreq
↳governor or
          policy to use. This governor must be
↳registered in the
          kernel before the cpufreq driver probes.

cpu_init_udelay=N
          [X86] Delay for N microsec between assert
↳and de-assert
          of APIC INIT to start processors. This
↳delay occurs
          on every CPU online, such as boot, and
↳resume from suspend.
          Default: 10000

cpcihp_generic= [HW,PCI] Generic port I/O CompactPCI driver
          Format:
          <first_slot>,<last_slot>,<port>,<enum_bit>[, ,
          <debug>]

crashkernel=size[KMG] [@offset[KMG]]

```

↳ 'crash kernel'  
↳ physical  
↳ that kernel  
↳ suitable offset  
↳ first, and  
↳ '@offset'  
↳ for further details.

[KNL] Using kexec, Linux can switch to a  
upon panic. This parameter reserves the  
memory region [offset, offset + size] for  
image. If '@offset' is omitted, then a  
is selected automatically.  
[KNL, X86-64] Select a region under 4G  
fall back to reserve region above 4G when  
hasn't been specified.  
See Documentation/admin-guide/kdump/kdump.rst

crashkernel=rangel:size1[,range2:size2,...][@offset]  
↳ memory  
↳ is  
↳ for an example.

[KNL] Same as above, but depends on the  
in the running system. The syntax of range  
start-[end] where start and end are both  
a memory unit (amount[KMG]). See also  
Documentation/admin-guide/kdump/kdump.rst

crashkernel=size[KMG],high  
↳ Allow kernel  
↳ so could  
↳ installed.  
↳ below 4G, if  
↳ specified.  
crashkernel=size[KMG],low  
↳ crashkernel=X,high  
↳ memory region  
↳ system  
↳ swiotlb  
↳ enough extra

[KNL, X86-64] range could be above 4G.  
to allocate physical memory region from top,  
be above 4G if system have more than 4G ram.  
Otherwise memory region will be allocated  
available.  
It will be ignored if crashkernel=X is  
is passed, kernel could allocate physical  
above 4G, that cause second kernel crash on  
that require some amount of low memory, e.g.  
requires at least 64M+32K low memory, also  
low memory is needed to make sure DMA

→ buffers for 32-bit devices won't run out. Kernel would try to ↳ allocate at least 256M below 4G automatically. This one let user to specify own low range ↳ under 4G for second kernel instead.  
0: to disable low allocation. It will be ignored when crashkernel=X,high ↳ is not used or memory reserved is below 4G.

**cryptomgr.notests** [KNL] Disable crypto self-tests

**cs89x0\_dma=** [HW,NET]  
Format: <dma>

**cs89x0\_media=** [HW,NET]  
Format: { rj45 | aui | bnc }

**dasd=** [HW,NET]  
See header of drivers/s390/block/dasd\_

→ devmap.c.

**db9.dev[2|3]=** [HW,JOY] Multisystem joystick support via ↳ parallel port (one device per port)  
Format: <port#>,<type>  
See also Documentation/input/devices/

→ joystick-parport.rst

**ddebug\_query=** [KNL,DYNAMIC\_DEBUG] Enable debug messages ↳ at early boot time. See Documentation/admin-guide/

→ dynamic-debug-howto.rst for details. Deprecated, see dyndbg.

**debug** [KNL] Enable kernel debugging (events log ↳ level).

**debug\_boot\_weak\_hash** [KNL] Enable printing [hashed] pointers ↳ early in the boot sequence. If enabled, we use a weak ↳ hash instead of siphash to hash pointers. Use this ↳ option if you are seeing instances of '(\_\_ptrval\_\_)' and ↳ need to see a

↳Cryptographically value (hashed pointer) instead.  
↳kernels. insecure, please do not use on production

↳locking API debug\_locks\_verbose= [KNL] verbose self-tests Format=<0|1> Print debugging info while doing the self-tests. We default to 0 (no extra messages), 1 will print \_a lot\_ more information - only useful to kernel developers.

↳setting it to debug\_objects [KNL] Enable object debugging  
↳normally no\_debug\_objects [KNL] Disable object debugging

↳this debug\_guardpage\_minorder= [KNL] When CONFIG\_DEBUG\_PAGEALLOC is set, parameter allows control of the order of pages that will be intentionally kept free (and hence protected) by the buddy allocator. Bigger value increase the probability of catching random memory corruption, but reduce the amount of memory for normal system use. The maximum possible value is MAX\_ORDER/2. Setting to 1 or 2 should be enough to identify most memory corruption problems caused by bugs driver code when a CPU writes to (or reads from) a random memory location. Note that there exists a class of memory corruptions problems caused by buggy H/W or F/W or by drivers badly programming DMA (basically when memory is written at bus level and the CPU MMU is

↵will not help bypassed) which are not detectable by CONFIG\_DEBUG\_PAGEALLOC, hence this option, tracking down these problems.

↵this parameter debug\_pagealloc= [KNL] When CONFIG\_DEBUG\_PAGEALLOC is set, enables the feature at boot time. By disabled and the system will work mostly kernel built without CONFIG\_DEBUG\_PAGEALLOC. Note: to get most of debug\_pagealloc error useful to also enable the page\_owner on: enable the feature

↵reports, it's functionality. [KNL] This parameter enables what is and debugfs internal clients. Format: { on, no-mount, off } on: All functions are enabled. no-mount: Filesystem is not registered but access APIs and a crashkernel can its content. There is nothing to off: Filesystem is not registered and get a -EPERM as result when trying or directories within debugfs. This is equivalent of the runtime debugfs was not enabled in the Default value is set in build-time with a

↵exposed to userspace ↵kernel clients can be used to read mount. clients to register files functionality if kernel at all. ↵kernel configuration. [X86] Enable PAT debugging

↵This is default\_hugepagesz= [HW] The size of the default HugeTLB page. This is the size represented by the legacy /proc/ APIs. In addition, this is the default

↵hugepages

```
↳ hugetlb size
    used for shmget(), mmap() and mounting
↳ hugetlbfs
    filesystems. If not specified, defaults to
↳ the
    architecture's default huge page size.
↳ Huge page
    sizes are architecture dependent. See also
    Documentation/admin-guide/mm/hugetlbpage.
↳ rst.

Format: size[KMG]

deferred_probe_timeout=
    [KNL] Debugging option to set a timeout in
seconds for
    deferred probe to give up waiting on
dependencies to
    probe. Only specific dependencies
(subsystems or
    drivers) that have opted in will be ignored.
A timeout of 0
will timeout at the end of initcalls. This
option will also
dump out devices still on the deferred
probe list after
retrying.

dfltcc=
    [HW,S390]
Format: { on | off | def_only | inf_only | ...
always }
    on:      s390 zlib hardware support for
compression on
    level 1 and decompression
(default)
    off:      No s390 zlib hardware support
def_only: s390 zlib hardware support for
    only (compression on level 1)
deflate
    inf_only: s390 zlib hardware support for
    only (decompression)
inflate
    always: Same as 'on' but ignores the
selected compression
    level always using hardware
support (used for debugging)

dhash_entries= [KNL]
    Set number of hash buckets for dentry cache.

disable_1tb_segments [PPC]
    Disables the use of 1TB hash page table
```

→segments. This causes the kernel to fall back to 256MB.  
 →segments which can be useful when debugging issues that  
 →require an SLB miss to occur.

stress\_slb [PPC]  
 →and flushes Limits the number of kernel SLB entries,  
 →faults them frequently to increase the rate of SLB  
 on kernel addresses.

disable= [IPV6]  
 See Documentation/networking/ipv6.rst.

hardened\_usercopy= [KNL] Under CONFIG\_HARDENED\_USERCOPY,  
 →whether hardening is enabled for this boot. Hardened usercopy checking is used to protect the  
 →kernel from reading or writing beyond known memory allocation boundaries as a proactive defense against bounds-checking flaws in the  
 →kernel's copy\_to\_user()/copy\_from\_user() interface.  
 →on Perform hardened usercopy checks (default).  
 →off Disable hardened usercopy checks.

disable\_radix [PPC]  
 Disable RADIX MMU mode on POWER9

radix\_hcall\_invalidate=on [PPC/PSERIES]  
 →for TLB Disable RADIX GTSE feature and use hcall  
 →invalidate.

disable\_tlbie [PPC]  
 →not work Disable TLBIE instruction. Currently does  
 →accelerators. with KVM, with HASH MMU, or with coherent

disable\_cpu\_apicid= [X86,APIC,SMP]  
 Format: <int>  
 The number of initial APIC ID for the corresponding CPU to be disabled at boot, mostly used for the kdump 2nd kernel to disable BSP to wake up multiple CPUs without

causing system reset or hang due to sending INIT from AP to BSP.

`perf_v4_pmi=` [X86, INTEL]  
Format: <bool>  
Disable Intel PMU counter freezing feature.  
The feature only exists starting from Arch Perfmon v4 (Skylake and newer).

`disable_ddw` [PPC/PSERIES]  
Disable Dynamic DMA Window support. Use this to workaround buggy firmware.

`disable_ipv6=` [IPV6]  
See Documentation/networking/ipv6.rst.

`disable_mtrr_cleanup` [X86]  
The kernel tries to adjust MTRR layout from continuous to discrete, to make X server driver able to add WB entry later. This parameter disables that.

`disable_mtrr_trim` [X86, Intel and AMD only]  
By default the kernel will trim any uncacheable memory out of your available memory pool based on MTRR settings. This parameter disables that behavior, possibly causing your machine to run very slowly.

`disable_timer_pin_1` [X86]  
Disable PIN 1 of APIC timer  
Can be useful to work around chipset bugs.

`dis_ucode_ldr` [X86] Disable the microcode loader.

`dma_debug=off` If the kernel is compiled with DMA\_API\_DEBUG support, this option disables the debugging code at boot.

`dma_debug_entries=<number>`  
This option allows to tune the number of preallocated entries for DMA-API debugging code. One entry is required per DMA-API allocation. Use this if the

DMA-API debugging code disables itself because the architectural default is too low.

`dma_debug_driver=<driver_name>`  
 With this option the DMA-API debugging filter feature can be enabled at boot time.  
 Just pass the driver to filter for as the parameter. The filter can be disabled or changed to another driver later using sysfs.

`reg_file_data_sampling=`  
 [X86] Controls mitigation for Register File Sampling (RFDS) vulnerability. RFDS is a CPU vulnerability which may allow userspace to infer kernel data values previously stored in registers, vector registers, or integer registers. RFDS only affects Intel Atom processors.

on: Turns ON the mitigation.  
 off: Turns OFF the mitigation.

This parameter overrides the compile time by CONFIG\_MITIGATION\_RFDS. Mitigation disabled when other VERW based mitigations are enabled. In order to disable RFDS VERW based mitigations need to be disabled.

For details see:  
<Documentation/admin-guide/hw-vuln/reg-file-data-sampling.rst>

`driver_async_probe= [KNL]`  
 List of driver names to be probed  
 asynchronously.  
 Format: <driver\_name1>,<driver\_name2>...

`drm.edid_firmware=[<connector>:]<file>[, [<connector>:]<file>]`

Broken monitors, graphic adapters, KVMs and panels may send no or incorrect EDID data. This parameter allows to specify an EDID in the /lib/firmware directory that are Generic built-in EDID data sets are used, edid/1024x768.bin, edid/1280x1024.bin, edid/1680x1050.bin, or edid/1920x1080.bin and no file with the same name exists. Instructions how to build your own EDID available in Documentation/admin-guide/edid. data set will only be used for a particular if its name and a colon are prepended to name. Each connector may use a unique EDID set by separating the files with a comma. data set with no connector name will be any connectors not explicitly specified.

`dscc4.setup= [NET]`

`dt_cpu_ftrs= [PPC]`  
Format: {"off" | "known"}  
Control how the dt\_cpu\_ftrs device-tree used for CPU feature discovery and setup exists).  
off: Do not use it, fall back to legacy cpu known: Do not pass through unknown features or userspace, only those that the kernel is aware of.

`dump_apple_properties [X86]`  
Dump name and content of EFI device x86 Macs. Useful for driver authors to

properties on

→determine what data is available or for  
 →reverse-engineering.

dyndbg[="val"] [KNL,DYNAMIC\_DEBUG]  
 <module>.dyndbg[="val"]  
 Enable debug messages at boot time. See Documentation/admin-guide/  
 ↪dynamic-debug-howto.rst  
 for details.

nopku [X86] Disable Memory Protection Keys CPU  
 ↪feature found in some Intel CPUs.

<module>.async\_probe [KNL]  
 Enable asynchronous probe on this module.

early\_ioremap\_debug [KNL]  
 Enable debug messages in early\_ioremap.  
 ↪support. This is useful for tracking down temporary early  
 ↪mappings which are not unmapped.

earlycon= [KNL] Output early console device and  
 ↪options.  
 When used with no options, the early  
 ↪console is determined by stdout-path property in  
 ↪device tree's chosen node or the ACPI SPCR table if  
 ↪supported by the platform.

cdns,<addr>[,options]  
 Start an early, polled-mode console on a  
 ↪Cadence (xuartps) serial port at the specified  
 ↪address. Only supported option is baud rate. If baud rate  
 ↪is not specified, the serial port must already be  
 ↪setup and configured.

uart[8250],io,<addr>[,options]  
 uart[8250],mmio,<addr>[,options]  
 uart[8250],mmio32,<addr>[,options]  
 uart[8250],mmio32be,<addr>[,options]

```
uart[8250],0x<addr>[,options]
    Start an early, polled-mode console on the u
→8250/16550
    UART at the specified I/O port or MMIO u
→address.
    MMIO inter-register address stride is u
→either 8-bit
    (mmio) or 32-bit (mmio32 or mmio32be).
→ is assumed
    If none of [io|mmio|mmio32|mmio32be], <addr>
→specified
    to be equivalent to 'mmio'. 'options' are u
    in the same format described for u
→"console=ttyS<n>"; if
    unspecified, the h/w is not initialized.

pl011,<addr>
pl011,mmio32,<addr>
    Start an early, polled-mode console on a u
→pl011 serial
    port at the specified address. The pl011 u
→serial port
    must already be setup and configured. u
→Options are not
    yet supported. If 'mmio32' is specified, u
→then only
    the driver will use only 32-bit accessors u
→to read/write
    the device registers.

meson,<addr>
    Start an early, polled-mode console on a u
→meson serial
    port at the specified address. The serial u
→port must
    already be setup and configured. Options u
→are not yet
    supported.

msm_serial,<addr>
    Start an early, polled-mode console on an u
→msm serial
    port at the specified address. The serial u
→port
    must already be setup and configured. u
→Options are not
    yet supported.

msm_serial_dm,<addr>
    Start an early, polled-mode console on an u
→msm serial
```

↪ serial port	dm port at the specified address. The must already be setup and configured.

 earlyprintk=sclp  
 earlyprintk=xen  
 earlyprintk=serial[,ttySn[,baudrate]]  
 earlyprintk=serial[,0x...[,baudrate]]  
 earlyprintk=ttySn[,baudrate]  
 earlyprintk=dbgp[debugController#]  
 earlyprintk=pciserial[,force],bus:device.  
 earlyprintk=xdbc[xhciController#]

earlyprintk is useful when the kernel takes over the normal console is initialized. It is default because it has some cosmetic.

Append ",keep" to not disable it when the takes over.

Only one of vga, efi, serial, or usb debug can be used at a time.

Currently only ttyS0 and ttyS1 may be name. Other I/O ports may be explicitly on some architectures (x86 and arm at replacing ttySn with an I/O port address,

```
earlyprintk=serial,0x1008,115200
You can find the port for a given device in /proc/tty/driver/serial:
  2: uart:ST16650V2 port:00001008
```

↳irq:18 ...

Interaction with the standard serial driver is not very good.

↳overwritten by

The VGA and EFI output is eventually overwritten by the real console.

↳guests.

The xen output can only be used by Xen PV guests.

↳use of a  
↳of the

The sclp output can only be used on s390.

The optional "force" to "pciserial" enables PCI device even when its classcode is not UART class.

↳overridden  
↳module.  
↳EDAC.  
↳W event.

edac\_report= [HW,EDAC] Control how to report EDAC event Format: {"on" | "off" | "force"} on: enable EDAC to report H/W event. May be overridden by other higher priority error reporting off: disable H/W event reporting through force: enforce the use of EDAC to report H/ default: on.

↳debugging

ekgdboc= [X86,KGDB] Allow early kernel console ekgdboc=kbd

↳with

This is designed to be used in conjunction with the boot argument: earlyprintk=vga

↳parameter  
↳available  
↳debugging  
↳instead.

This parameter works in place of the kgdboc but can only be used if the backing tty is very early in the boot process. For early via a serial port see kgdboc\_earlycon

edd=

[EDD]

```

Format: {"off" | "on" | "skip[mbr]"}
efi= [EFI]
Format: { "debug", "disable_early_pci_dma",
           "nochunk", "noruntime", "novamap", "no_disable_early_pci_
debug: enable misc debug output.
disable_early_pci_dma: disable the
PCI bridges while in the EFI boot stub.
nochunk: disable reading files in "chunks"
boot stub, as chunking can cause problems
firmware implementations.
noruntime : disable EFI runtime services
nosoftreserve: The EFI_MEMORY_SP (Specific
attribute may cause the kernel to reserve
memory range for a memory mapping driver to
claim. Specify efi=nosoftreserve to disable
reservation and treat the memory by its
(i.e. EFI_CONVENTIONAL_MEMORY / "System"
novamap: do not call SetVirtualAddressMap().
no_disable_early_pci_dma: Leave the
on all PCI bridges while in the EFI boot
busmaster bit set
busmaster bit set
stub
efi_no_storage_paranoia [EFI; X86]
Using this parameter you can use more than
50% of
your efi variable storage. Use this
parameter only if
you are really sure that your UEFI does
sane gc and
fulfills the spec otherwise your board may
brick.

efi_fake_mem= nn[KMG]@ss[KMG]:aa[,nn[KMG]@ss[KMG]:aa,...]
[EFI; X86]
Add arbitrary attribute to specific memory
range by
updating original EFI memory map.

```

Region of memory which aa attribute is added to is from ss to ss+nn.

If efi\_fake\_mem=2G@4G:0x10000, 2G@0x10a0000000:0x10000 is specified, EFI\_MEMORY\_MORE\_RELIABLE(0x10000) attribute is added to range 0x100000000-0x180000000 and 0x10a0000000-0x1120000000.

If efi\_fake\_mem=8G@9G:0x40000 is specified, the EFI\_MEMORY\_SP(0x40000) attribute is added to range 0x240000000-0x43fffff.

Using this parameter you can do debugging related features. For example, you can do Address Range Mirroring feature even if doesn't support it, or mark specific memory "soft reserved".

efivar\_ssdt=[EFI; X86] Name of an EFI variable that contains an SSDT. If there are multiple variables with the same name but vendor GUIDs, all of them will be loaded. See Documentation/admin-guide/acpi/ssdt-overlays.rst for details.

eisa\_irq\_edge=[PARISC,HW] See header of drivers/parisc/eisa.c.

elanfreq=[X86-32] See comment before function elanfreq\_ setup() in arch/x86/kernel/cpu/cpufreq/elanfreq.c.

elfcorehdr=[size[KMG]@]offset[KMG] [IA64, PPC, SH, X86, S390] Specifies physical address of start of kernel core image elf header and optionally the size.

↳ Generally	kexec loader will pass this option to
↳ capture kernel.	See Documentation/admin-guide/kdump/kdump.
↳ rst for details.	
enable_mtrr_cleanup [X86]	The kernel tries to adjust MTRR layout from
↳ continuous	to discrete, to make X server driver able
↳ to add WB	entry later. This parameter enables that.
enable_timer_pin_1 [X86]	Enable PIN 1 of APIC timer
	Can be useful to work around chipset bugs
	(in particular on some ATI chipsets).
	The kernel tries to set a reasonable
↳ default.	
enforcing	[SELINUX] Set initial enforcing status. Format: {"0"   "1"} See security/selinux/Kconfig help text. 0 -- permissive (log only, no denials). 1 -- enforcing (deny and log). Default value is 0. Value can be changed at runtime via /sys/fs/selinux/enforce.
erst_disable	[ACPI] Disable Error Record Serialization Table
↳ (ERST)	
	support.
ether=	[HW,NET] Ethernet cards parameters This option is obsoleted by the "netdev="
↳ option, which	
↳ for details.	has equivalent usage. See its documentation
evm=	[EVM] Format: { "fix" } Permit 'security.evm' to be updated
↳ regardless of	
	current integrity status.
failslab=	
fail_usercopy=	
fail_page_alloc=	
fail_make_request=[KNL]	General fault injection mechanism.

Format: <interval>,<probability>,<space>,   
↪<times>  
See also Documentation/fault-injection/.

fb\_tunnels= [NET]  
Format: { initns | none }  
See Documentation/admin-guide/sysctl/net.

↪rst for  
fb\_tunnels\_only\_for\_init\_ns

floppy= [HW]  
See Documentation/admin-guide/blockdev/

↪floppy.rst.

force\_pal\_cache\_flush [IA-64] Avoid check\_sal\_cache\_flush which ↪  
↪may hang on buggy SAL\_CACHE\_FLUSH implementations.  
↪Using this parameter will force ia64\_sal\_cache\_flush ↪  
↪to call ia64\_pal\_cache\_flush instead of SAL\_CACHE\_ ↪  
↪FLUSH.

forcepae [X86-32]  
Forcefully enable Physical Address ↪  
↪Extension (PAE). Many Pentium M systems disable PAE but may ↪  
↪have a functionally usable PAE implementation.  
↪the kernel Warning: use of this parameter will taint ↪  
↪and may cause unknown problems.

ftrace=[tracer] [FTRACE] will set and start the specified ↪  
↪tracer as early as possible in order to facilitate ↪  
↪early boot debugging.

ftrace\_dump\_on\_oops[=orig\_cpu] [FTRACE] will dump the trace buffers on ↪  
↪oops. If no parameter is passed, ftrace will dump buffers of all CPUs, but if you pass orig\_ ↪  
↪cpu, it will dump only the buffer of the CPU that ↪  
↪triggered the oops.

```

ftrace_filter=[function-list]
    [FTRACE] Limit the functions traced by the tracer at boot up. function-list is a comma separated list of functions. This list can be changed at run time by the set_ftrace_filter file in the debugfs tracing directory.

ftrace_notrace=[function-list]
    [FTRACE] Do not trace the functions specified in function-list. This list can be changed at run time by the set_ftrace_notrace file in the debugfs tracing directory.

ftrace_graph_filter=[function-list]
    [FTRACE] Limit the top level callers of functions traced by the function graph tracer at boot up. function-list is a comma separated list of functions that can be changed at run time by the set_graph_function file in the debugfs tracing directory.

ftrace_graph_notrace=[function-list]
    [FTRACE] Do not trace from the functions specified in a separated list of functions by the set_graph_notrace file in the debugfs tracing directory.

ftrace_graph_max_depth=<uint>
    [FTRACE] Used with the function graph tracer. This is the max depth it will trace into a function. This value can be changed at run time by the max_graph_depth file in the tracefs tracing directory. default: 0 (no limit)

fw_devlink=      [KNL] Create device links between consumer

```

→ and supplier devices by scanning the firmware to infer consumer/supplier relationships. This is especially useful when drivers are loaded; it ensures proper ordering of tasks like (suppliers first, then consumers), supplier clean up (only after all consumers have suspended/resumed & runtime PM (consumers suppliers).  
Format: { off | permissive | on | rpm }  
off -- Don't create device links from permissive -- Create device links from but use it only for ordering boot up (sync\_state() calls).  
on -- Create device links from firmware to enforce probe and suspend/resume.  
rpm -- Like "on", but also use to order.

→ runtime PM.

gamecon.map[2|3]=[HW,JOY] Multisystem joystick and NES/SNES/PSX pad support via parallel port (up to 5 devices)  
per port) Format: <port#>,<pad1>,<pad2>,<pad3>,<pad4>, <pad5>  
See also Documentation/input/devices/ → joystick-parport.rst

corresponding firmware-first mode error.  
 ↵processing logic will be disabled.

highmem=nn[KMG] [KNL,B00T] forces the highmem zone to have  
 ↵an exact size of <nn>. This works even on boxes that  
 ↵have no highmem otherwise. This also works to  
 ↵reduce highmem size on bigger boxes.

highres=  
 ↵mode. [KNL] Enable/disable high resolution timer.  
 Valid parameters: "on", "off"  
 Default: "on"

hlt [BUGS=ARM,SH]

hpet=  
 ↵force | [X86-32,HPET] option to control HPET usage  
 ↵chips (ICH4,  
 ↵during setup  
 ↵HPET  
 ↵DEFAULT.  
 ↵allocation [HW] The size of a cma area used for  
 ↵allocate gigantic of gigantic hugepages.  
 ↵enabled, the Format: nn[KMGTPE]  
 ↵is skipped.  
 Reserve a cma area of given size and  
 hugepages using the cma allocator. If  
 boot-time allocation of gigantic hugepages

hugepages=  
 ↵boot. [HW] Number of HugeTLB pages to allocate at  
 ↵specifies If this follows hugepagesz (below), it

the number of pages of hugepagesz to be allocated.  
If this is the first HugeTLB parameter on line, it specifies the number of pages to allocate for the default huge page size. See also Documentation/admin-guide/mm/hugetlbpage.

Format: <integer>

hugepagesz=  
is used in conjunction with hugepages (above) to allocate huge pages of a specific size at boot. The pair hugepagesz=X hugepages=Y can be specified for each supported huge page size. Huge page architecture dependent. See also Documentation/admin-guide/mm/hugetlbpage.

Format: size[KMG]

hung\_task\_panic=  
generate panics. Format: 0 | 1  
A value of 1 instructs the kernel to panic when a hung task is detected. The default value is selected by the CONFIG\_BOOTPARAM\_HUNG\_TASK\_PANIC option. The value selected by this boot parameter can be changed later by the kernel.hung\_task\_.  
when a controlled build-time parameter can panic sysctl.

hvc\_iucv= [S390] Number of z/VM IUCV hypervisor console (HVC) terminal devices. Valid values: 0..8  
hvc\_iucv\_allow= [S390] Comma-separated list of z/VM user IDs. If specified, z/VM IUCV HVC accepts connections from listed z/VM user IDs only.

hv\_nopvspin [X86,HYPER\_V] Disables the paravirt spinlock optimizations which allow the hypervisor to 'idle' the guest on lock contention.

keep\_bootcon [KNL]  
 Do not unregister boot console at start.  
 This is only useful for debugging when something happens between unregistering the boot console and the real console.  
 in the window initializing

i2c\_bus= [HW] Override the default board specific or register an additional I2C bus registered from board  
 I2C bus speed that is not initialization code.

Format:  
 <bus\_id>, <clkrate>

i8042.debug [HW] Toggle i8042 debug mode  
 i8042.unmask\_kbd\_data [HW] Enable printing of interrupt data from the KBD port (disabled by default, and as a pre-condition requires that i8042.debug=1 be enabled)

i8042.direct [HW] Put keyboard port into non-translated mode  
 i8042.dumbkbd [HW] Pretend that controller can only read data from keyboard and cannot control its state (Don't attempt to blink the leds)

i8042.noaux [HW] Don't check for auxiliary (== mouse) port  
 i8042.nokbd [HW] Don't check/create keyboard port  
 i8042.noloop [HW] Disable the AUX Loopback command while probing for the AUX port

i8042.nomux [HW] Don't check presence of an active multiplexing controller

i8042.nopnp [HW] Don't use ACPIPnP / PnPBIOS to discover KBD/AUX controllers

i8042.notimeout [HW] Ignore timeout condition signalled by controller

```
i8042.reset      [HW] Reset the controller during init, u
↳ cleanup and               suspend-to-ram transitions, only u
↳ during s2r               transitions, or never reset

                             1, Y, y: always reset controller
                             0, N, n: don't ever reset controller
                             Default: only on s2r transitions on x86; u
↳ most other             architectures force reset to be always u
↳ executed
    i8042.unlock      [HW] Unlock (ignore) the keylock
    i8042.kbdreset    [HW] Reset device connected to KBD port
    i8042.probe_defer [HW] Allow deferred probing upon i8042; u
↳ probe errors

    i810=            [HW,DRM]

    i8k.ignore_dmi   [HW] Continue probing hardware even if DMI u
↳ data           indicates that the driver is running on u
↳ unsupported
    i8k.force        [HW] Activate i8k driver even if SMM BIOS; u
↳ signature
    i8k.power_status [HW] Report power status in /proc/i8k
                      (disabled by default)
    i8k.restricted   [HW] Allow controlling fans only if SYS_
↳ ADMIN          capability is set.

    i915.invert_brightness=
                      [DRM] Invert the sense of the variable that u
↳ is used to       set the brightness of the panel backlight. u
↳ Normally a       brightness value of 0 indicates backlight u
↳ switched off,    and the maximum of the brightness value u
↳ sets the backlight to maximum brightness. If this parameter is u
↳ set to 0         (default) and the machine requires it, or u
↳ this parameter   is set to 1, a brightness value of 0 sets u
↳ the backlight    to maximum brightness, and the maximum of u
```

→ the brightness  
 value switches the backlight off.  
 -1 -- never invert brightness  
 0 -- machine default  
 1 -- force brightness inversion

icn= [HW,ISDN]  
 Format: <io>[,<membase>[,<icn\_id>[,<icn\_id2>  
 ↵]]]

ide-core.nodma= [HW] (E)IDE subsystem  
 Format: =0.0 to prevent dma on hda, =0.1  
 ↵hdb =1.0 hdc  
 .vlb\_clock .pci\_clock .noflush .nohpa .  
 ↵noprobe .nowerr  
 .cdrom .chs .ignore\_cable are additional  
 ↵options  
 See Documentation/ide/ide.rst.

ide-generic.probe-mask= [HW] (E)IDE subsystem  
 Format: <int>  
 Probe mask for legacy ISA IDE ports.  
 ↵Depending on  
 platform up to 6 ports are supported,  
 ↵enabled by  
 setting corresponding bits in the mask to 1.  
 ↵ The  
 default value is 0x0, which has a special  
 ↵meaning.  
 On systems that have PCI, it triggers  
 ↵scanning the  
 PCI bus for the first and the second port,  
 ↵which  
 are then probed. On systems without PCI  
 ↵the value  
 of 0x0 enables probing the two first ports  
 ↵as if it  
 was 0x3.

ide-pci-generic.all-generic-ide [HW] (E)IDE subsystem  
 Claim all unknown PCI IDE storage  
 ↵controllers.

idle= [X86]  
 Format: idle=poll, idle=halt, idle=nomwait  
 Poll forces a polling idle loop that can  
 ↵slightly  
 improve the performance of waking up a idle  
 ↵CPU, but  
 will use a lot of power and make the system  
 ↵run hot.

Not recommended.  
idle=halt: Halt is forced to be used for CPU idle.  
In such case C2/C3 won't be used again.  
idle=nomwait: Disable mwait for CPU C-states

ieee754=[MIPS] Select IEEE Std 754 conformance mode  
Format: { strict | legacy | 2008 | relaxed }  
Default: strict

Choose which programs will be accepted for execution based on the IEEE 754 NaN encoding(s) supported by the FPU and the NaN encoding requested with the ELF file header flag individually set of an ELF file header flag individually set binary. Hardware implementations are supported either or both of the legacy and encoding mode.

Available settings are as follows:  
strict accept binaries that request a NaN supported by the FPU  
legacy only accept legacy-NaN binaries, if supported by the FPU  
2008 only accept 2008-NaN binaries, if supported by the FPU  
relaxed accept any binaries regardless of supported by the FPU

The FPU emulator is always able to support encodings, so if no FPU hardware is present been disabled with 'nofpu', then the 'legacy' and '2008' strap the emulator 'relaxed' straps the emulator for both 2008-NaN, whereas 'strict' enables legacy processors and both NaN encodings on

→ MIPS32 or  
MIPS64 CPUs.

→ execution mode generally follows that for the NaN, except where unsupported by hardware.

ignore\_loglevel [KNL]  
Ignore loglevel setting - this will print /kernel messages to the console. Useful for debugging. We also add it as printk module parameter, so users could change it dynamically, usually by /sys/module/printk/parameters/ignore\_loglevel.

ignore\_rlimit\_data  
Ignore RLIMIT\_DATA setting for data mappings, print warning at first misuse. Can be changed via /sys/module/kernel/parameters/ignore\_rlimit\_data.

ihash\_entries= [KNL]  
Set number of hash buckets for inode cache.

ima\_appraise= [IMA] appraise integrity measurements  
Format: { "off" | "enforce" | "fix" | "log" }  
default: "enforce"

ima\_appraise\_tcb [IMA] Deprecated. Use ima\_policy= instead.  
The builtin appraise policy appraises all files owned by uid=0.

ima\_canonical\_fmt [IMA]  
Use the canonical format for the binary runtime measurements, instead of host native format.

ima\_hash= [IMA]  
Format: { md5 | sha1 | rmd160 | sha256 | sha384 | sha512 | ... }  
default: "sha1"

↳ defined	The list of supported hash algorithms is in crypto/hash_info.h.
↳ ima_policy= [IMA] ↳ setup.	The builtin policies to load during IMA Format: "tcb   appraise_tcb   secure_boot   fail_securely"
↳ exec'd, files ↳ the read ↳ (euid=0) or	The "tcb" policy measures all programs mmap'd for exec, and all files opened with mode bit set by either the effective uid or uid=0.
↳ integrity of	The "appraise_tcb" policy appraises the all files owned by root.
↳ integrity ↳ modules, ↳ signatures.	The "secure_boot" policy appraises the of files (eg. kexec kernel image, kernel firmware, policy, etc) based on file.
↳ signature ↳ mounted ↳ SIGNATURE	The "fail_securely" policy forces file verification failure also on privileged filesystems with the SB_I_UNVERIFIABLE_ flag.
↳ ima_tcb ↳ Trusted ↳ measure all ↳ all files	[IMA] Deprecated. Use ima_policy= instead. Load a policy which meets the needs of the Computing Base. This means IMA will programs exec'd, files mmap'd for exec, and opened for read by uid=0.
↳ ima_template= ↳ template formats.	[IMA] Select one of defined IMA measurements Formats: { "ima"   "ima-ng"   "ima-sig" }

```

Default: "ima-ng"

ima_template_fmt=
    [IMA] Define a custom template format.
    Format: { "field1|...|fieldN" }

    ima.ahash_minsize= [IMA] Minimum file size for asynchronous
    ↳ hash usage
        Format: <min_file_size>
        Set the minimal file size for using
    ↳ asynchronous hash.
        If left unspecified, ahash usage is
    ↳ disabled.

    ↳ sizes on
    ↳ can be used
    ↳ particular HW.
        ahash performance varies for different data
        different crypto accelerators. This option
        to achieve the best performance for a

ima.ahash_bufsize= [IMA] Asynchronous hash buffer size
    Format: <bufsize>
    Set hashing buffer size. Default: 4k.

    ↳ chunk sizes on
    ↳ can be used
    ↳ HW.
        ahash performance varies for different
        different crypto accelerators. This option
        to achieve best performance for particular

init=
    [KNL]
    Format: <full_path>
    Run specified binary instead of /sbin/init
    ↳ as init
        process.

    initcall_debug [KNL] Trace initcalls as they are executed.
    ↳ Useful
        for working out where the kernel is dying
    ↳ during
        startup.

    initcall_blacklist= [KNL] Do not execute a comma-separated
    ↳ list of
        initcall functions. Useful for debugging
    ↳ built-in
        modules and initcalls.

    initrd= [BOOT] Specify the location of the initial

```

↳ ramdisk

    initrdmem= [KNL] Specify a physical address and size  
↳ from which to load the initrd. If an initrd is compiled  
↳ in or specified in the bootparams, it takes  
↳ priority over this setting.  
    Format: ss[KMG],nn[KMG]  
    Default is 0, 0

    init\_on\_alloc= [MM] Fill newly allocated pages and heap  
↳ objects with zeroes.  
    Format: 0 | 1  
    Default set by CONFIG\_INIT\_ON\_ALLOC\_DEFAULT\_  
↳ ON.

    init\_on\_free= [MM] Fill freed pages and heap objects with  
↳ zeroes.  
    Format: 0 | 1  
    Default set by CONFIG\_INIT\_ON\_FREE\_DEFAULT\_  
↳ ON.

    init\_pkru= [X86] Specify the default memory protection  
↳ keys rights register contents for all processes.  
↳ 0x55555554 by default (disallow access to all but pkey 0).  
    Can override in debugfs after boot.

    inport.irq= [HW] Inport (ATI XL and Microsoft) busmouse  
↳ driver  
    Format: <irq>

    int\_pln\_enable [X86] Enable power limit notification  
↳ interrupt

    integrity\_audit=[IMA]  
        Format: { "0" | "1" }  
        0 -- basic integrity auditing messages.  
    ↳ (Default)  
        1 -- additional integrity auditing messages.

    intel\_iommu=  
        on [DMAR] Intel IOMMU driver (DMAR) option  
        Enable intel iommu driver.  
        off  
        Disable intel iommu driver.

**igfx\_off** [Default Off]  
 By default, gfx is mapped as normal device.  
 ↪ If a gfx  
 ↪ unit is  
 ↪ option. In  
 ↪ address for  
 ↪ DMA.  
**forcedac** [X86-64]  
 With this option iommu will not optimize to  
 ↪ look  
 ↪ dual  
 ↪ supporting greater  
 ↪ look  
 ↪ available  
 ↪ operation will  
 ↪ as opposed  
 ↪ Intel IOMMU

 ↪ high-throughput

**strict** [Default Off]  
 With this option on every unmap\_single  
 ↪ result in a hardware IOTLB flush operation  
 ↪ to batching them for performance.  
**sp\_off** [Default Off]  
 By default, super page will be supported if  
 ↪ has the capability. With this option, super  
 ↪ not be supported.  
**sm\_on** [Default Off]  
 By default, scalable mode will be disabled  
 ↪ hardware advertises that it has support for  
 ↪ mode translation. With this option set,  
 ↪ will be used on hardware which claims to  
**tboot\_noforce** [Default Off]  
 Do not force the Intel IOMMU enabled under  
 ↪ By default, tboot will force Intel IOMMU on,  
 ↪ could harm performance of some  
 ↪ devices like 40Gbit network cards, even if

↳ identity  
mapping is enabled.  
Note that using this option lowers the security provided by tboot because it makes the system vulnerable to DMA attacks.

↳ such as nobounce [Default off]  
Disable bounce buffer for untrusted devices, the Thunderbolt devices. This will treat the untrusted devices as the trusted ones, hence might expose security risks of DMA attacks.

intel\_idle.max\_cstate= [KNL,HW,ACPI,X86]  
0 disables intel\_idle and fall back on acpi\_idle.  
1 to 9 specify maximum depth of C-state.

intel\_pstate= [X86]  
disable  
Do not enable intel\_pstate as the default scaling driver for the supported processors.

processors  
configure it  
(instead of mode cannot be used along with the hardware-managed P-states (HWP) feature.)  
prohibit it by default in favor of acpi-cpufreq. Forcing the intel\_pstate driver instead of acpi-cpufreq may disable platform features, such as thermal controls and power capping, that rely on ACPI OSPM and therefore should be used with caution. This option does not work with processors that aren't supported by the intel\_pstate driver.

or on platforms that use pcc-cpufreq, instead of acpi-cpufreq.

- no\_hwp  
Do not enable hardware P state control, if available.
- (HWP)  
hwp\_only  
Only load intel\_pstate on systems which support hardware P state control (HWP) if available.
- support\_acpi\_ppc  
Enforce ACPI \_PPC performance limits. If Description Table, specifies preferred profile as "Enterprise Server" or, then this feature is turned on by default.
- per\_cpu\_perf\_limits  
Allow per-logical-CPU P-State performance control limits using cpufreq sysfs interface
- intremap=[X86-64, Intel-IOMMU]  
on enable Interrupt Remapping (default)  
off disable Interrupt Remapping  
nosid disable Source ID checking  
no\_x2apic\_optout  
BIOS x2APIC opt-out request will be ignored  
nopost disable Interrupt Posting
- iomem=Disable strict checking of access to MMIO, memory  
strict regions from userspace.  
relaxed
- iommu=[X86]  
off

↳ System V IPC identifiers from 32,768 to 16,777,216.

irqaffinity= [SMP] Set the default irq affinity mask  
 The argument is a cpu list, as described ↴ above.

irqchip.gicv2\_force\_probe= [ARM, ARM64]  
 Format: <bool>  
 Force the kernel to look for the second 4kB ↴ page  
 of a GICv2 controller even if the memory ↴ range  
 exposed by the device tree is too small.

irqchip.gicv3\_nolpi= [ARM, ARM64]  
 Force the kernel to ignore the availability ↴ of  
 LPIs (and by consequence ITSs). Intended ↴ for system  
 that use the kernel as a bootloader, and ↴ thus want  
 to let secondary kernels in charge of ↴ setting up  
 LPIs.

irqchip.gicv3\_pseudo\_nmi= [ARM64]  
 Enables support for pseudo-NMIs in the ↴ kernel. This  
 requires the kernel to be built with  
 CONFIG\_ARM64\_PSEUDO\_NMI.

irqfixup [HW]  
 When an interrupt is not handled search all ↴ handlers  
 for it. Intended to get systems with badly ↴ broken  
 firmware running.

irqpoll [HW]  
 When an interrupt is not handled search all ↴ handlers  
 for it. Also check all handlers each timer  
 interrupt. Intended to get systems with ↴ badly broken  
 firmware running.

isapnp= [ISAPNP]  
 Format: <RDP>,<reset>,<pci\_scan>,<verbosity>

isolcpus= [KNL,SMP,ISOL] Isolate a given set of CPUs ↴

↳ from disturbance.  
[Deprecated - use cpusets instead]  
Format: [flag-list,]<cpu-list>

Specify one or more CPUs to isolate from  
disturbances  
specified in the flag list (default:  
↳ domain):

nohz  
Disable the tick when a single task runs.

↳ workqueues, which you  
the global  
sysfs file, or  
below.

A residual 1Hz tick is offloaded to  
need to affine to housekeeping through  
workqueue's affinity configured via the  
/sys/devices/virtual/workqueue/cpumask  
by using the 'domain' flag described  
NOTE: by default the global workqueue  
so to protect individual CPUs the  
be configured manually after bootup.

domain  
Isolate from the general SMP balancing  
algorithms. Note that performing domain  
is irreversible: it's not possible to  
the domains once isolated through  
advised to use cpusets instead to disable  
balancing through the "cpuset.sched\_load\_  
It offers a much more flexible interface  
move in and out of an isolated set  
You can move a process onto or off an  
"isolated" CPU via  
value is

"number of CPUs in system - 1".

`managed_irq`

Isolate from being targeted by managed   
which have an interrupt mask containing   
CPUs. The affinity of managed interrupts   
handled by the kernel and cannot be   
the /proc/irq/\* interfaces.

This isolation is best effort and only   
if the automatically assigned interrupt   
device queue contains isolated and   
CPUs. If housekeeping CPUs are online   
interrupts are directed to the   
so that IO submitted on the housekeeping   
cannot disturb the isolated CPU.

If a queue's affinity mask contains only   
CPUs then this parameter has no effect on   
interrupt routing decision, though   
only delivered when tasks running on those  
isolated CPUs submit IO. IO submitted on  
housekeeping CPUs has no influence on   
queues.

The format of <cpu-list> is described above.

<code>iucv=</code>	[HW,NET]
<code>ivrs_ioapic</code>	[HW,X86-64] Provide an override to the IOAPIC-ID<-> mapping provided in the IVRS ACPI table. By default, PCI segment is 0, and can be <u> </u> omitted.

For example, to map IOAPIC-ID decimal 10 to PCI segment 0x1 and PCI device 00:14.0, write the parameter as:

```
ivrs_ioapic=10@0001:00:14.0
```

Deprecated formats:

\* To map IOAPIC-ID decimal 10 to PCI device ↴

↳ 00:14.0

write the parameter as:

```
ivrs_ioapic[10]=00:14.0
```

\* To map IOAPIC-ID decimal 10 to PCI ↴

↳ segment 0x1 and

PCI device 00:14.0 write the parameter as:

```
ivrs_ioapic[10]=0001:00:14.0
```

ivrs\_hpet [HW,X86-64]

Provide an override to the HPET-ID<->

↳ DEVICE-ID

mapping provided in the IVRS ACPI table.

By default, PCI segment is 0, and can be ↴

↳ omitted.

For example, to map HPET-ID decimal 10 to PCI segment 0x1 and PCI device 00:14.0, write the parameter as:

```
ivrs_hpet=10@0001:00:14.0
```

Deprecated formats:

\* To map HPET-ID decimal 0 to PCI device ↴

↳ 00:14.0

write the parameter as:

```
ivrs_hpet[0]=00:14.0
```

\* To map HPET-ID decimal 10 to PCI segment ↴

↳ 0x1 and

PCI device 00:14.0 write the parameter as:

```
ivrs_ioapic[10]=0001:00:14.0
```

ivrs\_acpihid [HW,X86-64]

Provide an override to the ACPI-HID:UID<->

↳ DEVICE-ID

mapping provided in the IVRS ACPI table.

By default, PCI segment is 0, and can be ↴

↳ omitted.

For example, to map UART-HID:UID AMD0020:0 ↴

↳ to

PCI segment 0x1 and PCI device ID 00:14.5, write the parameter as:

```
ivrs_acpihid=AMD0020:0@0001:00:14.5
```

Deprecated formats:

\* To map UART-HID:UID AMD0020:0 to PCI  
 ↳ segment is 0,  
 ↳ parameter as:  
 ↳ segment 0x1 and  
 ↳ parameter as:  
 ↳ js=  
 ↳ nokaslr  
 ↳ disables  
 ↳ Space  
 ↳ kasan\_multi\_shot  
 ↳ Sanitizer) to print  
 ↳ Without this  
 ↳ the first  
 ↳ keepinitrd  
 ↳ kernelcore=  
 ↳ memory usable by  
 ↳ The requested  
 ↳ nodes in the  
 ↳ memory is used for  
 ↳ MOVABLE. In the  
 ↳ ZONE\_NORMAL and  
 ↳ priority and

[HW,HID] Analog joystick  
 See Documentation/input/joydev/joystick.rst.

[KNL]  
 When CONFIG\_RANDOMIZE\_BASE is set, this  
 kernel and module base offset ASLR (Address  
 Layout Randomization).

[KNL] Enforce KASAN (Kernel Address  
 report on every invalid memory access.  
 parameter KASAN will print report only for  
 invalid access.

[HW,ARM]

[KNL,X86,IA-64,PPC]  
 Format: nn[KMGTP] | nn% | "mirror"  
 This parameter specifies the amount of  
 the kernel for non-movable allocations.  
 amount is spread evenly throughout all  
 system as ZONE\_NORMAL. The remaining  
 movable memory in its own zone, ZONE\_  
 event, a node is too small to have both  
 ZONE\_MOVABLE, kernelcore memory will take  
 other nodes will have a larger ZONE\_MOVABLE.  
 ZONE\_MOVABLE is used for the allocation of

→ pages that may be reclaimed or moved by the page subsystem. Note that allocations like still use the HighMem zone if it exists, zone if it does not.

→ migration

→ PTEs-from-HighMem

→ and the Normal

→ of memory in the form of "nn[KMGTP]", a percentage of memory in the form of "nn%", or "mirror". If "mirror" option is specified, mirrored (reliable) for non-movable allocations and remaining for Movable pages. "nn[KMGTP]", "nn%", are exclusive, so you cannot specify

→ multiple forms.

kgdbdbgp=[KGDB,HW] kgdb over EHCI usb debug port.  
Format: <Controller#>[,poll interval]  
The controller # is the number of the ehci port as it is probed via PCI. The poll optional and is the number seconds in each poll cycle to the debug port in case the functionality for interrupting the gdb or control-c on the dbgp connection. not using this parameter you use sysrq-g to the kernel debugger.

kgdboc=[KGDB,HW] kgdb over consoles.  
Requires a tty driver that supports console or a supported polling keyboard driver  
Serial only format: <serial\_device>[,baud]  
Keyboard only format: kbd  
Keyboard and serial format: kbd,<serial\_device>[,baud]

Optional Kernel mode setting:  
 kms, kbd format: kms,kbd  
 kms, kbd and serial format: kms,kbd,<ser\_

↳dev>[ ,baud]

kgdboc\_earlycon= [KGDB,HW]  
 If the boot console provides the ability to  
 ↳read characters and can work in polling mode,  
 ↳you can use this parameter to tell kgdb to use it as a  
 ↳backend until the normal console is registered.  
 ↳Intended to be used together with the kgdboc parameter  
 ↳which specifies the normal console to transition  
 ↳to.

↳specified The name of the early console should be  
 ↳the name of as the value of this parameter. Note that  
 ↳the tty the early console might be different than  
 ↳value name passed to kgdboc. It's OK to leave the  
 ↳implements blank and the first boot console that  
 ↳read() will be picked.

kgdbwait [KGDB] Stop kernel execution and enter the kernel debugger at the earliest opportunity.

kmac= [MIPS] Korina ethernet MAC address.  
 Configure the RouterBoard 532 series on-chip Ethernet adapter MAC address.

kmemleak= [KNL] Boot-time kmemleak enable/disable  
 Valid arguments: on, off  
 Default: on  
 Built with CONFIG\_DEBUG\_KMEMLEAK\_DEFAULT\_  
 ↳OFF=y, the default is off.

kprobe\_event=[probe-list]  
 [FTRACE] Add kprobe events and enable at  
 ↳boot time. The probe-list is a semicolon delimited  
 ↳list of probe definitions. Each definition is same as

↳ kprobe\_events  
↳ delimited.  
↳ read with  
↳ interface, but the parameters are comma-separated.  
For example, to add a kprobe event on vfs\_read with arguments arg1 and arg2, add to the command line;  
  
kprobe\_event=p,vfs\_read,\$arg1,\$arg2

See also Documentation/trace/kprobeftrace.  
↳ rst "Kernel Boot Parameter" section.

kpti=  
[ARM64] Control page table isolation of user and kernel address spaces.  
Default: enabled on cores which need it.  
↳ mitigation.  
0: force disabled  
1: force enabled

kvm.ignore\_msrs=[KVM] Ignore guest accesses to unhandled MSRs.  
Default is 0 (don't ignore, but inject #GP)

kvm.enable\_vmware\_backdoor=[KVM] Support VMware backdoor PV interface.  
Default is false (don't support).

kvm.mmu\_audit= [KVM] This is a R/W parameter which allows auditing KVM MMU at runtime.  
Default is 0 (off)

kvm.nx\_huge\_pages=  
[KVM] Controls the software workaround for the X86\_BUG\_ITLB\_MULTIHIT bug.  
force : Always deploy workaround.  
off : Never deploy workaround.  
auto : Deploy workaround based on the X86\_BUG\_ITLB\_MULTIHIT.  
Default is 'auto'.  
If the software workaround is enabled for the host, guests do not need to enable it for nested guests.

kvm.nx\_huge\_pages\_recovery\_ratio=

**kvm-zap\_interval=** [KVM] Controls how many 4KiB pages are periodically zapped back to huge pages. 0 disables the recovery, otherwise if the value is N KVM will zap 1/Nth of the 4KiB pages every minute. The default is 60.

**kvm-amd.nested=** [KVM,AMD] Allow nested virtualization in KVM/SVM. Default is 1 (enabled)

**kvm-amd.npt=** [KVM,AMD] Disable nested paging for all guests. Default is 1 (enabled) if in 64-bit or 32-bit PAE mode.

**kvm-arm.vgic\_v3\_group0\_trap=** [KVM,ARM] Trap guest accesses to GICv3 system registers

**kvm-arm.vgic\_v3\_group1\_trap=** [KVM,ARM] Trap guest accesses to GICv3 system registers

**kvm-arm.vgic\_v3\_common\_trap=** [KVM,ARM] Trap guest accesses to GICv3 system registers

**kvm-arm.vgic\_v4\_enable=** [KVM,ARM] Allow use of GICv4 for direct injection of LPIS.

**kvm\_cma\_resv\_ratio=n** [PPC] Reserves given percentage from system memory area for contiguous memory allocation for KVM hash pagetable allocation. By default it reserves 5% of total system memory.
   
Format: <integer>
   
Default: 5

**kvm-intel.ept=** [KVM,Intel] Disable extended page tables (virtualized MMU) support on capable Intel

```
↳ chips.
    Default is 1 (enabled)

    kvm-intel.emulate_invalid_guest_state=
        [KVM,Intel] Disable emulation of invalid_
    ↳ guest state.
        Ignored if kvm-intel.enable_unrestricted_
    ↳ guest=1, as
        guest state is never invalid for_
    ↳ unrestricted guests.
        This param doesn't apply to nested guests_
    ↳ (L2), as KVM
        never emulates invalid L2 guest state.
        Default is 1 (enabled)

    kvm-intel.flexpriority=
        [KVM,Intel] Disable FlexPriority feature_
    ↳ (TPR shadow).
        Default is 1 (enabled)

    kvm-intel.nested=
        [KVM,Intel] Enable VMX nesting (nVMMX).
        Default is 0 (disabled)

    kvm-intel.unrestricted_guest=
        [KVM,Intel] Disable unrestricted guest_
    ↳ feature
        (virtualized real and unpaged mode) on_
    ↳ capable
        Intel chips. Default is 1 (enabled)

    kvm-intel.vmentry_l1d_flush=[KVM,Intel] Mitigation for L1_
    ↳ Terminal Fault
        CVE-2018-3620.

        Valid arguments: never, cond, always

        always: L1D cache flush on every VMENTER.
        cond:   Flush L1D on VMENTER only when the_
    ↳ code between
        VMEXIT and VMENTER can leak host_
    ↳ memory.
        never: Disables the mitigation

        Default is cond (do L1 cache flush in_
    ↳ specific instances)

    kvm-intel.vpid= [KVM,Intel] Disable Virtual Processor_
    ↳ Identification
        feature (tagged TLBs) on capable Intel_
    ↳ chips.
```

	Default is 1 (enabled)
↳ l1tf=	[X86] Control mitigation of the L1TF <u>↳ vulnerability on affected CPUs</u>
↳ unconditionally	The kernel PTE inversion protection is <u>↳ enabled and cannot be disabled.</u>
↳ full	Provides all available mitigations <u>↳ L1TF vulnerability. Disables SMT and enables all mitigations in the hypervisors, i.e. unconditional L1D<u>↳ flush.</u></u>
↳ via the sysfs interface is still possible <u>↳ after boot. Hypervisors will issue a<u>↳ warning when the first VM is started in a potentially insecure configuration, i.e. SMT enabled or L1D flush<u>↳ disabled.</u></u></u>	
↳ full,force	Same as 'full', but disables SMT <u>↳ flush runtime control. Implies the 'nosmt=force' command line option. (i.e. sysfs control of SMT is<u>↳ disabled.)</u></u>
↳ flush	Leaves SMT enabled and enables the <u>↳ hypervisor mitigation, i.e.<u>↳ L1D flush.</u></u>
↳ via the sysfs interface is still possible <u>↳ after boot. Hypervisors will issue a<u>↳ warning when the first VM is started in a</u></u>	

↳ disabled.	flush, nosmt	potentially insecure configuration, i.e. SMT enabled or L1D flush
↳ via the ↳ after ↳ warning ↳ disabled.	flush, nosmt	Disables SMT and enables the default hypervisor mitigation. SMT control and L1D flush control sysfs interface is still possible boot. Hypervisors will issue a warning when the first VM is started in a potentially insecure configuration, i.e. SMT enabled or L1D flush
↳ will not ↳ potentially	flush, nowarn	Same as 'flush', but hypervisors warn when a VM is started in a insecure configuration.
↳ doesn't ↳ available ↳ hypervisor and	off	Disables hypervisor mitigations and emit any warnings. It also drops the swap size and RAM limit restriction on both bare metal.
↳ hw-vuln/l1tf.rst		Default is 'flush'. For details see: Documentation/admin-guide/ hw-vuln/l1tf.rst
↳ BIOS	l2cr= [PPC]	
	l3cr= [PPC]	
↳ BIOS	lapic	[X86-32, APIC] Enable the local APIC even if disabled it.
	lapic=	[X86, APIC] Do not use TSC deadline

value for LAPIC timer one-shot  
 ↵implementation. Default back to the programmable timer unit in the  
 ↵LAPIC.  
 Format: notscdeadline

laptic\_timer\_c2\_ok [X86,APIC] trust the local apic  
 ↵timer in C2 power state.

libata.dma= [LIBATA] DMA control  
 ↵DMA libata.dma=0 Disable all PATA and SATA  
 ↵only libata.dma=1 PATA and SATA Disk DMA  
 ↵enables DMA libata.dma=2 ATAPI (CDROM) DMA only

 Combinations also work, so libata.dma=3  
 for disks and CDROMs, but not CFs.

libata.ignore\_hpa= [LIBATA] Ignore HPA limit  
 ↵(default) libata.ignore\_hpa=0 keep BIOS limits  
 ↵using full disk libata.ignore\_hpa=1 ignore limits,

libata.noacpi [LIBATA] Disables use of ACPI in libata  
 ↵suspend/resume when set.  
 Format: <int>

libata.force= [LIBATA] Force configurations. The format  
 ↵is comma separated list of "[ID:]VAL" where ID is  
 ↵numbers PORT[.DEVICE]. PORT and DEVICE are decimal  
 ↵it matches matching port, link or device. Basically,  
 ↵libata. If the ATA ID string printed on console by  
 ↵and DEVICE the whole ID part is omitted, the last PORT  
 ↵specified yet, the values are used. If ID hasn't been  
 ↵and devices. configuration applies to all ports, links  
 ↵applies to If only DEVICE is omitted, the parameter  
 the port and all links and devices behind

→ it. DEVICE  
→ or the  
→ does not  
→ selects the  
→ force. As long  
→ is allowed.  
→ for 1.5Gbps.  
→ or sata.  
→ udma[0-7].  
→ is also  
→ support

number of 0 either selects the first device, or the first fan-out link behind PMP device. It, select the host link. DEVICE number of 15, host link and device attached to it.

The VAL specifies the configuration to, as there's no ambiguity shortcut notation. For example, both 1.5 and 1.5G would work.

The following configurations can be forced.

- \* Cable type: 40c, 80c, short40c, unk, ign, Any ID with matching PORT is used.
- \* SATA link speed limit: 1.5Gbps or 3.0Gbps.
- \* Transfer mode: pio[0-7], mwdma[0-4] and udma[/][16,25,33,44,66,100,133] notation, allowed.
- \* [no]ncq: Turn on or off NCQ.
- \* [no]ncqtrim: Turn off queued DSM TRIM.
- \* nohrst, nosrst, norst: suppress hard, soft and both resets.
- \* rstone: only attempt one reset during hot-unplug link recovery
- \* dump\_id: dump IDENTIFY data.
- \* atapi\_dmadir: Enable ATAPI DMADIR bridge, disable: Disable this device.

If there are multiple matching configurations changing the same attribute, the last one is used.

memblock=debug [KNL] Enable memblock debug messages.

```

load_ramdisk= [RAM] [Deprecated]

lockd.nlm_grace_period=P [NFS] Assign grace period.
Format: <integer>

lockd.nlm_tcport=N [NFS] Assign TCP port.
Format: <integer>

lockd.nlm_timeout=T [NFS] Assign timeout value.
Format: <integer>

lockd.nlm_udport=M [NFS] Assign UDP port.
Format: <integer>

lockdown= [SECURITY]
{ integrity | confidentiality }
Enable the kernel lockdown feature. If set ↴
to
integrity, kernel features that allow ↴
userland to
modify the running kernel are disabled. If ↴
set to
confidentiality, kernel features that allow ↴
userland
to extract confidential information from ↴
the kernel
are also disabled.

locktorture.nreaders_stress= [KNL]
Set the number of locking read-acquisition ↴
kthreads.
Defaults to being automatically set based ↴
on the
number of online CPUs.

locktorture.nwriters_stress= [KNL]
Set the number of locking write-acquisition ↴
kthreads.

locktorture.onoff_holdoff= [KNL]
Set time (s) after boot for CPU-hotplug ↴
testing.

locktorture.onoff_interval= [KNL]
Set time (s) between CPU-hotplug operations,
or
zero to disable CPU-hotplug testing.

locktorture.shuffle_interval= [KNL]
Set task-shuffle interval (jiffies). ↴

```

↳ Shuffling tasks allows some CPUs to go into „idle“ mode during the locktorture test.

↳ dyntick-idle

locktorture.shutdown\_secs= [KNL]  
Set time (s) after boot system shutdown. „idle“ mode is useful for hands-off automated testing.

locktorture.stat\_interval= [KNL]  
Time (s) between statistics printk()s.

locktorture.stutter= [KNL]  
Time (s) to stutter testing, for example, specifying five seconds causes the test to „idle“ for five seconds, wait for five seconds, and so on. This tests the locking primitive's ability to transition abruptly to and from idle.

locktorture.torture\_type= [KNL]  
Specify the locking implementation to test.

locktorture.verbose= [KNL]  
Enable additional printk() statements.

logibm.irq= [HW,MOUSE] Logitech Bus Mouse Driver Format: <irq>

↳ loglevel= All Kernel Messages with a loglevel smaller than the console loglevel will be printed to the console. It can also be changed with klogd or other programs. The loglevels are defined as follows:

0 (KERN_EMERG)	system is unusable
1 (KERN_ALERT)	action must be taken immediately
2 (KERN_CRIT)	critical conditions
3 (KERN_ERR)	error conditions
4 (KERN_WARNING)	warning conditions
5 (KERN_NOTICE)	normal but significant condition
6 (KERN_INFO)	informational
7 (KERN_DEBUG)	debug-level messages

log\_buf\_len=n[KMG] Sets the size of the printk ring.  
 ↵buffer, in bytes. n must be a power of two and  
 ↵greater than the minimal size. The minimal size is  
 ↵defined by LOG\_BUF\_SHIFT kernel config parameter.  
 ↵There is also CONFIG\_LOG\_CPU\_MAX\_BUF\_SHIFT config  
 ↵parameter that allows to increase the default size  
 ↵depending on the number of CPUs. See init/Kconfig for  
 ↵more details.

logo.nologo [FB] Disables display of the built-in Linux.  
 ↵logo. This may be used to provide more screen  
 ↵space for kernel log messages and is useful when  
 ↵debugging kernel boot problems.

lp=0 [LP] Specify parallel ports to use, e.g,  
 ↵lp=port[,port...] lp=none,parport0 (lp0 not  
 ↵configured, lp1 uses first parallel port). 'lp=0'  
 ↵disables the printer driver. 'lp=reset' (which  
 ↵lp=auto specified in addition to the ports)  
 ↵can be attached printers to be reset. Using  
 ↵causes lp=port1,port2,... specifies the  
 ↵parallel ports to associate lp devices with,  
 ↵starting with lp0. A port specification may be  
 ↵'none' to skip that lp device, or a parport name  
 ↵such as 'parport0'. Specifying 'lp=auto'  
 ↵instead of a port specification list means that  
 ↵device IDs from each port should be examined,  
 ↵to see if an IEEE 1284-compliant printer is  
 ↵attached; if so, the driver will manage that  
 ↵printer.

See also header of drivers/char/lp.

→ C.

lpj=n [KNL]  
Sets loops\_per\_jiffy to given constant, thus avoiding time-consuming boot-time autodetection (up to 250 ms per CPU). 0 enables autodetection (default). To determine the correct value for your kernel, boot autodetection and see what value is printed. on SMP systems the preset will be applied which is likely to cause problems if your CPUs need significantly divergent settings. An will cause delays in the kernel to be wrong, unpredictable I/O errors and other breakage. Although unlikely, in the extreme case this might damage your hardware.

ltpc= [NET]  
Format: <io>,<irq>,<dma>  
lsm.debug [SECURITY] Enable LSM initialization  
debugging output.

lsm=lsm1,...,lsmN [SECURITY] Choose order of LSM  
initialization. This overrides CONFIG\_LSM, and the "security=" parameter.

machvec= [IA-64] Force the use of a particular machine-vector (machvec) in a generic kernel.  
Example: machvec=hpzx1

machtype= [Loongson] Share the same kernel image file between different yeeloong laptops.  
Example: machtype=lemote-yeeloong-2f-7inch

max\_addr=nn[KMG] [KNL,BOOT,ia64] All physical memory

→ greater	than or equal to this physical address is.
→ ignored.	
maxcpus=	[SMP] Maximum number of processors that an
→ SMP kernel	will bring up during bootup. maxcpus=n : n
≥ 0 limits	the kernel to bring up 'n' processors.
→ Surely after	bootup you can bring up the other plugged
→ cpu by executing	"echo 1 > /sys/devices/system/cpu/cpuX/
→ online". So maxcpus	only takes effect during system bootup. While n=0 is a special case, it is,
→ equivalent to "nosmp",	which also disables the IO APIC.
max_loop=	[LOOP] The number of loop block devices
→ that get	(loop.max_loop) unconditionally pre-created at init time.
→ The default	number is configured by BLK_DEV_LOOP_MIN_
→ COUNT. Instead	of statically allocating a predefined
→ number, loop	devices can be requested on-demand with the /dev/loop-control interface.
mce	[X86-32] Machine Check Exception
mce=option	[X86-64] See Documentation/x86/x86_64/
→ boot-options.rst	
md=	[HW] RAID subsystems devices and level See Documentation/admin-guide/md.rst.
mdacon=	[MDA] Format: <first>,<last> Specifies range of consoles to be captured
→ by the MDA.	
mds=	[X86,INTEL] Control mitigation for the
→ Micro-architectural Data	Sampling (MDS) vulnerability.
→ against CPU	Certain CPUs are vulnerable to an exploit internal buffers which can forward

↳ information to a disclosure gadget under certain conditions.

↳ channel

↳ attacker does not have direct access.

↳ The options are:

↳ vulnerable CPUs

↳ disable

↳ mitigation

↳ prevented by

↳ vulnerabilities are

↳ order to disable

↳ `async_abort=off`

On TAA-affected machines, `mds=off` can be an active TAA mitigation as both mitigated with the same mechanism so in this mitigation, you need to specify `tsx_` too.

Not specifying this option is equivalent to `mds=full`.

For details see: Documentation/admin-guide/

↳ `hw-vuln/mds.rst`

`mem=nn[KMG]` [KNL,BOOT] Force usage of a specific amount

    ↳ of memory Amount of memory to be used in cases as

    ↳ follows:

        1 for test;

        2 when the kernel is not able to see the

        3 memory that lies after '`mem=`' boundary is

            the hypervisor, then assigned to KVM

↳ whole system memory;

↳ excluded from

↳ guests.

[X86] Work as limiting max address. Use `together` with `memmap=` to avoid physical address `space collisions.` Without `memmap=` PCI devices could be placed `at addresses` belonging to unused RAM.

Note that this only takes effects during `boot time since` in above case 3, memory may need be hot `added after boot` if system memory of hypervisor is not `sufficient.`

`mem=nopentium` [BUGS=X86-32] Disable usage of 4MB pages `for kernel` memory.

`memchunk=nn[KMG]` [KNL,SH] Allow user to override the default `size for` per-device physically contiguous DMA `buffers.`

`memhp_default_state=online/offline` [KNL] Set the initial state for the memory `hotplug` onlining policy. If not specified, the `default value is` set according to the `CONFIG_MEMORY_HOTPLUG_DEFAULT_ONLINE` kernel `config` option. See Documentation/admin-guide/mm/`memory-hotplug.rst.`

`memmap=exactmap` [KNL,X86] Enable setting of an exact E820 memory map, as specified by the user. Such `memmap=exactmap` lines can be `constructed based on` BIOS output or other requirements. See the `memmap=nn@ss` option description.

`memmap=nn[KMG]@ss[KMG]` [KNL] Force usage of a specific region of `memory.` Region of memory to be used is from `ss` to `ss+nn.` If `@ss[KMG]` is omitted, it is equivalent to

→mem=nn[KMG],  
which limits max address to nn[KMG].  
Multiple different regions can be specified,  
comma delimited.  
Example:  
memmap=100M@2G,100M#3G,1G!1024G

memmap=nn[KMG]#ss[KMG]  
[KNL,ACPI] Mark specific memory as ACPI  
→data.  
Region of memory to be marked is from ss to  
→ss+nn.

memmap=nn[KMG]\$ss[KMG]  
[KNL,ACPI] Mark specific memory as reserved.  
Region of memory to be reserved is from ss  
→to ss+nn.  
Example: Exclude memory from  
→0x18690000-0x1869ffff  
memmap=64K\$0x18690000  
or  
memmap=0x10000\$0x18690000  
Some bootloaders may need an escape  
→character before '\$',  
like Grub2, otherwise '\$' and the following  
→number  
will be eaten.

memmap=nn[KMG]!ss[KMG]  
[KNL,X86] Mark specific memory as protected.  
Region of memory to be used, from ss to  
→ss+nn.  
The memory region may be marked as e820  
→type 12 (0xc)  
and is NVDIMM or ADR memory.

memmap=<size>%<offset>-<oldtype>+<newtype>  
[KNL,ACPI] Convert memory within the  
→specified region  
from <oldtype> to <newtype>. If "-<oldtype>  
→" is left  
out, the whole region will be marked as  
→<newtype>,  
even if previously unavailable. If "+  
→<newtype>" is left  
out, matching memory will be removed. Types  
→are  
→reserved,  
specify as e820 types, e.g., 1 = RAM, 2 =  
3 = ACPI, 12 = PRAM.

```

memory_corruption_check=0/1 [X86]
    Some BIOSes seem to corrupt the first 64k of
    memory when doing things like suspend/
→resume.

→kernel
    Setting this option will scan the memory
    looking for corruption. Enabling this will
    both detect corruption and prevent the ↵
from using the memory being corrupted.
However, its intended as a diagnostic tool; ↵

→if
    repeatable BIOS-originated corruption always
    affects the same memory, you can use memmap=
    to prevent the kernel from using that ↵

→memory.

memory_corruption_check_size=size [X86]
    By default it checks for corruption in the ↵
→low
    64k, making this memory unavailable for ↵

→normal
    use. Use this parameter to scan for
    corruption in more or less memory.

memory_corruption_check_period=seconds [X86]
    By default it checks for corruption every 60
    seconds. Use this parameter to check at ↵
→some
    other rate. 0 disables periodic checking.

memtest=
    [KNL,X86,ARM,PPC] Enable memtest
    Format: <integer>
    default : 0 <disable>
    Specifies the number of memtest passes to be
    performed. Each pass selects another test
    pattern from a given set of patterns. ↵

→Memtest
    fills the memory with this pattern, ↵

→validates
    memory contents and reserves bad memory
    regions that are detected.

mem_encrypt=
    [X86-64] AMD Secure Memory Encryption (SME) ↵
→control
    Valid arguments: on, off
    Default (depends on kernel configuration) ↵

→option):
    on  (CONFIG_AMD_MEM_ENCRYPT_ACTIVE_BY_
→DEFAULT=y)
    off (CONFIG_AMD_MEM_ENCRYPT_ACTIVE_BY_
→DEFAULT=n)

```

mem\_encrypt=on: Activate SME  
mem\_encrypt=off: Do not activate SME

Refer to Documentation/virt/kvm/  
amd-memory-encryption.rst  
for details on when memory encryption can  
be activated.

mem\_sleep\_default= [SUSPEND] Default system suspend  
mode:  
s2idle - Suspend-To-Idle  
shallow - Power-On Suspend or equivalent  
(if supported)  
deep - Suspend-To-RAM or equivalent (if  
supported)

    mminit_loglevel=                         [KNL] When CONFIG_DEBUG_MEMORY_INIT is set, this parameter allows control of the logging of additional memory initialisation checks. A value of 0 disables mminit logging and a level of 4 will log everything. Information is printed at KERN_DEBUG so loglevel=8 may also need to be specified.

    mmio_stale_data=                         [X86,INTEL] Control mitigation for the Processor MMIO Stale Data vulnerabilities.

Processor MMIO Stale Data is a class of vulnerabilities that may expose data after an MMIO operation. Exposed data could originate or the same CPU buffers as affected by MDS and TAA. Therefore, similar to MDS and TAA, the mitigation is to clear the affected CPU buffers.

This parameter controls the mitigation. The options are:

full      - Enable mitigation on vulnerable CPUs
full,nosmt - Enable mitigation and disable vulnerable CPUs.

off       - Unconditionally disable

On MDS or TAA affected machines, mmio_stale_data=off can be prevented by an active MDS or TAA mitigation as these vulnerabilities are

```

mitigated with the same mechanism so in order to disable this mitigation, you need to specify mds=off and tsx\_async\_abort=off too.

Not specifying this option is equivalent to mmio\_stale\_data=full.

For details see:  
Documentation/admin-guide/hw-vuln/processor\_mmio\_stale\_data.rst

module.sig\_enforce [KNL] When CONFIG\_MODULE\_SIG is set, this means that modules without (valid) signatures will fail to load. Note that if CONFIG\_MODULE\_SIG\_FORCE is set, is always true, so this option does nothing.

module\_blacklist= [KNL] Do not load a comma-separated list of modules. Useful for debugging problems.

mousedev.tap\_time= [MOUSE] Maximum time between finger touching and leaving touchpad surface for touch to be considered a tap and be reported as a left button (for touchpads working in absolute mode only). Format: <msecs>

mousedev.xres= [MOUSE] Horizontal screen resolution, used for devices reporting absolute coordinates, such as tablets

mousedev.yres= [MOUSE] Vertical screen resolution, used for devices reporting absolute coordinates, such as tablets

movablecore= [KNL,X86,IA-64,PPC] Format: nn[KMGTPE] | nn% This parameter is the complement to kernelcore=, it specifies the amount of memory used for migratable allocations. If both kernelcore and

↵movablecore is specified, then kernelcore will be at ↵\*least\* the specified value but may be more. If ↵movablecore on its own is specified, the administrator must be ↵careful that the amount of memory usable for all ↵allocations is not too small.

movable\_node [KNL] Boot-time switch to make hotpluggable ↵memory NUMA nodes to be movable. This means that ↵the memory of such nodes will be usable only for ↵movable allocations which rules out almost all ↵kernel allocations. Use with caution!

MTD\_Partition= [MTD] Format: <name>,<region-number>,<size>,  
 ↵<offset>

MTD\_Region= [MTD] Format:  
 <name>,<region-number>[,<base>,<size>,  
 ↵<buswidth>,<altbuswidth>]

mtdparts= [MTD]  
 See drivers/mtd/parsers/cmdlinepart.c

multitce=off [PPC] This parameter disables the use of ↵the pSeries firmware feature for updating multiple TCE ↵entries at a time.

onenand.bdry= [HW,MTD] Flex-OneNAND Boundary Configuration  
 Format: [die0\_boundary][,die0\_lock][,die1\_boundary][,die1\_lock]  
 ↵Flex-OneNAND. boundary - index of last SLC block on ↵configured as MLC blocks. The remaining blocks are ↵boundary should be locked. lock - Configure if Flex-OneNAND ↵be changed. Once locked, the boundary cannot

1 indicates lock status, 0 indicates unlock status.

**mtdset=** [ARM]  
ARM/S3C2412 JIVE boot control  
See arch/arm/mach-s3c2412/mach-jive.c

**mtouchusb.raw\_coordinates=**  
[HW] Make the MicroTouch USB driver use raw coordinates ('y', default) or cooked coordinates ('n')

**mtrr\_chunk\_size=nn[KMG]** [X86]  
used for mtrr cleanup. It is largest continuous chunk that could hold holes aka. UC entries.

**mtrr\_gran\_size=nn[KMG]** [X86]  
Used for mtrr cleanup. It is granularity of mtrr block.  
Default is 1.  
Large value could prevent small alignment from using up MTRRs.

**mtrr\_spare\_reg\_nr=n** [X86]  
Format: <integer>  
Range: 0,7 : spare reg number  
Default : 1  
Used for mtrr cleanup. It is spare mtrr entries number.  
Set to 2 or more if your graphical card needs more.

**n2=** [NET] SDL Inc. RISCom/N2 synchronous serial card

**netdev=<name>** [NET] Network devices parameters  
Format: <irq>,<io>,<mem\_start>,<mem\_end>,  
Note that mem\_start is often overloaded to something different and driver-specific.  
This usage is only documented in each driver source file if at all.

**nf\_conntrackacct=** [NETFILTER] Enable connection tracking flow accounting

0 to disable accounting  
 1 to enable accounting  
 Default value is 0.

**nfsaddrs=** [NFS] Deprecated. Use ip= instead.  
 See Documentation/admin-guide/nfs/nfsroot.

**rst.**

**nfsroot=** [NFS] nfs root filesystem for disk-lessu  
 See Documentation/admin-guide/nfs/nfsroot.

**rst.**

**nfsrootdebug** [NFS] enable nfsroot debugging messages.  
 See Documentation/admin-guide/nfs/nfsroot.

**rst.**

**nfs.callback\_nr\_threads=** [NFSv4] set the total number of threadsu  
 that the NFS client will assign to service NFSv4u  
 requests.

**nfs.callback\_tcpport=** [NFS] set the TCP port on which the NFSv4u  
 channel should listen.

**nfs.cache\_getent=** [NFS] sets the pathname to the programu  
 which is used to update the NFS client cache entries.

**nfs.cache\_getent\_timeout=** [NFS] sets the timeout after which anu  
 attempt to update a cache entry is deemed to haveu  
 failed.

**nfs.idmap\_cache\_timeout=** [NFS] set the maximum lifetime for idmapperu  
 entries.

**nfs.enable\_ino64=** [NFS] enable 64-bit inode numbers.  
 If zero, the NFS client will fake up au  
 32-bit inode number for the readdir() and stat()u  
 syscalls instead

of returning the full 64-bit number.  
The default is to return 64-bit inodenumbers.

nfs.max\_session\_cb\_slots=  
[NFSv4.1] Sets the maximum number of session slots the client will assign to the callback channel. This determines the maximum numberof callbacks the client will process inparallel for a particular server.

nfs.max\_session\_slots=  
[NFSv4.1] Sets the maximum number ofsession slots the client will attempt to negotiate withthe server. This limits the number of simultaneous RPCrequests that the client can send to the NFSv4.1server. Note that there is little point in settingthis value higher than the max\_tcp\_slot\_table\_limit.

nfs.nfs4\_disable\_idmapping=  
[NFSv4] When set to the default of '1',this option ensures that both the RPC levelauthentication scheme and the NFS level operations agreeto use numeric uids/gids if the mount is using the 'sec=sys' security flavour. In effect it is disabling idmapping, which can makemigration from legacy NFSv2/v3 systems to NFSv4 easier. Servers that do not support this mode ofoperation will be autodetected by the client, and itwill fall back to using the idmapper. To turn off this behaviour, set the valueto '0'.

nfs.nfs4\_unique\_id=  
[NFS4] Specify an additional fixed uniqueident-ification string that NFSv4 clients caninsert into

their nfs\_client\_id4 string. This is a typically a UUID that is generated at system install time.

```
nfs.send_implementation_id =
    [NFSv4.1] Send client implementation identification information in exchange_id requests. If zero, no implementation identification will be sent. The default is to send the implementation identification information.
```

nfs.recover\_lost\_locks =
 [NFSv4] Attempt to recover locks that were lost due to a lease timeout on the server. Please note that doing this risks data corruption, since there are no guarantees that the file will remain unchanged after the locks are lost. If you want to enable the kernel legacy behaviour of attempting to recover these locks, then set this parameter to '1'. The default parameter value of '0' causes the kernel not to attempt recovery of lost locks.

```
nfs4.layoutstats_timer =
    [NFSv4.2] Change the rate at which the kernel sends layoutstats to the pNFS metadata server. Setting this to value to 0 causes the kernel to use whatever value is the default set by the layout driver. A non-zero value sets the minimum interval in seconds between layoutstats transmissions.
```

```
nfsd.nfs4_disable_idmapping=
    [NFSv4] When set to the default of '1', the
```

↳ NFSv4  
↳ gids to numeric uids  
↳ intended to ease migration from NFSv2/v3.  
  
nmi\_backtrace.backtrace\_idle [KNL]  
Dump stacks even of idle CPUs in response to an NMI stack-backtrace request.  
  
nmi\_debug= [KNL,SH] Specify one or more actions to take when a NMI is triggered.  
Format: [state][,regs][,debounce][,die]  
  
nmi\_watchdog= [KNL,BUGS=X86] Debugging features for SMP kernels  
↳ watchdog off  
↳ watchdog on  
↳ watchdog  
↳ on an NMI  
↳ PANIC is set)  
↳ detectors,  
↳ timeout and  
↳ via  
↳ sysctls.  
  
netpoll.carrier\_timeout=  
[NET] Specifies amount of time (in seconds) that default netpoll  
netpoll should wait for a carrier. By waits 4 seconds.

no387	[BUGS=X86-32] Tells the kernel to use the emulation library even if a 387 maths coprocessor is present.
→387 maths	
→coprocessor	
no5lvl	[X86-64] Disable 5-level paging mode. Forces kernel to use 4-level paging instead.
nofsgsbase	[X86] Disables FSGSBASE instructions.
no_console_suspend	[HW] Never suspend the console. Disable suspending of consoles during suspend and debugging the rest while. This may known also add to control →suspend) to
	hibernate operations. Once disabled, messages can reach various consoles while of the system is being put to sleep (ie, debugging driver suspend/resume hooks). not work reliably with all consoles, but is to work with serial and VGA consoles. To facilitate more flexible debugging, we console_suspend, a printk module parameter. Users could use console_suspend (usually /sys/module/printk/parameters/console_ turn on/off it dynamically.
novmcoredd	[KNL,KDUMP] Disable device dump. Device dump allows drivers to collect driver the data in memory, → Disabling driver debug parameter
	append dump data to vmcore so you can specified debug info. Drivers can append without any limit and this data is stored so this may cause significant memory stress. device dump can help save memory but the data will be no longer available. This is only available when CONFIG_PROC_VMCORE_

↳ DEVICE_DUMP	is set.
↳ alien	noaliencache [MM, NUMA, SLAB] Disables the allocation of caches in the slab allocator. Saves, but will impact performance.
↳ per-node memory,	noalign [KNL,ARM]
↳ patching	noaltinstr [S390] Disables alternative instructions (CPU alternatives feature).
↳ of any	noapic [SMP,APIC] Tells the kernel to not make use IOAPICs that may be present in the system.
↳ creation.	noautogroup Disable scheduler automatic task group.
↳ lowmem	nobats [PPC] Do not use BATs for mapping kernel on "Classic" PPC cores.
	nocache [ARM]
	noclflush [BUGS=X86] Don't use the CLFLUSH instruction
	nodelayacct [KNL] Disable per-task delay accounting
	nodsp [SH] Disable hardware DSP at boot time.
	noefi Disable EFI runtime services support.
↳ entering the kernel.	no_entry_flush [PPC] Don't flush the L1-D cache when
	noexec [IA-64]
	noexec [X86]
↳ kernels.	On X86-32 available only on PAE configured
↳ (default)	noexec=on: enable non-executable mappings noexec=off: disable non-executable mappings
	nosmap [X86,PPC]
↳ Prevention)	Disable SMAP (Supervisor Mode Access)

	even if it is supported by processor.
nosmep ↳ Prevention)	[X86,PPC] Disable SMEP (Supervisor Mode Execution, even if it is supported by processor.
noexec32 ↳ (default) ↳ mappings ↳ mappings	[X86-64] This affects only 32-bit executables. noexec32=on: enable non-executable mappings, read doesn't imply executable. noexec32=off: disable non-executable, read implies executable mappings
nofpu	[MIPS,SH] Disable hardware FPU at boot time.
nofxsr ↳ extended ↳ only save ↳ switch.	[BUGS=X86-32] Disables x86 floating point register save and restore. The kernel will use legacy floating-point registers on task.
nohugeiomap ↳ mappings.	[KNL,X86,PPC,ARM64] Disable kernel huge I/O.
nosmt ↳ (SMT). ↳ (SMT). ↳ undone	[KNL,S390] Disable symmetric multithreading. Equivalent to smt=1. [KNL,X86] Disable symmetric multithreading. nosmt=force: Force disable SMT, cannot be done via the sysfs control file.
nospectre_v1 ↳ Variant 1 ↳ data leaks are	[X86,PPC] Disable mitigations for Spectre (bounds check bypass). With this option, possible in the system.
nospectre_v2 ↳ mitigations for ↳ prediction) ↳ with this	[X86,PPC_FSL_B00K3E,ARM64] Disable all the Spectre variant 2 (indirect branch) vulnerability. System may allow data leaks.

option.

nospec_store_bypass_disable	[HW] Disable all mitigations for the ↴ Speculative Store Bypass vulnerability
no_uaccess_flush	[PPC] Don't flush the L1-D cache after ↴ accessing user data.
noxsave	[BUGS=X86] Disables x86 extended register ↴ state save and restore using xsave. The kernel will ↴ fallback to enabling legacy floating-point and sse ↴ state.
noxsaveopt	[X86] Disables xsaveopt used in saving x86 ↴ extended register states. The kernel will fall back ↴ to use xsave to save the states. By using this ↴ parameter, performance of saving the states is ↴ degraded because xsave doesn't support modified optimization ↴ while xsaveopt supports it on xsaveopt enabled ↴ systems.
noxsaves	[X86] Disables xsaves and xrstors used in ↴ saving and restoring x86 extended register state in ↴ compacted form of xsave area. The kernel will fall ↴ back to use xsaveopt and xrstor to save and restore the ↴ states in standard form of xsave area. By using ↴ this parameter, xsave area per process might ↴ occupy more memory on xsaves enabled systems.
nohltsleep(SH) or	[BUGS=ARM,SH] Tells the kernel that the ↴ wfi(ARM) instruction doesn't work correctly ↴ and not to use it. This is also useful when using JTAG ↴ debugger.

<code>no_file_caps</code>	Tells the kernel not to honor file capabilities. The only way then for a file to be executed is to be setuid root or executed by root.
<code>nohalt</code>	[IA-64] Tells the kernel not to use the function PAL_HALT_LIGHT when idle. This reduces power-consumption. On the positive side, it increases interrupt wake-up latency, which may in certain environments such as networked real-time systems.
<code>power saving</code>	
<code>increases</code>	
<code>reduces</code>	
<code>improve performance</code>	
<code>servers or</code>	
<code>nohibernate</code>	[HIBERNATION] Disable hibernation and resume.
<code>resume.</code>	
<code>nohz=</code>	[KNL] Boottime enable/disable dynamic ticks Valid arguments: on, off Default: on
<code>nohz_full=</code>	[KNL,BOOT,SMP,ISOL] The argument is a cpu list, as described In kernels built with CONFIG_NO_HZ_FULL=y, the specified list of CPUs whose tick will whenever possible. The boot CPU will be the range to maintain the timekeeping. Any in this list will have their RCU callbacks just as if they had also been called out in rcu_nocbs= boot parameter.
<code>above.</code>	
<code>set</code>	
<code>be stopped</code>	
<code>forced outside</code>	
<code>CPUs</code>	
<code>offloaded,</code>	
<code>the</code>	
<code>noiotrap</code>	[SH] Disables trapped I/O port accesses.
<code>noirqdebug</code>	[X86-32] Disables the code which attempts to detect and disable unhandled interrupt sources.
<code>to detect and</code>	
<code>no_timer_check</code>	[X86,APIC] Disables the code which tests for broken timer IRQ sources.

noisapnp	[ISAPNP] Disables ISA PnP code.
noinitrd ↳ configured	[RAM] Tells the kernel not to load any initial RAM disk.
nointremap ↳ interrupt	[X86-64, Intel-IOMMU] Do not enable remapping. [Deprecated - use intremap=off]
nointroute	[IA-64]
noinvpcid	[X86] Disable the INVPCID cpu feature.
nojitter ↳ timers.	[IA-64] Disables jitter checking for ITC.
no-kvmclock ↳ driver	[X86,KVM] Disable paravirtualized KVM clock.
no-kvmapf ↳ asynchronous page	[X86,KVM] Disable paravirtualized fault handling.
no-vmw-sched-clock ↳ scheduler	[X86,PV_OPS] Disable paravirtualized VMware clock and use the default one.
no-steal-acc ↳ steal time ↳ won't	[X86,PV_OPS,ARM64] Disable paravirtualized accounting. steal time is computed, but influence scheduler behaviour
nolapic ↳ local APIC.	[X86-32,APIC] Do not enable or use the local APIC.
nolapic_timer ↳ timer.	[X86-32,APIC] Do not use the local APIC.
noltlbs ↳ kernel	[PPC] Do not use large page/tlb entries for lowmem mapping on PPC40x and PPC8xx
nomca	[IA-64] Disable machine check abort handling
nomce	[X86-32] Disable Machine Check Exception
nomfgpt	[X86-32] Disable Multi-Function General

## → Purpose

	Timer usage (for AMD Geode machines).
nonmi_ipi ↳ reboot to	[X86] Disable using NMI IPIs during panic/ shutdown the other cpus. Instead use the ↳ irq.
REBOOT_VECTOR	
nomodule	Disable module load
nopat ↳ extension of	[X86] Disable PAT (page attribute table ↳ pagetables) support.
nopcid	[X86-64] Disable the PCID cpu feature.
norandmaps ↳ Equivalent to	Don't use address space randomization. ↳ echo 0 > /proc/sys/kernel/randomize_va_space
noreplace-smp	[X86-32,SMP] Don't replace SMP instructions with UP alternatives
nordrand ↳ supported ↳ still	[X86] Disable kernel use of the RDRAND and RDSEED instructions even if they are ↳ by the processor. RDRAND and RDSEED are ↳ available to user space applications.
noresume ↳ original swap	[SWSUSP] Disables resume and restores ↳ space.
no-scroll ↳ ib80-piezo Braille	[VGA] Disables scrollback. This is required for the Braillex ↳ reader made by F.H. Papenmeier (Germany).
nosbagart	[IA-64]
nosep ↳ support.	[BUGS=X86-32] Disables x86 SYSENTER/SYSEXIT ↳
nosmp ↳ kernel, ↳ "maxcpus=0".	[SMP] Tells an SMP kernel to act as a UP ↳ and disable the IO APIC. legacy for ↳
nosoftlockup	[KNL] Disable the soft-lockup detector.

nosync devices.	[HW,M68K] Disables sync negotiation for all devices.
nowatchdog	[KNL] Disable both lockup detectors, i.e. soft-lockup and NMI watchdog (hard-lockup).
nowb	[ARM]
nox2apic	[X86-64,APIC] Do not enable x2APIC mode.
cpu0_hotplug	[X86] Turn on CPU0 hotplug feature when CONFIG_BOOTPARAM_HOTPLUG_CPU0 is off. Some features depend on CPU0. Known dependencies are:
→CPU0.	1. Resume from suspend/hibernate depends on CPU0. Suspend/hibernate will fail if CPU0 is removed if a PIC interrupt is detected. It's said poweroff/reboot may depend on machines although I haven't seen such after CPU0 is offline on a few tested. If the dependencies are under your control, turn on cpu0_hotplug.
→offline and you →hibernate.	
→can't be	
→CPU0 on some →issues so far →machines.	
→you can	
nps_mtm_hs_ctr=	[KNL,ARC] This parameter sets the maximum duration, in cycles, each HW thread of the CTOP can run without interruptions, before HW switches it. The actual maximum duration is 16 times this parameter's value. Format: integer between 1 and 255 Default: 255
nptcg= global TLB SUMMARY or	[IA-64] Override max number of concurrent purges which is reported from either PAL_VMSAL PALO.
nr_cpus=	[SMP] Maximum number of processors that an

↵SMP kernel  
 ↵the kernel to  
 ↵than the  
 ↵ later in  
 ↵until it reaches  
 ↵for per-cpu  
 ↵physical cpu  
 could support. `nr_cpus=n` :  $n \geq 1$  limits  
 support ' $n$ ' processors. It could be larger  
 number of already plugged CPU during bootup,  
 runtime you can physically add extra cpu  
 $n$ . So during boot up some boot time memory  
 variables need be pre-allocated for later  
 hot plugging.

`nr_uarts=` [SERIAL] maximum number of UARTs to be registered.

`numa_balancing=` [KNL,X86] Enable or disable automatic NUMA balancing.  
 Allowed values are enable and disable

`numa_zonelist_order=` [KNL, BOOT] Select zonelist order for NUMA.  
 'node', 'default' can be specified  
 This can be set from sysctl after boot.  
 See Documentation/admin-guide/sysctl/vm.rst for details.

`ohci1394_dma=early` [HW] enable debugging via the ohci1394 driver.  
 See Documentation/core-api/debugging-via-ohci1394.rst for more info.

`olpc_ec_timeout=` [OLPC] ms delay when issuing EC commands  
 Rather than timing out after 20 ms if an EC command is not properly ACKed, override the length  
 of the timeout. We have interrupts waiting for the ACK, so if this is set too high  
 interrupts \*may\* be lost!

`omap_mux=` [OMAP] Override bootloader pin multiplexing.  
 Format: `<mux_mode0.mode_name=value>...`  
 For example, to override I2C bus2:  
`omap_mux=i2c2_scl.i2c2_scl=0x100,i2c2_sda.i2c2_sda=0x100`

```
oprofile.timer= [HW]
                Use timer interrupt instead of performance counters

oprofile.cpu_type=      Force an oprofile cpu type
                        This might be useful if you have an older
→oprofile
                        userland or if you want common events.
                        Format: { arch_perfmon }
                        arch_perfmon: [X86] Force use of
→architectural
                        perfmon on Intel CPUs instead of the
                        CPU specific event set.
                        timer: [X86] Force use of architectural NMI
                        timer mode (see also oprofile.timer
                        for generic hr timer mode)

oops=panic      Always panic on oopses. Default is to just
→kill the
                        process, but there is a small probability of
                        deadlocking the machine.
                        This will also cause panics on machine
→check exceptions.
                        Useful together with panic=30 to trigger a
→reboot.

page_alloc.shuffle=
                [KNL] Boolean flag to control whether the
→page allocator
                        should randomize its free lists. The
→randomization may
                        be automatically enabled if the kernel
→detects it is
                        running on a platform with a direct-mapped
→memory-side
                        cache, and this parameter can be used to
→of the flag
                        override/disable that behavior. The state
                        can be read from sysfs at:
                        /sys/module/page_alloc/parameters/shuffle.

page_owner=
                [KNL] Boot-time page_owner enabling option.
→allocated
                        Storage of the information about who
→switch,
                        each page is disabled in default. With this
                        we can turn it on.
                        on: enable the feature

page_poison=
                [KNL] Boot-time parameter changing the
→state of
```

poisoning on the buddy allocator, available with  
`CONFIG_PAGE_POISONING=y.`  
 off: turn off poisoning (default)  
 on: turn on poisoning

`panic=` [KNL] Kernel behaviour on panic: delay  
`<timeout>`  
 timeout > 0: seconds before rebooting  
 timeout = 0: wait forever  
 timeout < 0: reboot immediately  
 Format: <timeout>

`panic_print=` Bitmask for printing system info when panic happens.  
`<bits>`  
 User can chose combination of the following  
`is on`  
 bit 0: print all tasks info  
 bit 1: print system memory info  
 bit 2: print timer info  
 bit 3: print locks info if CONFIG\_LOCKDEP is on  
 bit 4: print ftrace buffer  
 bit 5: print all printk messages in buffer

`panic_on_taint=` Bitmask for conditionally calling panic() in add\_taint()  
`<in add_taint()`  
 Format: <hex>[,nousertaint]  
 Hexadecimal bitmask representing the set of TAIN flags that will cause the kernel to panic when called with any of the flags in this set. The optional switch "nousertaint" can be utilized to prevent userspace forced crashes by writing /proc/sys/kernel/tainted any flagset bitmask set on panic\_on\_taint. See Documentation/admin-guide/tainted-kernels.rst for extra details on the taint flags that users can pick to compose the bitmask to assign to panic\_on\_taint.

`panic_on_warn` panic() instead of WARN(). Useful to cause kdump on a WARN().

```

                        ↵paride.rst.

pci=option[,option...]  [PCI] various PCI subsystem options.

                        ↵specific device
                        ↵These are
                        ↵formats:
                        ↵..<func>]*

                        ↵PCI
                        ↵may change
                        ↵motherboard
                        ↵caused
                        ↵function
                        ↵the base
                        ↵format
                        ↵multiple

                        [ <domain>:]<bus>:<dev>.<func>[/<dev>
                        pci:<vendor>:<device>[:<subvendor>:
                        <subdevice>]

                        Note: the first format specifies a
                        bus/device/function address which
                        if new hardware is inserted, if
                        firmware changes, or due to changes
                        by other kernel parameters. If the
                        domain is left unspecified, it is
                        taken to be zero. Optionally, a path
                        to a device through multiple device/
                        addresses can be specified after
                        address (this is more robust against
                        renumbering issues). The second
                        selects devices using IDs from the
                        configuration space which may match
                        devices in the system.

```

ioapicreroute	Safety option to keep boot IRQs enabled. This should never be necessary.
noioapicreroute	[APIC] Enable rerouting of boot IRQs to the primary IO-APIC for bridges that cannot disable spurious IRQs when the system masks IRQs.
biosirq	The opposite of ioapicreroute. [X86-32] Use PCI BIOS calls to get the interrupt routing table. These calls are known to be buggy on several machines and they hang when used, but on other computers it's the only way to get the interrupt routing table. Try this option if the kernel is unable to allocate IRQs or discover secondary PCI buses on your motherboard.
rom	[X86] Assign address space to expansion ROMs. Use with caution as certain devices share address decoders between ROMs and other resources.
norom	[X86] Do not assign address space to expansion ROMs that do not already have BIOS assigned address ranges.

↳ to the BIOS.	nobar	[X86] Do not assign address space BARs that weren't assigned by the
↳ allowed to be devices. You can your ISA cards	irqmask=0xMMMM	[X86] Set a bit mask of IRQs assigned automatically to PCI make the kernel exclude IRQs of this way.
↳ address generated	pirqaddr=0xAAAAAA	[X86] Specify the physical of the PIRQ table (normally by the BIOS) if it is outside the F0000h-100000h range. [X86] Scan all buses thru bus #N.
↳ Can be find your tell it	lastbus=N	useful if the kernel is unable to secondary buses and you want to explicitly which ones they are. [X86] Always assign all PCI bus numbers ourselves, overriding whatever the firmware may have done. [X86] Honor the possible IRQ mask in the BIOS \$PIR table. This is some systems with broken BIOSes, some HP Pavilion N5400 and Omnibook notebooks. This will have no effect IRQ routing is enabled. [X86] Do not use ACPI for IRQ or for PCI scanning. [X86] Use PCI host bridge window from ACPI. On BIOSes from 2008 or is enabled by default. If you need please report a bug. [X86] Ignore PCI host bridge If you need to use this, please
↳ stored needed on notably XE3 if ACPI routing information later, this to use this, windows from ACPI.	assign-busses usepirqmask noacpi use_crs nocrs	[X86] Always assign all PCI bus numbers ourselves, overriding whatever the firmware may have done. [X86] Honor the possible IRQ mask in the BIOS \$PIR table. This is some systems with broken BIOSes, some HP Pavilion N5400 and Omnibook notebooks. This will have no effect IRQ routing is enabled. [X86] Do not use ACPI for IRQ or for PCI scanning. [X86] Use PCI host bridge window from ACPI. On BIOSes from 2008 or is enabled by default. If you need please report a bug. [X86] Ignore PCI host bridge If you need to use this, please

→ report a bug.	routeirq	Do IRQ routing for all PCI devices. This is normally done in pci_enable_
→ device(), → workaround → it.	skip_isa_align	[X86] do not align io start addr, handle more pci cards
→ so can → scanning. → boards which → config space → are disabled → work. → order.	noearly	[X86] Don't do any early type 1 This might help on some broken machine check when some devices' is read. But various workarounds and some IOMMU drivers will not
→ 4) kernels. → breadth-first → Payload Size) → MPS defaults. → largest value → root complex. → allowable MPS → MRRS (Max → supported → the device → performance. → 128B, which → support. This	bfsort	Sort PCI devices into breadth-first This sorting is done to get a device order compatible with older (<= 2).
	nobfsort	Don't sort PCI devices into order.
	pcie_bus_tune_off	Disable PCIe MPS (Max tuning and use the BIOS-configured
	pcie_bus_safe	Set every device's MPS to the supported by all devices below the
	pcie_bus_perf	Set device MPS to the largest based on its parent bus. Also set Read Request Size) to the largest value (no larger than the MPS that or bus can support) for best
	pcie_bus_peer2peer	Set every device's MPS to every device is guaranteed to configuration allows peer-to-peer

↳ DMA between any pair of devices, possibly at  
↳ the cost of reduced performance. This also  
↳ guarantees that hot-added devices will work.  
cbiosize=nn[KMG] The fixed amount of bus  
↳ space which is reserved for the CardBus bridge's  
↳ I/O window. The default value is 256 bytes.  
cbmemsize=nn[KMG] The fixed amount of bus  
↳ space which is reserved for the CardBus bridge's

See Documentation/admin-guide/md.rst.

ramdisk_size=  [RAM] Sizes of RAM disks in kilobytes
See Documentation/admin-guide/blockdev/
→ramdisk.rst.

ramdisk_start= [RAM] RAM disk image start address

random.trust_cpu={on,off}
    [KNL] Enable or disable trusting the use of →the
          CPU's random number generator (if →available) to
          fully seed the kernel's CRNG. Default is →controlled
          by CONFIG_RANDOM_TRUST_CPU.

random.trust_bootloader={on,off}
    [KNL] Enable or disable trusting the use of →a
          seed passed by the bootloader (if →available) to
          fully seed the kernel's CRNG. Default is →controlled
          by CONFIG_RANDOM_TRUST_BOOTLOADER.

ras=option[,option,...] [KNL] RAS-specific options

    cec_disable      [X86]
                      Disable the Correctable Errors →Collector,
                      see CONFIG_RAS_CEC help text.

    rcu_nocbs=       [KNL]
                      The argument is a cpu list, as described →above,
                      except that the string "all" can be used to
                      specify every CPU on the system.
```

↵ set In kernels built with CONFIG\_RCU\_NOCB\_CPU=y,  
 ↵ no-callback CPUs. the specified list of CPUs to be  
 ↵ will be Invocation of these CPUs' RCU callbacks  
 ↵ that offloaded to "rcuox/N" kthreads created for  
 ↵ and purpose, where "x" is "p" for RCU-preempt,  
 ↵ number. "s" for RCU-sched, and "N" is the CPU  
 ↵ CPUs, This reduces OS jitter on the offloaded  
 ↵ efficiency which can be useful for HPC and real-time  
                   workloads. It can also improve energy  
                   for asymmetric multiprocessors.

rcu\_nocb\_poll [KNL]  
 Rather than requiring that offloaded CPUs  
                   (specified by rcu\_nocbs= above) explicitly  
                   awaken the corresponding "rcuON" kthreads,  
                   make these kthreads poll for callbacks.  
                   This improves the real-time response for the  
                   offloaded CPUs by relieving them of the  
 ↵ need to wake up the corresponding kthread, but  
 ↵ degrades energy efficiency by requiring that the  
 ↵ kthreads periodically wake up to do the polling.

rcutree.blimit= [KNL]  
 Set maximum number of finished RCU  
 ↵ callbacks to process in one batch.

rcutree.dump\_tree= [KNL]  
 Dump the structure of the rcu\_node  
 ↵ combining tree out at early boot. This is used for  
 ↵ diagnostic purposes, to verify correct tree setup.

rcutree.gp\_cleanup\_delay= [KNL]  
 Set the number of jiffies to delay each  
 ↵ step of RCU grace-period cleanup.

rcutree.gp\_init\_delay= [KNL]

Set the number of jiffies to delay each step of RCU grace-period initialization.

`rcutree.gp_preinit_delay= [KNL]`  
Set the number of jiffies to delay each step of RCU grace-period pre-initialization, that is, changes up the propagation of recent CPU-hotplug changes up the rcu\_node combining tree.

`rcutree.use_softirq= [KNL]`  
If set to zero, move all RCU\_SOFTIRQ processing to non-zero default. Specify `rcutree.use_softirq=0` to use rcuc\_kthreads.

`rcutree.rcu_fanout_exact= [KNL]`  
Disable autobalancing of the rcu\_node combining tree. This is used by rcutorture, and might possibly be useful for architectures having high cache-to-cache transfer latencies.

`rcutree.rcu_fanout_leaf= [KNL]`  
Change the number of CPUs assigned to each leaf rcu\_node structure. Useful for very large systems, which will choose the value 64, and for NUMA systems with large remote-access latencies, which will choose a value aligned with the appropriate hardware boundaries.

`rcutree.rcu_min_cached_objs= [KNL]`  
Minimum number of objects which are cached and maintained per one CPU. Object size is equal to PAGE\_SIZE. The cache allows to reduce the pressure to page allocator, also it makes the whole algorithm to behave better in low memory condition.

```

rcutree.jiffies_till_first_fqs= [KNL]
    Set delay from grace-period initialization
→to
    first attempt to force quiescent states.
    Units are jiffies, minimum value is zero,
    and maximum value is HZ.

rcutree.jiffies_till_next_fqs= [KNL]
    Set delay between subsequent attempts to
→force
    quiescent states. Units are jiffies,
→minimum
    value is one, and maximum value is HZ.

rcutree.jiffies_till_sched_qs= [KNL]
    Set required age in jiffies for a
    given grace period before RCU starts
    soliciting quiescent-state help from
    rcu_note_context_switch() and cond_
→resched().
    If not specified, the kernel will calculate
    a value based on the most recent settings
    of rcutree.jiffies_till_first_fqs
    and rcutree.jiffies_till_next_fqs.
    This calculated value may be viewed in
    rcutree.jiffies_to_sched_qs. Any attempt
→to set
    rcutree.jiffies_to_sched_qs will be
→cheerfully
    overwritten.

rcutree.kthread_prio= [KNL,BOOT]
    Set the SCHED_FIFO priority of the RCU
→per-CPU
    kthreads (rcuc/N). This value is also used
→for
    the priority of the RCU boost threads (rcub/
→N)
    and for the RCU grace-period kthreads (rcu_
→bh,
    rcu_preempt, and rcu_sched). If RCU_BOOST is
    set, valid values are 1-99 and the default
→is 1
    (the least-favored priority). Otherwise,
→when
    RCU_BOOST is not set, valid values are 0-99
→and
    the default is zero (non-realtime
→operation).

```

```
rcutree.rcu_nocb_gp_stride= [KNL]
    Set the number of NOCB callback kthreads in
    each group, which defaults to the squareu
→root
    of the number of CPUs. Larger numbersu
→reduce
    the wakeup overhead on the globalu
→grace-period
    kthread, but increases that same overhead on
    each group's NOCB grace-period kthread.

rcutree.qhimark= [KNL]
    Set threshold of queued RCU callbacksu
→beyond which
    batch limiting is disabled.

rcutree.qlowmark= [KNL]
    Set threshold of queued RCU callbacks belowu
→which
    batch limiting is re-enabled.

rcutree.qovld= [KNL]
    Set threshold of queued RCU callbacksu
→beyond which
    RCU's force-quiescent-state scan willu
→aggressively
    enlist help from cond_resched() and schedu
→IPIs to
    help CPUs more quickly reach quiescentu
→states.
    Set to less than zero to make this be setu
→based
    on rcutree.qhimark at boot time and to zerou
→to
    disable more aggressive help enlistment.

rcutree.rcu_idle_gp_delay= [KNL]
    Set wakeup interval for idle CPUs that have
    RCU callbacks (RCU_FAST_NO_HZ=y).

rcutree.rcu_idle_lazy_gp_delay= [KNL]
    Set wakeup interval for idle CPUs that have
    only "lazy" RCU callbacks (RCU_FAST_NO_
→HZ=y).
    Lazy RCU callbacks are those which RCU can
    prove do nothing more than free memory.

rcutree.rcu_kick_kthreads= [KNL]
    Cause the grace-period kthread to get anu
→extra
    wake_up() if it sleeps three times longeru
```

→than  
 it should at force-quiescent-state time.  
 This wake\_up() will be accompanied by a  
 WARN\_ONCE() splat and an ftrace\_dump().

rcutree.rcu\_unlock\_delay= [KNL]  
 In CONFIG\_RCU\_STRICT\_GRACE\_PERIOD=y kernels,  
 this specifies an rcu\_read\_unlock()-timedelay  
 in microseconds. This defaults to zero.  
 Larger delays increase the probability of  
 catching RCU pointer leaks, that is, buggyuse  
 of RCU-protected pointers after the relevant  
 rcu\_read\_unlock() has completed.

rcutree.sysrq\_rcu= [KNL]  
 Commandeer a sysrq key to dump out TreeRCU's  
 rcu\_node tree with an eye towardsdetermining  
 why a new grace period has not yet started.

rcuscale\_gp\_async= [KNL]  
 Measure performance of asynchronous  
 grace-period primitives such as call\_rcu().

rcuscale\_gp\_async\_max= [KNL]  
 Specify the maximum number of outstanding  
 callbacks per writer thread. When a writer  
 thread exceeds this limit, it invokes the  
 corresponding flavor of rcu\_barrier() toallow  
 previously posted callbacks to drain.

rcuscale\_gp\_exp= [KNL]  
 Measure performance of expedited synchronous  
 grace-period primitives.

rcuscale\_holdoff= [KNL]  
 Set test-start holdoff period. The purposeof  
 this parameter is to delay the start of the  
 test until boot completes in order to avoid  
 interference.

rcuscale\_kfree\_rcu\_test= [KNL]  
 Set to measure performance of kfree\_rcu()flooding.

rcuscale\_kfree\_nthreads= [KNL]

The number of threads running loops of ↵  
↳ kfree\_rcu().

rcuscale.kfree\_alloc\_num= [KNL]  
↳ Number of allocations and frees done in an ↵  
↳ iteration.

rcuscale.kfree\_loops= [KNL]  
↳ Number of loops doing rcuscale.kfree\_alloc\_ ↵  
↳ num number  
↳ of allocations and frees.

rcuscale.nreaders= [KNL]  
↳ Set number of RCU readers. The value -1 ↵  
↳ selects  
↳ again  
↳ selects N  
↳ so on.  
↳ selects  
↳ A value of "n" less than or equal to -N ↵  
↳ a single reader.

rcuscale.nwriters= [KNL]  
↳ Set number of RCU writers. The values ↵  
↳ operate  
↳ the same as for rcuscale.nreaders.  
↳ N, where N is the number of CPUs

rcuscale.perf\_type= [KNL]  
↳ Specify the RCU implementation to test.

rcuscale.shutdown= [KNL]  
↳ Shut the system down after performance tests  
↳ complete. This is useful for hands-off ↵  
↳ automated  
↳ testing.

rcuscale.verbose= [KNL]  
↳ Enable additional printk() statements.

rcuscale.writer\_holdoff= [KNL]  
↳ Write-side holdoff between grace periods,  
↳ in microseconds. The default of zero says  
↳ no holdoff.

rcutorture.fqs\_duration= [KNL]  
↳ Set duration of force\_quiescent\_state bursts

```

        in microseconds.

rcutorture.fqs_holdoff= [KNL]
    Set holdoff time within force_quiescent_
→state bursts
    in microseconds.

rcutorture.fqs_stutter= [KNL]
    Set wait time between force_quiescent_state_
→bursts
    in seconds.

rcutorture.fwd_progress= [KNL]
    Enable RCU grace-period forward-progress_
→testing
    for the types of RCU supporting this notion.

rcutorture.fwd_progress_div= [KNL]
    Specify the fraction of a CPU-stall-warning
    period to do tight-loop forward-progress_
→testing.

rcutorture.fwd_progress_holdoff= [KNL]
    Number of seconds to wait between successive
    forward-progress tests.

rcutorture.fwd_progress_need_resched= [KNL]
    Enclose cond_resched() calls within checks_
→for
    need_resched() during tight-loop_
→forward-progress
    testing.

rcutorture.gp_cond= [KNL]
    Use conditional/asynchronous update-side
    primitives, if available.

rcutorture.gp_exp= [KNL]
    Use expedited update-side primitives, if_
→available.

rcutorture.gp_normal= [KNL]
    Use normal (non-expedited) asynchronous
    update-side primitives, if available.

rcutorture.gp_sync= [KNL]
    Use normal (non-expedited) synchronous
    update-side primitives, if available. If_
→all
    of rcutorture.gp_cond=, rcutorture.gp_exp=,
    rcutorture.gp_normal=, and rcutorture.gp_

```

```
→sync=
    are zero, rcutorture acts as if is 
→interpreted
    they are all non-zero.

rcutortureirqreader= [KNL]
    Run RCU readers from irq handlers, or, more
    accurately, from a timer handler. Not all 
→RCU
    flavors take kindly to this sort of thing.

rcutortureleakpointer= [KNL]
    Leak an RCU-protected pointer out of the 
→reader.
    This can of course result in splats, and is
    intended to test the ability of things like
    CONFIG_RCU_STRICT_GRACE_PERIOD=y to detect
    such leaks.

rcutorturen_barrier_cbs= [KNL]
    Set callbacks/threads for rcu_barrier() 
→testing.
    These just
        stress RCU, they don't participate in the 
→actual
        test, hence the "fake".

rcutorturenfakewriters= [KNL]
    Set number of concurrent RCU writers.  
→These just
    stress RCU, they don't participate in the 
→actual
    test, hence the "fake".

rcutorturenreaders= [KNL]
    Set number of RCU readers. The value -1 
→selects
    N-1, where N is the number of CPUs. A value
    "n" less than -1 selects N-n-2, where N is 
→again
    the number of CPUs. For example, -2 
→selects N
    (the number of CPUs), -3 selects N+1, and 
→so on.

rcutortureobject_debug= [KNL]
    Enable debug-object double-call_rcu() 
→testing.

rcutortureonoff_holdoff= [KNL]
    Set time (s) after boot for CPU-hotplug 
→testing.

rcutortureonoff_interval= [KNL]
    Set time (jiffies) between CPU-hotplug 
```

→operations,  
                   or zero to disable CPU-hotplug testing.

    rcutorture.read\_exit= [KNL]  
                   Set the number of read-then-exit kthreads.  
 ↵used  
                   to test the interaction of RCU updaters and  
                   task-exit processing.

    rcutorture.read\_exit\_burst= [KNL]  
                   The number of times in a given  
 ↵read-then-exit  
                   episode that a set of read-then-exit  
 ↵kthreads  
                   is spawned.

    rcutorture.read\_exit\_delay= [KNL]  
                   The delay, in seconds, between successive  
                   read-then-exit testing episodes.

    rcutorture.shuffle\_interval= [KNL]  
                   Set task-shuffle interval (s). Shuffling  
 ↵tasks  
                   allows some CPUs to go into dyntick-idle  
 ↵mode  
                   during the rcutorture test.

    rcutorture.shutdown\_secs= [KNL]  
                   Set time (s) after boot system shutdown.  
 ↵This  
                   is useful for hands-off automated testing.

    rcutorture.stall\_cpu= [KNL]  
                   Duration of CPU stall (s) to test RCU CPU  
 ↵stall  
                   warnings, zero to disable.

    rcutorture.stall\_cpu\_block= [KNL]  
                   Sleep while stalling if set. This will  
 ↵result  
                   in warnings from preemptible RCU in addition  
                   to any other stall-related activity.

    rcutorture.stall\_cpu\_holdoff= [KNL]  
                   Time to wait (s) after boot before inducing  
 ↵stall.

    rcutorture.stall\_cpu\_irqsoff= [KNL]  
                   Disable interrupts while stalling if set.

    rcutorture.stall\_gp\_kthread= [KNL]

Duration (s) of forced sleep within RCU grace-period kthread to test RCU CPU stall warnings, zero to disable. If both stall\_cpu and stall\_gp\_kthread are specified, the kthread is starved first, then the CPU.

rcutorture.stat\_interval= [KNL]  
Time (s) between statistics printk()s.

rcutorture.stutter= [KNL]  
Time (s) to stutter testing, for example, specifying five seconds, tests RCU's idle. This ability to transition abruptly to and from

rcutorture.test\_boost= [KNL]  
Test RCU priority boosting? 0=no, 1=maybe, 2=yes.  
"Maybe" means test if the RCU implementation under test support RCU priority boosting.

rcutorture.test\_boost\_duration= [KNL]  
Duration (s) of each individual boost test.

rcutorture.test\_boost\_interval= [KNL]  
Interval (s) between each boost test.

rcutorture.test\_no\_idle\_hz= [KNL]  
Test RCU's dyntick-idle handling. See also the rcutorture.shuffle\_interval parameter.

rcutorture.torture\_type= [KNL]  
Specify the RCU implementation to test.

rcutorture.verbose= [KNL]  
Enable additional printk() statements.

rcupdate.rcu\_cpu\_stall\_ftrace\_dump= [KNL]  
Dump ftrace buffer after reporting RCU CPU stall warning.

rcupdate.rcu\_cpu\_stall\_suppress= [KNL]  
Suppress RCU CPU stall warning messages.

rcupdate.rcu\_cpu\_stall\_suppress\_at\_boot= [KNL]

Suppress RCU CPU stall warning messages and rcutorture writer stall warnings that occur during early boot, that is, during the time before the init task is spawned.

`rcupdate.rcu_cpu_stall_timeout= [KNL]`  
 Set timeout for RCU CPU stall warning  
 ↪messages.

`rcupdate.rcu_expedited= [KNL]`  
 Use expedited grace-period primitives, for example, `synchronize_rcu_expedited()` instead of `synchronize_rcu()`. This reduces latency, but can increase CPU utilization, degrade real-time latency, and degrade energy  
 ↪efficiency.

No effect on CONFIG\_TINY\_RCU kernels.

`rcupdate.rcu_normal= [KNL]`  
 Use only normal grace-period primitives, for example, `synchronize_rcu()` instead of `synchronize_rcu_expedited()`. This improves real-time latency, CPU utilization, and energy efficiency, but can expose users to increased grace-period latency. This  
 ↪parameter  
 ↪overrides `rcupdate.rcu_expedited`. No  
 ↪effect on  
 CONFIG\_TINY\_RCU kernels.

`rcupdate.rcu_normal_after_boot= [KNL]`  
 Once boot has completed (that is, after `rcu_end_inkernel_boot()` has been invoked),  
 ↪use only normal grace-period primitives. No  
 ↪effect on CONFIG\_TINY\_RCU kernels.

`rcupdate.rcu_task_ipi_delay= [KNL]`  
 Set time in jiffies during which RCU tasks  
 ↪will avoid sending IPIs, starting with the  
 ↪beginning of a given grace period. Setting a large number avoids disturbing real-time  
 ↪workloads, but lengthens grace periods.

`rcupdate.rcu_task_stall_timeout= [KNL]`  
 Set timeout in jiffies for RCU task stall  
 ↪warning

messages. Disable with a value less than or equal to zero.

`rcupdate.rcu_self_test= [KNL]`  
Run the RCU early boot self tests

`rdinit= [KNL]`  
Format: <full\_path>  
Run specified binary instead of /init from the ramdisk, used for early userspace startup. See initrd.

`rdrand= [X86]`  
force - Override the decision by the kernel to hide the advertisement of RDRAND support (this affects certain AMD processors because of buggy BIOS support, specifically around the suspend/resume path).

`rdt= [HW,X86,RDT]`  
Turn on/off individual RDT features. List is: cmt, mbmtotal, mbmlocal, l3cat, l3cdp, mba. E.g. to turn on cmt and turn off mba use: `rdt=cmt,!mba`

`reboot= [KNL]`  
Format (x86 or x86\_64):  
[w[arm] | c[old] | h[ard] | s[oft] | g[pio]] \ [,]s[mp]#### \ [,]b[ios] | a[cpi] | k[bd] | t[riple] | e[fi] | p[ci]] \ [,]f[orce]  
Where reboot\_mode is one of warm (soft) or cold (hard) or gpio  
set mode for panic (prefix with 'panic\_' to reboot only), reboot\_type is one of bios, acpi, kbd, triple, efi, or pci, reboot\_force is either force or not specified,

reboot\_cpu is s[mp]#### with #####  
being the processor  
to be used for rebooting.

refscale.holdoff= [KNL]  
Set test-start holdoff period. The purpose  
of this parameter is to delay the start of the  
test until boot completes in order to avoid  
interference.

refscale.loops= [KNL]  
Set the number of loops over the  
synchronization primitive under test. Increasing this  
number reduces noise due to loop start/end,  
overhead, but the default has already reduced the  
per-pass noise to a handful of picoseconds on ca.  
2020 x86 laptops.

refscale.nreaders= [KNL]  
Set number of readers. The default value  
of -1 selects N, where N is roughly 75% of the  
number of CPUs. A value of zero is an interesting  
choice.

refscale.nruns= [KNL]  
Set number of runs, each of which is dumped  
onto the console log.

refscale.readdelay= [KNL]  
Set the read-side critical-section duration,  
measured in microseconds.

refscale.scale\_type= [KNL]  
Specify the read-protection implementation  
to test.

refscale.shutdown= [KNL]  
Shut down the system at the end of the  
performance test. This defaults to 1 (shut it down).  
when refscale is built into the kernel and to 0..

↳ (leave it running) when refscale is built as a module.

refscale.verbose= [KNL] Enable additional printk() statements.

relax\_domain\_level= [KNL, SMP] Set scheduler's default relax\_domain\_level. See Documentation/admin-guide/cgroup-v1/cpusets.rst.

reserve= [KNL,BUGS] Force kernel to ignore I/O ports or memory Format: <base1>,<size1>[,<base2>,<size2>,...]

]

won't use Reserve I/O ports or memory so the kernel won't use them. If <base> is less than 0x10000, the region is assumed to be I/O ports; otherwise it is memory.

reservetop= [X86-32] Format: nn[KMG] Reserves a hole at the top of the kernel virtual address space.

reservelow= [X86] Format: nn[K] Set the amount of memory to reserve for BIOS at the bottom of the address space.

reset\_devices [KNL] Force drivers to reset the underlying device during initialization.

resume= [SWSUSP] Specify the partition device for software suspend Format: {/dev/<dev> | PARTUUID=<uuid> | <int>:<int> | <hex>}

resume\_offset= [SWSUSP] Specify the offset from the beginning of the partition given by "resume=" at which the swap header

↳ is located,  
 ↳ files).  
 ↳ swsusp-and-swap-files.rst

↳ resumedelay= [HIBERNATION] Delay (in seconds) to pause  
 ↳ before attempting to  
 read the resume files

↳ resumewait [HIBERNATION] Wait (indefinitely) for  
 ↳ resume device to show up.  
 Useful for devices that are detected  
 ↳ asynchronously  
 (e.g. USB and MMC devices).

↳ hibernate= [HIBERNATION]  
 ↳ noresume Don't check if there's a  
 ↳ hibernation image present during boot.  
 ↳ nocompress Don't compress/decompress  
 ↳ hibernation images.  
 ↳ no Disable hibernation and resume.  
 ↳ protect\_image Turn on image protection during  
 ↳ restoration (that will set all pages holding  
 ↳ image data during restoration read-only).

retain\_initrd [RAM] Keep initrd memory after extraction

retbleed= [X86] Control mitigation of RETBleed  
 ↳ (Arbitrary  
 ↳ Instructions)  
 Speculative Code Execution with Return  
 vulnerability.

AMD-based UNRET and IBPB mitigations alone  
 ↳ do not stop sibling threads from influencing the  
 ↳ predictions of other sibling threads. For that reason, STIBP is  
 ↳ used on pro-cessors that support it, and mitigate SMT  
 ↳ on processors that don't.

off - no mitigation  
 auto - automatically select a  
 ↳ mitigation auto, nosmt - automatically select a

↳ mitigation,  
↳ for  
↳ Zen1  
↳ speculation  
↳ boundaries too.  
↳ It also  
↳ Not suitable  
↳ disable SMT  
↳ This is  
↳ which do not  
↳ return thunks,  
↳ f15h-f17h based  
↳ SMT when STIBP  
↳ the alternative for  
↳ STIBP.

↳ method at run

↳ retbleed=auto.

↳ rfckill.default\_state=  
    0       "airplane mode". All wifi, bluetooth,  
    ↳ wimax, gps, fm,  
                etc. communication is blocked by default.  
    1       Unblocked.

↳ rfckill.master\_switch\_mode=  
    0       The "airplane mode" button does nothing.  
    1       The "airplane mode" button toggles between  
    ↳ everything

↳ disabling SMT if necessary.  
↳ the full mitigation (only on  
    and older without STIBP).  
- On AMD, mitigate short  
    windows on basic block.  
Safe, highest perf impact.  
enables STIBP if present.  
on Intel.  
- Like "ibpb" above but will  
    when STIBP is not available.  
the alternative for systems  
have STIBP.  
- Force enable untrained  
    only effective on AMD  
systems.  
- Like unret, but will disable  
    is not available. This is  
systems which do not have

Selecting 'auto' will choose a mitigation  
time according to the CPU.

Not specifying this option is equivalent to

[KNL,ARM,CMA] Remoteproc physical memory  
↳ block.

Memory area to be used by remote processor  
↳ image,  
managed by CMA.

rw [KNL] Mount root device read-write on boot

S [KNL] Run init in single mode

s390\_iommu= [HW,S390]  
strict Set s390 IOTLB flushing mode  
With strict flushing every unmap operation  
will result in an IOTLB flush. Default is lazy flushing  
before reuse, which is faster.

sa1100ir [NET]  
See drivers/net/irda/sa1100\_ir.c.

sbni= [NET] Granch SBNI12 leased line adapter

sched\_debug [KNL] Enables verbose scheduler debug  
↳ messages.

schedstats= [KNL,X86] Enable or disable scheduled  
statistics.  
Allowed values are enable and disable. This  
feature incurs a small amount of overhead in the  
scheduler but is useful for debugging and performance  
tuning.

sched\_thermal\_decay\_shift= [KNL, SMP] Set a decay shift for scheduler  
thermal pressure signal. Thermal pressure signal  
follows the default decay period of other scheduler pelt  
signals(usually 32 ms but configurable).  
Setting sched\_thermal\_decay\_shift will left shift  
the decay period for the thermal pressure signal by  
the shift value.  
i.e. with the default pelt decay period of  
32 ms

```

    sched_thermal_decay_shift thermal_
→pressure decay pr
    1           64 ms
    2           128 ms
and so on.
Format: integer between 0 and 10
Default is 0.

scftorture.holdoff= [KNL]
    Number of seconds to hold off before_
→starting
    test. Defaults to zero for module_
→insertion and
    to 10 seconds for built-in smp_call_
→function()
    tests.

scftorture.longwait= [KNL]
    Request ridiculously long waits randomly_
→selected
    up to the chosen limit in seconds. Zero_
→(the
    default) disables this feature. Please note
→of
    that requesting even small non-zero numbers_
→warnings,
    seconds can result in RCU CPU stall_
→softlockup complaints, and so on.

scftorture.nthreads= [KNL]
    Number of kthreads to spawn to invoke the
    smp_call_function() family of functions.
    The default of -1 specifies a number of_
→kthreads
    equal to the number of CPUs.

scftorture.onoff_holdoff= [KNL]
    Number seconds to wait after the start of_
→the
    test before initiating CPU-hotplug_
→operations.

scftorture.onoff_interval= [KNL]
    Number seconds to wait between successive
    CPU-hotplug operations. Specifying zero_
→(which
    is the default) disables CPU-hotplug_
→operations.

scftorture.shutdown_secs= [KNL]
    The number of seconds following the start_

```

→ of the test after which to shut down the system. ↵

→ The default of zero avoids shutting down the system. ↵

→ Non-zero values are useful for automated tests. ↵

scftorture.stat\_interval= [KNL]  
The number of seconds between outputting the current test statistics to the console. A value of zero disables statistics output.

scftorture.stutter\_cpus= [KNL]  
The number of jiffies to wait between each change to the set of CPUs under test.

scftorture.use\_cpus\_read\_lock= [KNL]  
Use use\_cpus\_read\_lock() instead of the default preempt\_disable() to disable CPU hotplug while invoking one of the smp\_call\_function\*() functions.

scftorture.verbose= [KNL]  
Enable additional printk() statements.

scftorture.weight\_single= [KNL]  
The probability weighting to use for the smp\_call\_function\_single() function with a zero "wait" parameter. A value of -1 selects the default if all other weights are -1. ↵

→ However, if at least one weight has some other value, a value of -1 will instead select a weight of zero. ↵

scftorture.weight\_single\_wait= [KNL]  
The probability weighting to use for the smp\_call\_function\_single() function with a non-zero "wait" parameter. See weight\_single.

scftorture.weight\_many= [KNL]  
The probability weighting to use for the smp\_call\_function\_many() function with a

↳ zero  
 "wait" parameter. See weight\_single.  
 Note well that setting a high probability, for  
 this weighting can place serious IPI load  
 on the system.

scftorture.weight\_many\_wait= [KNL]  
 The probability weighting to use for the  
 smp\_call\_function\_many() function with a  
 non-zero "wait" parameter. See weight\_  
 ↳ single  
 and weight\_many.

scftorture.weight\_all= [KNL]  
 The probability weighting to use for the  
 smp\_call\_function\_all() function with a zero  
 "wait" parameter. See weight\_single and  
 weight\_many.

scftorture.weight\_all\_wait= [KNL]  
 The probability weighting to use for the  
 smp\_call\_function\_all() function with a  
 non-zero "wait" parameter. See weight\_  
 ↳ single  
 and weight\_many.

skew\_tick= [KNL] Offset the periodic timer tick per\_xtime\_lock contention on larger systems, and/or RCU lock contention on all systems with CONFIG\_MAXSMP set.  
 Format: { "0" | "1" }  
 0 -- disable. (may be 1 via CONFIG\_CMDLINE="skew\_tick=1"  
 1 -- enable.  
 Note: increases power consumption, thus enabled if running jitter sensitive (HPC/RT) workloads.

security= [SECURITY] Choose a legacy "major" security enable at boot. This has been deprecated by "lsm=" parameter.  
 ↳ module to the

selinux= [SELINUX] Disable or enable SELinux at boot.  
 ↳ time.  
 Format: { "0" | "1" }

See security/selinux/Kconfig help text.  
0 -- disable.  
1 -- enable.  
Default value is 1.

apparmor= [APPARMOR] Disable or enable AppArmor atboot time  
Format: { "0" | "1" }  
See security/apparmor/Kconfig help text  
0 -- disable.  
1 -- enable.  
Default value is set via kernel configoption.

serialnumber [BUGS=X86-32]

shapers= [NET]  
Maximal number of shapers.

simeth= [IA-64]  
simscsi=

slram= [HW,MTD]

slab\_nomerge [MM]  
Disable merging of slabs with similar size.  
May be  
distinguish  
hardened  
overflows and  
reduce  
single  
on their  
slub.rst.  
layout control by attackers can usually be frustrated by disabling merging. This willmost of the exposure of a heap attack to a cache (risks via metadata attacks are mostly unchanged). Debug options disable merging.  
For more information see Documentation/vm/  
own.  
slab\_max\_order= [MM, SLAB]  
Determines the maximum allowed order forslabs.  
A high setting may cause OOMs due to memory fragmentation. Defaults to 1 for systemswith

more than 32MB of RAM, 0 otherwise.

`slub_debug[=options[,slabs]][;[options[,slabs]]...]` [MM,  
↳ SLUB]

Enabling `slub_debug` allows one to determine  
↳ the culprit if slab objects become corrupted.  
↳ Enabling `slub_debug` can create guard zones around  
↳ objects and may poison objects when not in use. Also  
↳ tracks the last alloc / free. For more information see  
Documentation/vm/slub.rst.

`slub_memcg_sysfs=` [MM, SLUB]

Determines whether to enable sysfs  
directories for memory cgroup sub-caches. 1 to enable, 0 to  
disable. The default is determined by CONFIG\_SLUB\_  
MEMCG\_SYSFS\_ON. Enabling this can lead to a very high  
number of debug directories and files being created under  
`/sys/kernel/slub`.

`slub_max_order=` [MM, SLUB]

Determines the maximum allowed order for  
slabs. A high setting may cause OOMs due to memory  
fragmentation. For more information see  
Documentation/vm/slub.rst.

`slub_min_objects=` [MM, SLUB]

The minimum number of objects per slab.  
↳ SLUB will increase the slab order up to `slub_max_`  
order to generate a sufficiently large slab able to  
contain the number of objects indicated. The higher  
the number of objects the smaller the overhead of  
tracking slabs and the less frequently locks need to be  
acquired. For more information see Documentation/vm/  
`slub.rst`.

`slub_min_order=` [MM, SLUB]

Determines the minimum page order for slabs.  
→ Must be lower than `slub_max_order`.  
For more information see Documentation/vm/  
→ `slub.rst`.

`slub_nomerge` [MM, SLUB]  
Same with `slab_nomerge`. This is supported  
→ for legacy.  
See `slab_nomerge` for more information.

`smart2=` [HW]  
Format: `<iol>[,<io2>[,<...>,<i08>]]`

`smsc-ircc2.nopnp` [HW] Don't use PNP to discover SMC  
→ devices  
`smsc-ircc2.ircc_cfg=` [HW] Device configuration I/O port  
`smsc-ircc2.ircc_sir=` [HW] SIR base I/O port  
`smsc-ircc2.ircc_fir=` [HW] FIR base I/O port  
`smsc-ircc2.ircc_irq=` [HW] IRQ line  
`smsc-ircc2.ircc_dma=` [HW] DMA channel  
`smsc-ircc2.ircc_transceiver=` [HW] Transceiver type:  
→ pin select)  
0: Toshiba Satellite 1800 (GP data  
1: Fast pin select (default)  
2: ATC IRMode

`smt` [KNL,S390] Set the maximum number of  
→ threads (logical  
→ capable of  
→ capped to the  
actual hardware limit.  
Format: <integer>  
Default: -1 (no limit)

`softlockup_panic=` [KNL] Should the soft-lockup detector  
→ generate panics.  
Format: 0 | 1  
A value of 1 instructs the soft-lockup  
→ detector  
→ occurs. It is  
→ panic sysctl  
→ which is the  
respective build-time switch to that

↳ functionality.

```

softlockup_all_cpu_backtrace=
    [KNL] Should the soft-lockup detector
↳ generate
    backtraces on all cpus.
    Format: 0 | 1

sonypi.*=      [HW] Sony Programmable I/O Control Device
↳ driver
    See Documentation/admin-guide/laptops/
↳ sonypi.rst

spectre_v2=
    [X86] Control mitigation of Spectre variant
↳ 2
    (indirect branch speculation) vulnerability.
    The default operation protects the kernel
↳ from
    user space attacks.

    on  - unconditionally enable, implies
        spectre_v2_user=on
    off - unconditionally disable, implies
        spectre_v2_user=off
    auto - kernel detects whether your CPU
↳ model is
    vulnerable

    Selecting 'on' will, and 'auto' may, choose
↳ a
    mitigation method at run time according to
    the
    CPU, the available microcode, the setting
    of the
    CONFIG_RETPOLINE configuration option, and
    the
    compiler with which the kernel was built.

    Selecting 'on' will also enable the
    mitigation
    against user space to user space task
    attacks.

    Selecting 'off' will disable both the
    kernel and
    the user space protections.

    Specific mitigations can also be selected
    manually:

    retpoline      - replace indirect
```

```
→branches
    retpoline,generic - Retpolines
    retpoline,lfence  - LFENCE; indirect branch
    retpoline,amd     - alias for retpoline,
→lfence
    eibrs           - Enhanced/Auto IBRS
    eibrs,retpoline - Enhanced/Auto IBRS +_
→Retpolines
    eibrs,lfence    - Enhanced/Auto IBRS +_
→LFENCE
    ibrs           - use IBRS to protect_
→kernel

Not specifying this option is equivalent to
spectre_v2=auto.

spectre_v2_user=
    [X86] Control mitigation of Spectre variant_
→2
    (indirect branch speculation) vulnerability_
→between
    user space tasks

    on      - Unconditionally enable_
→mitigations. Is
    enforced by spectre_v2=on

    off     - Unconditionally disable_
→mitigations. Is
    enforced by spectre_v2=off

    prctl   - Indirect branch speculation is_
→enabled,
    but mitigation can be enabled via_
→prctl
    per thread. The mitigation_
→control state
    is inherited on fork.

    prctl,ibpb
        - Like "prctl" above, but only_
→STIBP is
    controlled per thread. IBPB is_
→issued
    always when switching between_
→different user
    space processes.

    seccomp
        - Same as "prctl" above, but all_
→seccomp
```

↳ mitigation unless threads will enable the ↳  
 they explicitly opt out.

↳ STIBP is seccomp,ibpb  
 ↳ issued - Like "seccomp" above, but only ↳  
 ↳ different controlled per thread. IBPB is ↳  
 ↳ depending on always when switching between ↳  
 ↳ vulnerability. user space processes.

auto - Kernel selects the mitigation ↳  
 the available CPU features and ↳

Default mitigation:  
 If CONFIG\_SECCOMP=y then "seccomp",  
 ↳ otherwise "prctl"

Not specifying this option is equivalent to spectre\_v2\_user=auto.

spec\_rstack\_overflow=  
 ↳ AMD Zen CPUs [X86] Control RAS overflow mitigation on ↳

mitigation only off - Disable mitigation  
 mitigation (default) microcode - Enable microcode ↳

 (cloud-specific ↳

spec\_store\_bypass\_disable=  
 ↳ Disable mitigation [HW] Control Speculative Store Bypass (SSB)  
 (Speculative Store Bypass vulnerability)

against a Certain CPUs are vulnerable to an exploit ↳  
 optimization known a common industry wide performance ↳  
 as "Speculative Store Bypass" in which ↳

→ recent stores to the same memory location may not be observed by later loads during speculative execution.  
→ The idea is that such stores are unlikely and that they can be detected prior to instruction retirement at the end of a particular speculation execution.  
→ window.

→ forwarded In vulnerable processors, the speculatively store can be used in a cache side channel  
→ attack, for example to read memory to which the attacker does not directly have access (e.g. inside sandboxed code).

→ Speculative Store This parameter controls whether the Bypass optimization is used.

On x86 the options are:

→ Speculative Store Bypass	on	- Unconditionally disable
→ Speculative Store Bypass	off	- Unconditionally enable
→ model contains an	auto	- Kernel detects whether the CPU implementation of Speculative
→ Store Bypass and		picks the most appropriate
→ mitigation. If the		CPU is not vulnerable, "off" is
→ selected. If the		CPU is vulnerable the default
→ mitigation is		architecture and Kconfig
→ dependent. See below.	prctl	- Control Speculative Store Bypass via prctl. Speculative Store for a process by default. The
→ per thread		is inherited on fork.
→ Bypass is enabled	seccomp	- Same as "prctl" above, but all
→ state of the control		

↵`seccomp threads` will disable SSB unless they  
 ↵`explicitly opt out.`

↵`otherwise "prctl"`

Default mitigations:  
 X86: If `CONFIG_SECCOMP=y` "seccomp",  
 ↵`store-forwarding`

On powerpc the options are:  
 ↵`on,auto` - On Power8 and Power9 insert a barrier on kernel entry and exit.  
 ↵`On Power7` perform a software flush on exit.  
 ↵`kernel entry and exit.`  
 ↵`off` - No action.

Not specifying this option is equivalent to `spec_store_bypass_disable=auto`.

```

Set the STI (builtin display/keyboard on machines) console (graphic card) which as the initial boot-console.  
See also comment in drivers/video/console/sticore.c.

sti\_font= [HW]  
See comment in drivers/video/console/sticore.c.

stifb= [HW]  
Format: bpp:<bpp1>[:<bpp2>[:<bpp3>...]]

sunrpc.min\_resvport=  
sunrpc.max\_resvport= [NFS,SUNRPC]  
SunRPC servers often require that client requests originate from a privileged port (i.e. a range 0 < portnr < 1024). An administrator who wishes to reserve some ports for other uses may adjust the range kernel's sunrpc client considers to be using these two parameters to set the maximum port values.

sunrpc.svc\_rpc\_per\_connection\_limit= [NFS,SUNRPC]  
Limit the number of requests that the server will process in parallel from a single connection. The default value is 0 (no limit).

sunrpc.pool\_mode= [NFS]

→ CPUs to  
 → many NICs  
 → bound, this  
 → serving.  
 → while the  
 → appropriate mode  
 → all CPUs  
 → (equivalent  
 → simultaneous  
 → to a  
 → you to  
 → the  
 → client.

Control how the NFS server code allocates service thread pools. Depending on how you have and where their interrupts are option will affect which CPUs will do NFS.

Note: this parameter cannot be changed while the NFS server is running.

auto	the server chooses an automatically using heuristics
global	a single global pool contains
percpu	one pool for each CPU
pernode	one pool for each NUMA node to global on non-NUMA machines)

```
sunrpc.tcp_slot_table_entries=
sunrpc.udp_slot_table_entries=
[NFS,SUNRPC]
Sets the upper limit on the number of RPC calls that can be sent from the client server. Increasing these values may allow improve throughput, but will also increase amount of memory reserved for use by the client.
```

suspend.pm\_test\_delay=
[SUSPEND]
Sets the number of seconds to remain in a mode before resuming the system (see /sys/power/pm\_test). Only available when CONFIG\_PM\_DEBUG is set. Default value is 5.

svm=
[PPC]
Format: { on | off | y | n | 1 | 0 }
This parameter controls use of the Protected Execution Facility on pSeries.

swapaccount=[0|1]

```
        [KNL] Enable accounting of swap in memory.  
↳resource  
        controller if no parameter or 1 is given or  
↳disable  
        it if 0 is given (See Documentation/  
↳admin-guide/cgroup-v1/memory.rst)  
  
        swiotlb=  
        [ARM,IA-64,PPC,MIPS,X86]  
        Format: { <int> | force | noforce }  
        <int> -- Number of I/O TLB slabs  
        force -- force using of bounce buffers even  
↳if they  
        wouldn't be automatically used by  
↳the kernel  
        noforce -- Never use bounce buffers (for  
↳debugging)  
  
        switches=[HW,M68k]  
  
        sysctl.*=  
        [KNL]  
        Set a sysctl parameter, right before  
↳loading the init  
        process, as if the value was written to the  
        respective  
        /proc/sys/... file. Both '.' and '/' are  
        recognized as  
        separators. Unrecognized parameters and  
        invalid values  
        are reported in the kernel log. Sysctls  
        registered  
        later by a loaded module cannot be set this  
        way.  
        Example: sysctl.vm.swappiness=40  
  
        sysfs.deprecated=0|1 [KNL]  
        Enable/disable old style sysfs layout for  
↳old udev  
        on older distributions. When this option is  
↳enabled  
        very new udev will not work anymore. When  
↳this option  
        is disabled (or CONFIG_SYSFS_DEPRECATED not  
↳compiled)  
        in older udev will not work anymore.  
        Default depends on CONFIG_SYSFS_DEPRECATED_  
↳V2 set in  
        the kernel configuration.  
  
        sysrq_always_enabled  
        [KNL]  
        Ignore sysrq setting - this boot parameter
```

```

→ will          neutralize any effect of /proc/sys/kernel/
→ sysrq.        Useful for debugging.

tcpmhash_entries= [KNL,NET]
                  Set the number of tcp_metrics_hash slots.
                  Default value is 8192 or 16384 depending on
→ total
→ metrics
→ ip-sysctl.rst
→ details.

→points to this
    value

thermal.tzp=      [HW,ACPI]
    Specify global default ACPI thermal zoneu
→polling rate
    <deci-seconds>: poll all this frequency
    0: no polling (default)

threadirqs         [KNL]
    Force threading of all interrupt handlersu
→except those
    marked explicitly IRQF_NO_THREAD.

topology=          [S390]
    Format: {off | on}
    Specify if the kernel should make use ofu
→the cpu
    topology information if the hardwareu
→supports this.
    The scheduler will make use of thisu
→information and
    e.g. base its process migration decisionsu
→on it.
    Default is on.

topology_updates= [KNL, PPC, NUMA]
    Format: {off}
    Specify if the kernel should ignore (off)
    topology updates sent by the hypervisor tou
→this
    LPAR.

torture.disable_onoff_at_boot= [KNL]
    Prevent the CPU-hotplug component ofu
→torturing
    until after init has spawned.

torture.ftrace_dump_at_shutdown= [KNL]
    Dump the ftrace buffer at torture-testu
→shutdown,
    even if there were no errors. This can be a
→tests
    very costly operation when many tortureu
→systems
    are running concurrently, especially onu
```

with rotating-rust storage.

`tp720= [HW,PS2]`

`tpm_suspend_pcr=[HW,TPM]`

Format: integer pcr id

Specify that at suspend time, the tpm driver should extend the specified pcr with zeros, as a workaround for some chips which fail to flush the last written pcr on TPM\_SaveState. This will guarantee that all the other pcrs are saved.

`trace_buf_size=nn[KMG]`

[FTRACE] will set tracing buffer size on

each cpu.

`trace_event=[event-list]`

[FTRACE] Set and start specified trace

events in order

to facilitate early boot debugging. The

event-list is a

comma separated list of trace events to

enable. See

also Documentation/trace/events.rst

`trace_options=[option-list]`

[FTRACE] Enable or disable tracer options

at boot.

The option-list is a comma delimited list

of options

that can be enabled or disabled just as if

you were

to echo the option name into

`/sys/kernel/debug/tracing/trace_options`

For example, to enable stacktrace option

(to dump the

stack trace of each event), add to the

command line:

`trace_options=stacktrace`

See also Documentation/trace/ftrace.rst

"trace options"

section.

`tp_printk[FTRACE]`

Have the tracepoints sent to printk as well

as the

↳ early boot up  
↳ not give the  
↳ performing a

↳ printk,  
↳ no effect.

↳ activating high  
↳ can cause

↳ tracing when a  
↳ Tracing can  
↳ "tracing\_on"  
  
↳ trace before  
↳ the trace to  
↳ warning output.  
  
↳ the sysctl

↳ of the system  
↳ rst

tracing ring buffer. This is useful for  
where the system hangs or reboots and does  
option for reading the tracing buffer or  
ftrace\_dump\_on\_oops.

To turn off having tracepoints sent to  
echo 0 > /proc/sys/kernel/tracepoint\_printk  
Note, echoing 1 into this file without the  
tracepoint\_printk kernel cmdline option has

\*\* CAUTION \*\*

Having tracepoints sent to printk() and  
frequency tracepoints such as irq or sched,  
the system to live lock.

traceoff\_on\_warning  
[FTRACE] enable this option to disable  
warning is hit. This turns off "tracing\_on".  
be enabled again by echoing '1' into the  
file located in /sys/kernel/debug/tracing/

This option is useful, as it disables the  
the WARNING dump is called, which prevents  
be filled with content caused by the

This option can also be set at run time via  
option: kernel/traceoff\_on\_warning

transparent\_hugepage=  
[KNL]  
Format: [always|madvise|never]  
Can be used to control the default behavior  
with respect to transparent hugepages.  
See Documentation/admin-guide/mm/transhuge.

	for more details.
tsc=	Disable clocksource stability checks for TSC.
↳ reliable, this runtime, as well	Format: <string> [x86] reliable: mark tsc clocksource as
↳ Used to enable hardware, and in accounting.	disables clocksource verification at as the stability checks done at bootup.
↳ ACCOUNTING on any accounting	high-resolution timer mode on older virtualized environment. [x86] noirqtime: Do not use TSC to do irq
↳ unstable, this bootup and watchdog notices.	Used to run time disable IRQ_TIME_ platforms where RDTSC is slow and this can add overhead. [x86] unstable: mark the TSC clocksource as
↳ watchdog. Used requirements (where not	marks the TSC unconditionally unstable at avoids any further wobbles once the TSC [x86] nowatchdog: disable clocksource in situations with strict latency interruptions from clocksource watchdog are acceptable).
tsc_early_khz=	[X86] Skip early TSC calibration and use the given value instead. Useful when the early TSC procedure is not reliable, such as on with CPUID.16h support and partial CPUID.
↳ frequency discovery	Format: <unsigned int>

                                         whether the medium is write-protected).
                                         y = ALWAYS_SYNC (issue a u
                                         SYNCHRONIZE_CACHE even if the device claims u
                                         no cache,
                                         not on uas)
Example: quirks=0419:aaf5:rl,0421:0433:rc

```

```
user_debug= [KNL,ARM]
Format: <int>
See arch/arm/Kconfig.debug help text.
    1 - undefined instruction events
    2 - system calls
    4 - invalid data aborts
    8 - SIGSEGV faults
   16 - SIGBUS faults
Example: user_debug=31

userpte=
[X86] Flags controlling user PTE
↳ allocations.

    nohigh = do not allocate PTE pages
↳ in
    HIGHMEM regardless of
↳ setting
    of CONFIG_HIGHPTE.

vdso= [X86,SH]
On X86_32, this is an alias for vdso32=.
↳ Otherwise:
    vdso=1: enable VDSO (the default)
    vdso=0: disable VDSO mapping

vdso32= [X86] Control the 32-bit vDSO
    vdso32=1: enable 32-bit VDSO
    vdso32=0 or vdso32=2: disable 32-bit VDSO

    See the help text for CONFIG_COMPAT_VDSO
    ↳ for more
    ↳ details. If CONFIG_COMPAT_VDSO is set, the
    ↳ vdso32=0; otherwise, the default is
    ↳ vdso32=1.

    ↳ vdso32=2 is an
    ↳ For compatibility with older kernels,
    ↳ alias for vdso32=0.

    ↳ says:
        Try vdso32=0 if you encounter an error that
        ↳ dl_main: Assertion `(void *) ph->p_vaddr ==
        ↳ _rtld_local._dl_sysinfo_dso' failed!

vector= [IA-64,SMP]
vector=percpu: enable percpu vector domain
```

video= [FB] Frame buffer configuration  
 See Documentation/fb/modedb.rst.

video.brightness\_switch\_enabled= [0,1]  
 If set to 1, on receiving an ACPI notify, generated by hotkey, video driver will level and then send out the event to user, the allocated input device; If set to 0, will only send out the event without brightness level.  
 default: 1

virtio\_mmio.device= [VMMIO] Memory mapped virtio (platform) device.

where:  
 <size>@<baseaddr>:<irq>[:<id>]  
 <size> := size (can use like K, M and G)  
 <baseaddr> := physical base address  
 <irq> := interrupt number (as request\_irq())  
 <id> := (optional) platform

example:  
 virtio\_mmio.device=1K@0x100b0000:48:7

Can be used multiple times for multiple devices.

vga= [B00T,X86-32] Select a particular video mode  
 See Documentation/x86/boot.rst and Documentation/admin-guide/svga.rst.  
 Use vga=ask for menu.  
 This is actually a boot loader parameter; the value is passed to the kernel using a special protocol.

vm\_debug[=options] [KNL] Available with CONFIG\_DEBUG\_VM=y.  
 May slow down system boot speed, especially when

enabled on systems with a large amount of memory.

All options are enabled by default, and this interface is meant to allow for selectively enabling or disabling specific virtual memory debugging features.

Available options are:

- P Enable page structure init time
- Disable all of the above options

vmalloc=nn[KMG] [KNL,B00T] Forces the vmalloc area to have an exact size of <nn>. This can be used to increase minimum size (128MB on x86). It can also be decrease the size and leave more room for mapped kernel RAM.

vmcp\_cma=nn[MG] [KNL,S390]  
↳ contiguous memory Sets the memory size reserved for allocations for the vmcp device driver.

vhalt=  
↳ system halt. [KNL,S390] Perform z/VM CP command after Format: <command>

vpanic=  
↳ kernel panic. [KNL,S390] Perform z/VM CP command after Format: <command>

vmpoff=  
↳ power off. [KNL,S390] Perform z/VM CP command after Format: <command>

vsyscall=  
↳ calls to [X86-64]  
↳ legacy Controls the behavior of vsyscalls (i.e. fixed addresses of 0xffffffffffff600x00 from code). Most statically-linked binaries and versions of glibc use these calls. Because functions are at fixed addresses, they make

	targets for exploits that can control RIP.
↳ traps and are	emulate [default] Vsyscalls turn into emulated reasonably safely.
↳ The vsyscall	page is readable.
↳ are	xonly Vsyscalls turn into traps and emulated reasonably safely.
↳ The vsyscall	page is not readable.
↳ This makes	none Vsyscalls don't work at all.
↳ exploits but	them quite hard to use for might break your system.
vt.color=	[VT] Default text color. Format: 0xYX, X = foreground, Y = background. Default: 0x07 = light gray on black.
vt.cur_default=	[VT] Default cursor shape. Format: 0xCCBAA, where AA, BB, and CC are the parameters of the <Esc>[?A;B;Cc escape sequence; see VGA-softcursor.txt. Default: 2 = underline.
vt.default_blu=	[VT] Format: <blue0>,<blue1>,<blue2>,...,<blue15> Change the default blue palette of the console. This is a 16-member array composed of values ranging from 0-255.
vt.default_grn=	[VT] Format: <green0>,<green1>,<green2>,..., <green15> Change the default green palette of the console. This is a 16-member array composed of values ranging from 0-255.
vt.default_red=	[VT] Format: <red0>,<red1>,<red2>,...,<red15> Change the default red palette of the

↳ console.

This is a 16-member array composed of values ranging from 0-255.

vt.default\_utf8=

[VT]

Format=<0|1>

Set system-wide default UTF-8 mode for all ↳ ttys.

Default is 1, i.e. UTF-8 mode is enabled ↳ for all

newly opened terminals.

vt.global\_cursor\_default=

[VT]

Format=<-1|0|1>

Set system-wide default for whether a cursor is shown on new VTs. Default is -1, i.e. cursors will be created by default ↳ unless

overridden by individual drivers. 0 will ↳ hide

cursors, 1 will display them.

vt.italic=

[VT] Default color for italic text; 0-15.

Default: 2 = green.

vt.underline=

[VT] Default color for underlined text; ↳ 0-15.

Default: 3 = cyan.

watchdog timers [HW,WDT]

For information on watchdog timers,

see Documentation/watchdog/ ↳ watchdog-parameters.rst

or other driver-specific files in the Documentation/watchdog/ directory.

watchdog\_thresh=

[KNL]

Set the hard lockup detector stall duration threshold in seconds. The soft lockup ↳ detector

threshold is set to twice the value. A ↳ value of 0

disables both lockup detectors. Default is ↳ 10

seconds.

workqueue.watchdog\_thresh=

If CONFIG\_WQ\_WATCHDOG is configured, ↳ workqueue can

↵state to warn stall conditions and dump internal[link](#)  
 ↵threshold help debugging. 0 disables workqueue stall detection; otherwise, it's the stall[link](#)  
 ↵30 and duration in seconds. The default value is[link](#)  
 ↵the it can be updated at runtime by writing to[link](#)  
 corresponding sysfs file.

↵workqueue.disable\_numa By default, all work items queued to unbound workqueues are affine to the NUMA nodes[link](#)  
 ↵they're issued on, which results in better behavior[link](#)  
 ↵in general. If NUMA affinity needs to be[link](#)  
 ↵disabled for whatever reason, this option can be used.[link](#)  
 ↵Note that this also can be controlled[link](#)  
 ↵per-workqueue for workqueues visible under /sys/bus/workqueue/  
 ↵.

↵workqueue.power\_efficient Per-cpu workqueues are generally preferred[link](#)  
 ↵because they show better performance thanks to cache locality; unfortunately, per-cpu workqueues[link](#)  
 ↵tend to be more power hungry than unbound[link](#)  
 ↵workqueues.

↵which Enabling this makes the per-cpu workqueues[link](#)  
 ↵to power were observed to contribute significantly[link](#)  
 ↵lower consumption unbound, leading to measurably[link](#)  
 ↵determined by power usage at the cost of small performance overhead.

↵determined by The default value of this parameter is[link](#)  
 ↵DEFAULT. the config option CONFIG\_WQ\_POWER\_EFFICIENT\_

↵workqueue.debug\_force\_rr\_cpu Workqueue used to implicitly guarantee that[link](#)

↳ work items queued without explicit CPU specified  
↳ are put on the local CPU. This guarantee is no  
↳ longer true and while local CPU is still preferred work  
↳ items may be put on foreign CPUs. This debug  
↳ option forces round-robin CPU selection to flush  
↳ out usages which depend on the now broken  
↳ guarantee. When enabled, memory and cache locality  
↳ will be impacted.

x2apic\_phys [X86-64,APIC] Use x2apic physical mode  
↳ instead of default x2apic cluster mode on platforms supporting x2apic.

x86\_intel\_mid\_timer= [X86-32,APBT]  
Choose timer option for x86 Intel MID  
↳ platform. Two valid options are apbt timer only and  
↳ lapic timer plus one apbt timer for broadcast timer.  
x86\_intel\_mid\_timer=apbt\_only | lapic\_and\_  
↳ apbt

xen\_512gb\_limit [KNL,X86-64,XEN]  
Restricts the kernel running  
↳ paravirtualized under Xen to use only up to 512 GB of RAM. The reason  
↳ to do so is crash analysis tools and Xen tools for  
↳ doing domain save/restore/migration must be enabled to  
↳ handle larger domains.

xen\_emul\_unplug= [HW,X86,XEN]  
Unplug Xen emulated devices  
Format: [unplug0,][unplug1]  
ide-disks -- unplug primary master IDE  
↳ devices aux-ide-disks -- unplug non-primary-master  
↳ IDE devices nics -- unplug network devices  
all -- unplug all emulated devices (NICs)

→and IDE disks)  
 →is unnecessary -- unplugging emulated devices.  
 →not respond to unnecessary even if the host did.  
 →check succeeds the unplug protocol never -- do not unplug even if version.  
 →executing late xen\_legacy\_crash [X86,XEN] Crash from Xen panic notifier, without panic() code such as dumping handler.  
 →PV optimizations. xen\_nopvspin [X86,XEN] Disables the qspinlock slowpath using Xen. This parameter is obsoleted by "nopvspin" has equivalent effect for XEN platform.  
 →parameter, which xen\_nopv [X86] Disables the PV optimizations forcing the run as generic HVM guest with no PV drivers. This option is obsoleted by the "nopv" has equivalent effect for XEN platform.  
 →option, which xen\_no\_vector\_callback [KNL,X86,XEN] Disable the vector callback for Xen event channel interrupts.  
 →before giving them back xen\_scrub\_pages= [XEN] Boolean option to control scrubbing pages to Xen, for use by other domains. Can be also changed at runtime with /sys/devices/system/xen\_memory/xen\_memory0/scrub\_pages. Default value controlled with CONFIG\_XEN\_SCRUB\_PAGES\_DEFAULT.  
 →virtual Xen xen\_timer\_slop= [X86-64,XEN] Set the timer slop (in nanoseconds) for the timers (default is 100000). This adjusts delta of virtualized Xen timers, where lower values

improve timer resolution at the expense of processing more timer interrupts.

xen.balloon\_boot\_timeout= [XEN]  
The time (in seconds) to wait before giving up to boot in case initial ballooning fails to free enough memory.

Applies only when running as HVM or PVH started with less memory configured than allowed at max. Default is 180.

xen.event\_eoi\_delay= [XEN]  
How long to delay EOI handling in case of event storms (jiffies). Default is 10.

xen.event\_loop\_timeout= [XEN]  
After which time (jiffies) the event handling loop should start to delay EOI handling. Default is 2.

xen fifo\_events= [XEN]  
Boolean parameter to disable using fifo event handling even if available. Normally fifo event handling is preferred over the 2-level event handling, fairer and the number of possible events is much higher. Default is on (use fifo).

nopv= [X86,XEN,KVM,HYPER\_V,VMWARE]  
Disables the PV optimizations forcing the guest to run as generic guest with no PV drivers.

Currently support XEN HVM, KVM, HYPER\_V and VMWARE guest.

nopvspin [X86,XEN,KVM]  
Disables the qspinlock slow path using PV optimizations which allow the hypervisor to 'idle' the guest on lock contention.

xirc2ps_cs=	[NET,PCMCIA]
	Format:
	<irq>,<irq_mask>,<io>,<full_duplex>,<do_sound>,<lockup_hack>[,<irq2>[,<irq3>[,<irq4>]]]
xive=	[PPC]
↳ will	By default on POWER9 and above, the kernel will natively use the XIVE interrupt controller.
↳ This option allows the fallback firmware mode to be used:	
↳ XIVE interrupt	off Fallback to firmware control of controller on both pseries and platforms. Only useful on POWER9 and above.
↳ powernv	
↳ and above.	
xhci-hcd.quirks	[USB,KNL]
↳ supplemental xhci	A hex value specifying bitmask with host controller quirks. Meaning of each bit consulted in header drivers/usb/host/xhci.h.
xmon	[PPC]
↳ Default is off.	Format: { early   on   rw   ro   off } Controls if xmon debugger is enabled.
↳ "xmon=early".	Passing only "xmon" is equivalent to
↳ boot; xmon	early Call xmon as early as possible on debugger is called from setup_
↳ arch().	on xmon debugger hooks will be
↳ installed so xmon	is only called on a kernel crash.
↳ Default mode,	i.e. either "ro" or "rw" mode, is
↳ controlled	with CONFIG_XMON_DEFAULT_RO_MODE.
↳ installed so xmon	xmon debugger hooks will be
↳ mode is write,	is called only on a kernel crash,
↳ other data	meaning SPR registers, memory and,

can be written using xmon commands.  
ro same as "rw" option above but SPRu  
registers,  
written using  
off memory, and other data can't beu  
xmon commands.  
xmon is disabled.

## 2.2 Todo

Add more DRM drivers.

## LINUX ALLOCATED DEVICES (4.X+ VERSION)

This list is the Linux Device List, the official registry of allocated device numbers and /dev directory nodes for the Linux operating system.

The LaTeX version of this document is no longer maintained, nor is the document that used to reside at lanana.org. This version in the mainline Linux kernel is the master document. Updates shall be sent as patches to the kernel maintainers (see the Documentation/process/submitting-patches.rst document). Specifically explore the sections titled “CHAR and MISC DRIVERS”, and “BLOCK LAYER” in the MAINTAINERS file to find the right maintainers to involve for character and block devices.

This document is included by reference into the Filesystem Hierarchy Standard (FHS). The FHS is available from <https://www.pathname.com/fhs/>.

Allocations marked (68k/Amiga) apply to Linux/68k on the Amiga platform only. Allocations marked (68k/Atari) apply to Linux/68k on the Atari platform only.

This document is in the public domain. The authors requests, however, that semantically altered versions are not distributed without permission of the authors, assuming the authors can be contacted without an unreasonable effort.

**Attention:** DEVICE DRIVERS AUTHORS PLEASE READ THIS

Linux now has extensive support for dynamic allocation of device numbering and can use sysfs and udev (systemd) to handle the naming needs. There are still some exceptions in the serial and boot device area. Before asking for a device number make sure you actually need one.

To have a major number allocated, or a minor number in situations where that applies (e.g. busmice), please submit a patch and send to the authors as indicated above.

Keep the description of the device *in the same format as this list*. The reason for this is that it is the only way we have found to ensure we have all the requisite information to publish your device and avoid conflicts.

Finally, sometimes we have to play “namespace police.” Please don’t be offended. We often get submissions for /dev names that would be bound to cause conflicts down the road. We are trying to avoid getting in a situation where we would have to suffer an incompatible forward change. Therefore, please consult with us **before** you make your device names and numbers in any way public, at least to the point where it would be at all difficult to get them changed.

Your cooperation is appreciated.

0	Unnamed devices (e.g. non-device mounts) 0 = reserved as null device number See block major 144, 145, 146 for expansion areas.	
1 char	<b>Memory devices</b> 1 = /dev/mem Physical memory access 2 = /dev/kmem Kernel virtual memory access 3 = /dev/null Null device 4 = /dev/port I/O port access 5 = /dev/zero Null byte source 6 = /dev/core OBSOLETE - replaced by /	
↳ proc/kcore	7 = /dev/full Returns ENOSPC on write 8 = /dev/random Nondeterministic random	
↳ number gen.	9 = /dev/urandom Faster, less secure random	
↳ number gen.	10 = /dev/aio Asynchronous I/O	
↳ notification interface	11 = /dev/kmsg Writes to this come out as	
↳ printk's, reads	export the buffered printk	
↳ records.	12 = /dev/oldmem OBSOLETE - replaced by /	
↳ proc/vmcore		
1 block	<b>RAM disk</b> 0 = /dev/ram0 First RAM disk 1 = /dev/ram1 Second RAM disk ... 250 = /dev/initrd Initial RAM disk	
	Older kernels had /dev/ramdisk (1, 1) here. /dev/initrd refers to a RAM disk which was preloaded by the boot loader; newer kernels use /dev/ram0 for the initrd.	
2 char	<b>Pseudo-TTY masters</b> 0 = /dev/ptyp0 First PTY master 1 = /dev/ptyp1 Second PTY master ... 255 = /dev/ptyef 256th PTY master	
	Pseudo-tty's are named as follows: * Masters are "pty", slaves are "tty"; * the fourth letter is one of pqrsuvwxyzabcde	
↳ indicating	the 1st through 16th series of 16 pseudo-ttys	

→ each, and  
→ indicating \* the fifth letter is one of 0123456789abcdefu  
the position within the series.

These are the old-style (BSD) PTY devices; Unix98 devices are on major 128 and above and use the PTY master multiplex (/dev/ptmx) to acquire a PTY on demand.

2 block	Floppy disks	
→ autodetect	0 = /dev/fd0	Controller 0, drive 0, <u>u</u>
→ autodetect	1 = /dev/fd1	Controller 0, drive 1, <u>u</u>
→ autodetect	2 = /dev/fd2	Controller 0, drive 2, <u>u</u>
→ autodetect	3 = /dev/fd3	Controller 0, drive 3, <u>u</u>
→ autodetect	128 = /dev/fd4	Controller 1, drive 0, <u>u</u>
→ autodetect	129 = /dev/fd5	Controller 1, drive 1, <u>u</u>
→ autodetect	130 = /dev/fd6	Controller 1, drive 2, <u>u</u>
→ autodetect	131 = /dev/fd7	Controller 1, drive 3, <u>u</u>
→ number:	To specify format, add to the autodetect device <u>u</u>	
→ drive(1)	0 = /dev/fd?	Autodetect format
→ drive(1)	4 = /dev/fd?d360	5.25" 360K in a 360K <u>u</u>

↪ drive only				
	NOTE: The letter in the device name (d, q, h or u)			
	signifies the type of drive: 5.25" Double Density			✉
↪ (d),				
↪ 5"	5.25" Quad Density (q), 5.25" High Density (h) or 3.			
	(any model, u). The use of the capital letters D, H			
	and E for the 3.5" models have been deprecated,			✉
↪ since	the drive type is insignificant for these devices.			
3 char	Pseudo-TTY slaves			
	0 = /dev/ttyp0		First PTY slave	
	1 = /dev/ttyp1		Second PTY slave	
	...			
	255 = /dev/ttyef		256th PTY slave	
	These are the old-style (BSD) PTY devices; Unix98			
	devices are on major 136 and above.			

3 block ↳ CD-ROM) ↳ CD-ROM)	First MFM, RLL and IDE hard disk/CD-ROM interface 0 = /dev/hda 64 = /dev/hdb	Master: whole disk (or Slave: whole disk (or
For partitions, add to the whole disk device number:		
	0 = /dev/hd?	Whole disk
	1 = /dev/hd?1	First partition
	2 = /dev/hd?2	Second partition
	...	
	63 = /dev/hd?63	63rd partition
For Linux/i386, partitions 1-4 are the primary partitions, and 5 and above are logical partitions. Other versions of Linux use partitioning schemes appropriate to their respective architectures.		
4 char	TTY devices 0 = /dev/tty0  1 = /dev/tty1  ...	Current virtual console  First virtual console  63rd virtual console
	64 = /dev/ttys0  ...	First UART serial port  255 = /dev/ttys191
		192nd UART serial port
UART serial ports refer to 8250/16450/16550 series devices.		
↳ this	Older versions of the Linux kernel used this major number for BSD PTY devices. As of Linux 2.1.115, this is no longer supported. Use major numbers 2 and 3.	
4 block ↳ be used ↳ nodes	Aliases for dynamically allocated major devices to when its not possible to create the real device because the root filesystem is mounted read-only.	
	0 = /dev/root	
5 char	Alternate TTY devices 0 = /dev/tty 1 = /dev/console 2 = /dev/ptmx 3 = /dev/ttysprintk	Current TTY device System console PTY master multiplex User messages via printk
↳ TTY device	64 = /dev/cua0	Callout device for ttys0

	...	
	255 = /dev/cua191	Callout device for ttyS191
→ See	(5,1) is /dev/console starting with Linux 2.1.71.	↳
	the section on terminal devices for more information on /dev/console.	
6 char	Parallel printer devices	
	0 = /dev/lp0	Parallel printer on parport0
	1 = /dev/lp1	Parallel printer on parport1
	...	
→ layer.	Current Linux kernels no longer have a fixed mapping between parallel ports and I/O addresses. Instead, they are redirected through the parport multiplex.	↳
7 char	Virtual console capture devices	
→ contents	0 = /dev/vcs	Current vc text (glyph)
	1 = /dev/vcs1	tty1 text (glyph) contents
	...	
	63 = /dev/vcs63	tty63 text (glyph) contents
→ contents	64 = /dev/vcsu	Current vc text (unicode)
	65 = /dev/vcsu1	tty1 text (unicode) contents
→ contents	...	
	127 = /dev/vcsu63	tty63 text (unicode)
→ contents	128 = /dev/vcsa	Current vc text/attribute
→ (glyph) contents	129 = /dev/vcsa1	tty1 text/attribute (glyph)
→ contents	...	
→ (glyph) contents	191 = /dev/vcsa63	tty63 text/attribute
→ access.	NOTE: These devices permit both read and write.	↳
7 block	Loopback devices	
	0 = /dev/loop0	First loop device
	1 = /dev/loop1	Second loop device
	...	
	The loop devices are used to mount filesystems not associated with block devices. The binding to the loop devices is handled by mount(8) or losetup(8).	
8 block	SCSI disk devices (0-15)	

<pre> 0 = /dev/sda 16 = /dev/sdb 32 = /dev/sdc ... 240 = /dev/sdp </pre>	First SCSI disk whole disk Second SCSI disk whole disk Third SCSI disk whole disk ... Sixteenth SCSI disk whole <u>disk</u>
--	--

Partitions are handled in the same way as for IDE disks (see major number 3) except that the limit on partitions is 15.

9 char	SCSI tape devices	
	0 = /dev/st0	First SCSI tape, mode 0
	1 = /dev/st1	Second SCSI tape, mode 0
	...	
	32 = /dev/st0l	First SCSI tape, mode 1
	33 = /dev/st1l	Second SCSI tape, mode 1
	...	
	64 = /dev/st0m	First SCSI tape, mode 2
	65 = /dev/st1m	Second SCSI tape, mode 2
	...	
	96 = /dev/st0a	First SCSI tape, mode 3
	97 = /dev/st1a	Second SCSI tape, mode 3
	...	
→rewind	128 = /dev/nst0	First SCSI tape, mode 0, no <u>rewind</u>
→no rewind	129 = /dev/nst1	Second SCSI tape, mode 0, <u>no rewind</u>
→rewind	160 = /dev/nst0l	First SCSI tape, mode 1, no <u>rewind</u>
→no rewind	161 = /dev/nst1l	Second SCSI tape, mode 1, <u>no rewind</u>
→rewind	192 = /dev/nst0m	First SCSI tape, mode 2, no <u>rewind</u>
→no rewind	193 = /dev/nst1m	Second SCSI tape, mode 2, <u>no rewind</u>
→rewind	224 = /dev/nst0a	First SCSI tape, mode 3, no <u>rewind</u>
→no rewind	225 = /dev/nst1a	Second SCSI tape, mode 3, <u>no rewind</u>
	...	

"No rewind" refers to the omission of the default automatic rewind on device close. The MTREW or ioctl()'s can be used to rewind the tape regardlessof the device used to access it.

9 block	Metadisk (RAID) devices	
	0 = /dev/md0	First metadisk group
	1 = /dev/md1	Second metadisk group
	...	
		The metadisk driver is used to span a filesystem across multiple physical disks.
10 char	Non-serial mice, misc features	
	0 = /dev/logibm	Logitech bus mouse
	1 = /dev/psaux	PS/2-style mouse port
	2 = /dev/inportbm	Microsoft Inport bus mouse

              0 = /dev/aztcd       Aztech CD-ROM

```

30 char	iBCS-2 compatibility devices
	0 = /dev/socksys      Socket access
	1 = /dev/spx          SVR3 local X interface
	32 = /dev/inet/ip     Network access
	33 = /dev/inet/icmp
	34 = /dev/inet/ggp
	35 = /dev/inet/ipp
	36 = /dev/inet/tcp
	37 = /dev/inet/egp
	38 = /dev/inet/pup
	39 = /dev/inet/udp
	40 = /dev/inet/idp
	41 = /dev/inet/rawip

Additionally, iBCS-2 requires the following links:

```
/dev/ip -> /dev/inet/ip
/dev/icmp -> /dev/inet/icmp
/dev/ggp -> /dev/inet/ggp
/dev/ipp -> /dev/inet/ipp
/dev/tcp -> /dev/inet/tcp
/dev/egp -> /dev/inet/egp
/dev/pup -> /dev/inet/pup
/dev/udp -> /dev/inet/udp
/dev/idp -> /dev/inet/idp
/dev/rawip -> /dev/inet/rawip
/dev/inet/arp -> /dev/inet/arp
/dev/inet/rip -> /dev/inet/rip
/dev/nfsd -> /dev/socksys
/dev/XOR -> /dev/null (? apparently not required ?)
```

30 block	Philips LMS CM-205 CD-ROM
	0 = /dev/cm205cd      Philips LMS CM-205 CD-ROM

`/dev/lmscd` is an older name for this device. This driver does not work with the CM-205MS CD-ROM.

31 char	MPU-401 MIDI
	0 = /dev/mpu401data    MPU-401 data port
	1 = /dev/mpu401stat    MPU-401 status port

31 block	ROM/flash memory card
	0 = /dev/rom0          First ROM card (rw)
	...
	7 = /dev/rom7          Eighth ROM card (rw)
	8 = /dev/rrom0        First ROM card (ro)
	...
	15 = /dev/rrom7       Eighth ROM card (ro)
	16 = /dev/flash0      First flash memory card (rw)
	...
	23 = /dev/flash7      Eighth flash memory card

```

→(rw)
  24 = /dev/rflash0      First flash memory card (ro)
  ...
  31 = /dev/rflash7      Eighth flash memory card
→(ro)

```

The read-write (rw) devices support back-caching written data in RAM, as well as writing to flash RAM devices. The read-only devices (ro) support reading only.

40 block	
41 char	Yet Another Micro Monitor 0 = /dev/yamm      Yet Another Micro Monitor
41 block	

42 char      Demo/sample use

42 block      Demo/sample use

This number is intended for use in sample code, as well as a general "example" device number. It should never be used for a device driver that isbeing  
distributed; either obtain an official number or use the local/experimental range. The sudden additionor  
removal of a driver with this number should notcause  
ill effects to the system (bugs excepted.)

IN PARTICULAR, ANY DISTRIBUTION WHICH CONTAINS A DEVICE DRIVER USING MAJOR NUMBER 42 IS NONCOMPLIANT.

43 char      isdn4linux virtual modem  
              0 = /dev/ttyI0      First virtual modem

43 block      Network block devices  
              0 = /dev/nb0      First network block device  
              1 = /dev/nb1      Second network block device  
              ...

Network Block Device is somehow similar to loopback devices: If you read from it, it sends packet across network asking server for data. If you write to it,it  
sends packet telling server to write. It could beused  
to mounting filesystems over the net, swapping over the net, implementing block device in userland etc.

116 block MicroMemory battery backed RAM adapter (NVRAM)  
Supports 16 boards, 15 partitions each.  
Requested by neilb at cse.unsw.edu.au.

```
          0 = /dev/umem/d0    Whole of first board
```

↳ board                    1 = /dev/umem/d0p1     First partition of first board  
↳ board                    2 = /dev/umem/d0p2     Second partition of first board  
↳ board                    15 = /dev/umem/d0p15    15th partition of first board  
                            16 = /dev/umem/d1       Whole of second board  
                            17 = /dev/umem/d1p1     First partition of second board  
↳ board                    ...  
                            255= /dev/umem/d15p15   15th partition of 16th board.

117 char                  COSA/SRP synchronous serial card  
                            0 = /dev/cosa0c0       1st board, 1st channel  
                            1 = /dev/cosa0c1       1st board, 2nd channel  
                            ...  
                            16 = /dev/cosalc0      2nd board, 1st channel  
                            17 = /dev/cosalc1      2nd board, 2nd channel  
                            ...

117 block                 Enterprise Volume Management System (EVMS)  
↳ provide                The EVMS driver uses a layered, plug-in model to provide  
↳ managing                unparalleled flexibility and extensibility in managing  
↳ customization        storage. This allows for easy expansion or customization  
↳ by                     of various levels of volume management. Requested by  
                           Mark Peloquin (peloquin at us.ibm.com).  
  
Note: EVMS populates and manages all the devnodes in /dev/evms.  
  
<http://sf.net/projects/evms>

0 = /dev/evms/block\_device     EVMS block device  
1 = /dev/evms/legacynamel    First EVMS legacy device  
2 = /dev/evms/legacyname2    Second EVMS legacy device  
...  
Both ranges can grow (down or up) until they meet.  
...  
254 = /dev/evms/EVMSname2    Second EVMS native device  
255 = /dev/evms/EVMSname1    First EVMS native device

	Note: legacyname(s) are derived from the normal device names. For example, /dev/hda5 would become /dev/evms/hda5.

		The OnStream SC-x0 SCSI tapes do not support the standard SCSI SASD command set and therefore need their own driver "osst". Note that the IDE, USB (and maybe ParPort) versions may be driven via ide-scsi.
↳ or		
		usb-storage SCSI emulation and this osst device and driver as well. The ADR-x0 drives are QIC-157 compliant and don't need osst.

## 3.1 Additional /dev/ directory entries

This section details additional entries that should or may exist in the /dev directory. It is preferred that symbolic links use the same form (absolute or relative) as is indicated here. Links are classified as “hard” or “symbolic” depending on the preferred type of link; if possible, the indicated type of link should be used.

### 3.1.1 Compulsory links

These links should exist on all systems:

/dev/fd	/proc/self/fd	symbolic	File descriptors
/dev/stdin	fd/0	symbolic	stdin file descriptor
/dev/stdout	fd/1	symbolic	stdout file descriptor
/dev/stderr	fd/2	symbolic	stderr file descriptor
/dev/nfsd	socksys	symbolic	Required by iBCS-2
/dev/X0R	null	symbolic	Required by iBCS-2

Note: /dev/X0R is <letter X>-<digit 0>-<letter R>.

### 3.1.2 Recommended links

It is recommended that these links exist on all systems:

/dev/core	/proc/kcore	symbolic	Backward compatibility
/dev/ramdisk	ram0	symbolic	Backward compatibility
/dev/ftape	qft0	symbolic	Backward compatibility
/dev/bttv0	video0	symbolic	Backward compatibility
/dev/radio	radio0	symbolic	Backward compatibility
/dev/i2o*	/dev/i2o/*	symbolic	Backward compatibility
/dev/scd?	sr?	hard	Alternate SCSI CD-ROM name

### 3.1.3 Locally defined links

The following links may be established locally to conform to the configuration of the system. This is merely a tabulation of existing practice, and does not constitute a recommendation. However, if they exist, they should have the following uses.

/dev/mouse	mouse port	symbolic	Current mouse device
/dev/tape	tape device	symbolic	Current tape device
/dev/cdrom	CD-ROM device	symbolic	Current CD-ROM device
/dev/cdwriter	CD-writer	symbolic	Current CD-writer device
/dev/scanner	scanner	symbolic	Current scanner device
/dev/modem	modem port	symbolic	Current dialout device
/dev/root	root device	symbolic	Current root filesystem
/dev/swap	swap device	symbolic	Current swap device

`/dev/modem` should not be used for a modem which supports dialin as well as dialout, as it tends to cause lock file problems. If it exists, `/dev/modem` should point to the appropriate primary TTY device (the use of the alternate callout devices is deprecated).

For SCSI devices, `/dev/tape` and `/dev/cdrom` should point to the *cooked* devices (`/dev/st*` and `/dev/sr*`, respectively), whereas `/dev/cdwriter` and `/dev/scanner` should point to the appropriate generic SCSI devices (`/dev/sg*`).

`/dev/mouse` may point to a primary serial TTY device, a hardware mouse device, or a socket for a mouse driver program (e.g. `/dev/gpmdata`).

### 3.1.4 Sockets and pipes

Non-transient sockets and named pipes may exist in `/dev`. Common entries are:

/dev/printer	socket	lpd local socket
/dev/log	socket	syslog local socket
/dev/gpmdata	socket	gpm mouse multiplexer

### 3.1.5 Mount points

The following names are reserved for mounting special filesystems under `/dev`. These special filesystems provide kernel interfaces that cannot be provided with standard device nodes.

/dev/pts	devpts	PTY slave filesystem
/dev/shm	tmpfs	POSIX shared memory maintenance access

## 3.2 Terminal devices

Terminal, or TTY devices are a special class of character devices. A terminal device is any device that could act as a controlling terminal for a session; this includes virtual consoles, serial ports, and pseudoterminals (PTYs).

All terminal devices share a common set of capabilities known as line disciplines; these include the common terminal line discipline as well as SLIP and PPP modes.

All terminal devices are named similarly; this section explains the naming and use of the various types of TTYs. Note that the naming conventions include several historical warts; some of these are Linux-specific, some were inherited from other systems, and some reflect Linux outgrowing a borrowed convention.

A hash mark (#) in a device name is used here to indicate a decimal number without leading zeroes.

### 3.2.1 Virtual consoles and the console device

Virtual consoles are full-screen terminal displays on the system video monitor. Virtual consoles are named `/dev/tty#`, with numbering starting at `/dev/tty1`; `/dev/tty0` is the current virtual console. `/dev/tty0` is the device that should be used to access the system video card on those architectures for which the frame buffer devices (`/dev/fb*`) are not applicable. Do not use `/dev/console` for this purpose.

The console device, `/dev/console`, is the device to which system messages should be sent, and on which logins should be permitted in single-user mode. Starting with Linux 2.1.71, `/dev/console` is managed by the kernel; for previous versions it should be a symbolic link to either `/dev/tty0`, a specific virtual console such as `/dev/tty1`, or to a serial port primary (`tty*`, not `cu*`) device, depending on the configuration of the system.

### 3.2.2 Serial ports

Serial ports are RS-232 serial ports and any device which simulates one, either in hardware (such as internal modems) or in software (such as the ISDN driver.) Under Linux, each serial port has two device names, the primary or callin device and the alternate or callout one. Each kind of device is indicated by a different letter. For any letter X, the names of the devices are `/dev/ttyX#` and `/dev/cux#`, respectively; for historical reasons, `/dev/ttyS#` and `/dev/ttyC#` correspond to `/dev/cua#` and `/dev/cub#`. In the future, it should be expected that multiple letters will be used; all letters will be upper case for the “tty” device (e.g. `/dev/ttyDP#`) and lower case for the “cu” device (e.g. `/dev/cudp#`).

The names `/dev/ttyQ#` and `/dev/cuq#` are reserved for local use.

The alternate devices provide for kernel-based exclusion and somewhat different defaults than the primary devices. Their main purpose is to allow the use of serial ports with programs with no inherent or broken support for serial ports. Their use is deprecated, and they may be removed from a future version of Linux.

Arbitration of serial ports is provided by the use of lock files with the names `/var/lock/LCK..ttyX#`. The contents of the lock file should be the PID of the locking process as an ASCII number.

It is common practice to install links such as `/dev/modem` which point to serial ports. In order to ensure proper locking in the presence of these links, it is recommended that software chase symlinks and lock all possible names; additionally, it is recommended that a lock file be installed with the corresponding alternate device. In order to avoid deadlocks, it is recommended that the locks are acquired in the following order, and released in the reverse:

1. The symbolic link name, if any (`/var/lock/LCK..modem`)
2. The “tty” name (`/var/lock/LCK..ttyS2`)
3. The alternate device name (`/var/lock/LCK..cua2`)

In the case of nested symbolic links, the lock files should be installed in the order the symlinks are resolved.

Under no circumstances should an application hold a lock while waiting for another to be released. In addition, applications which attempt to create lock files for the corresponding alternate device names should take into account the possibility of being used on a non-serial port TTY, for which no alternate device would exist.

### **3.2.3 Pseudoterminals (PTYs)**

Pseudoterminals, or PTYs, are used to create login sessions or provide other capabilities requiring a TTY line discipline (including SLIP or PPP capability) to arbitrary data-generation processes. Each PTY has a master side, named `/dev/pty[p-zA-E][0-9a-f]`, and a slave side, named `/dev/tty[p-zA-E][0-9a-f]`. The kernel arbitrates the use of PTYs by allowing each master side to be opened only once.

Once the master side has been opened, the corresponding slave device can be used in the same manner as any TTY device. The master and slave devices are connected by the kernel, generating the equivalent of a bidirectional pipe with TTY capabilities.

Recent versions of the Linux kernels and GNU libc contain support for the System V/Unix98 naming scheme for PTYs, which assigns a common device, `/dev/ptmx`, to all the masters (opening it will automatically give you a previously unassigned PTY) and a subdirectory, `/dev/pts`, for the slaves; the slaves are named with decimal integers (`/dev/pts/#` in our notation). This removes the problem of exhausting the namespace and enables the kernel to automatically create the device nodes for the slaves on demand using the “`devpts`” filesystem.

## **DOCUMENTATION FOR /PROC/SYS**

Copyright (c) 1998, 1999, Rik van Riel <[riel@nl.linux.org](mailto:riel@nl.linux.org)>

---

'Why' , I hear you ask, 'would anyone even \_want\_ documentation for them sysctl files? If anybody really needs it, it' s all in the source…'

Well, this documentation is written because some people either don' t know they need to tweak something, or because they don' t have the time or knowledge to read the source code.

Furthermore, the programmers who built sysctl have built it to be actually used, not just for the fun of programming it :-)

---

Legal blurb:

As usual, there are two main things to consider:

1. you get what you pay for
2. it' s free

The consequences are that I won' t guarantee the correctness of this document, and if you come to me complaining about how you screwed up your system because of wrong documentation, I won' t feel sorry for you. I might even laugh at you…

But of course, if you \_do\_ manage to screw up your system using only the sysctl options used in this file, I' d like to hear of it. Not only to have a great laugh, but also to make sure that you' re the last RTFMing person to screw up.

In short, e-mail your suggestions, corrections and / or horror stories to:  
<[riel@nl.linux.org](mailto:riel@nl.linux.org)>

Rik van Riel.

---

## 4.1 Introduction

Sysctl is a means of configuring certain aspects of the kernel at run-time, and the /proc/sys/ directory is there so that you don't even need special tools to do it! In fact, there are only four things needed to use these config facilities:

- a running Linux system
- root access
- common sense (this is especially hard to come by these days)
- knowledge of what all those values mean

As a quick ‘ls /proc/sys’ will show, the directory consists of several (arch-dependent?) subdirs. Each subdir is mainly about one part of the kernel, so you can do configuration on a piece by piece basis, or just some ‘thematic frobbing’ .

This documentation is about:

abi/	execution domains & personalities
de-	<empty>
bug/	
dev/	device specific information (eg dev/cdrom/info)
fs/	specific filesystems filehandle, inode, dentry and quota tuning binfmt_misc <i>&lt;Kernel Support for miscellaneous Binary Formats (binfmt_misc)&gt;</i>
ker-	global kernel info / tuning miscellaneous stuff
nel/	
net/	networking stuff, for documentation look in: <i>&lt;Documentation/networking/&gt;</i>
proc/	<empty>
sun-	SUN Remote Procedure Call (NFS)
rpc/	
vm/	memory management tuning buffer and cache management
user/	Per user per user namespace limits

These are the subdirs I have on my system. There might be more or other subdirs in another setup. If you see another dir, I'd really like to hear about it :-)

### 4.1.1 Documentation for /proc/sys/abi/

Copyright (c) 2020, Stephen Kitt

For general info, see [Documentation for /proc/sys](#).

---

The files in /proc/sys/abi can be used to see and modify ABI-related settings.

Currently, these files might (depending on your configuration) show up in /proc/sys/kernel:

- *vsyscall32 (x86)*

## **vsy়call32 (x86)**

Determines whether the kernels maps a vDSO page into 32-bit processes; can be set to 1 to enable, or 0 to disable. Defaults to enabled if CONFIG\_COMPAT\_VDSO is set, disabled otherwise.

This controls the same setting as the vdso32 kernel boot parameter.

### **4.1.2 Documentation for /proc/sys/fs/**

kernel version 2.2.10

Copyright (c) 1998, 1999, Rik van Riel <[riel@nl.linux.org](mailto:riel@nl.linux.org)>

Copyright (c) 2009, Shen Feng<[shen@cn.fujitsu.com](mailto:shen@cn.fujitsu.com)>

For general info and legal blurb, please look in intro.rst.

---

This file contains documentation for the sysctl files in /proc/sys/fs/ and is valid for Linux kernel version 2.2.

The files in this directory can be used to tune and monitor miscellaneous and general things in the operation of the Linux kernel. Since some of the files can be used to screw up your system, it is advisable to read both documentation and source before actually making adjustments.

#### **1. /proc/sys/fs**

Currently, these files are in /proc/sys/fs:

- aio-max-nr
- aio-nr
- dentry-state
- dquot-max
- dquot-nr
- file-max
- file-nr
- inode-max
- inode-nr
- inode-state
- nr\_open
- overflowuid

- overflowgid
- pipe-user-pages-hard
- pipe-user-pages-soft
- protected\_fifos
- protected\_hardlinks
- protected\_regular
- protected\_symlinks
- uid\_dumpable
- super-max
- super-nr

### aio-nr & aio-max-nr

aio-nr is the running total of the number of events specified on the io\_setup system call for all currently active aio contexts. If aio-nr reaches aio-max-nr then io\_setup will fail with EAGAIN. Note that raising aio-max-nr does not result in the pre-allocation or re-sizing of any kernel data structures.

### dentry-state

From linux/include/linux/dcache.h:

```
struct dentry_stat_t dentry_stat {  
    int nr_dentry;  
    int nr_unused;  
    int age_limit;          /* age in seconds */  
    int want_pages;         /* pages requested by system */  
    int nr_negative;        /* # of unused negative dentries */  
    int dummy;              /* Reserved for future use */  
};
```

Dentries are dynamically allocated and deallocated.

nr\_dentry shows the total number of dentries allocated (active + unused). nr\_unused shows the number of dentries that are not actively used, but are saved in the LRU list for future reuse.

Age\_limit is the age in seconds after which dcache entries can be reclaimed when memory is short and want\_pages is nonzero when shrink\_dcache\_pages() has been called and the dcache isn't pruned yet.

nr\_negative shows the number of unused dentries that are also negative dentries which do not map to any files. Instead, they help speeding up rejection of non-existing files provided by the users.

## **dquot-max & dquot-nr**

The file dquot-max shows the maximum number of cached disk quota entries.

The file dquot-nr shows the number of allocated disk quota entries and the number of free disk quota entries.

If the number of free cached disk quotas is very low and you have some awesome number of simultaneous system users, you might want to raise the limit.

## **file-max & file-nr**

The value in file-max denotes the maximum number of file-handles that the Linux kernel will allocate. When you get lots of error messages about running out of file handles, you might want to increase this limit.

Historically, the kernel was able to allocate file handles dynamically, but not to free them again. The three values in file-nr denote the number of allocated file handles, the number of allocated but unused file handles, and the maximum number of file handles. Linux 2.6 always reports 0 as the number of free file handles – this is not an error, it just means that the number of allocated file handles exactly matches the number of used file handles.

Attempts to allocate more file descriptors than file-max are reported with printk, look for “VFS: file-max limit <number> reached” .

## **nr\_open**

This denotes the maximum number of file-handles a process can allocate. Default value is 1024\*1024 (1048576) which should be enough for most machines. Actual limit depends on RLIMIT\_NOFILE resource limit.

## **inode-max, inode-nr & inode-state**

As with file handles, the kernel allocates the inode structures dynamically, but can't free them yet.

The value in inode-max denotes the maximum number of inode handlers. This value should be 3-4 times larger than the value in file-max, since stdin, stdout and network sockets also need an inode struct to handle them. When you regularly run out of inodes, you need to increase this value.

The file inode-nr contains the first two items from inode-state, so we'll skip to that file…

Inode-state contains three actual numbers and four dummies. The actual numbers are, in order of appearance, nr\_inodes, nr\_free\_inodes and preshrink.

Nr\_inodes stands for the number of inodes the system has allocated, this can be slightly more than inode-max because Linux allocates them one pageful at a time.

`Nr_free_inodes` represents the number of free inodes (?) and `preshrink` is nonzero when the `nr_inodes > inode-max` and the system needs to prune the inode list instead of allocating more.

### **overflowgid & overflowuid**

Some filesystems only support 16-bit UIDs and GIDs, although in Linux UIDs and GIDs are 32 bits. When one of these filesystems is mounted with writes enabled, any UID or GID that would exceed 65535 is translated to a fixed value before being written to disk.

These sysctls allow you to change the value of the fixed UID and GID. The default is 65534.

### **pipe-user-pages-hard**

Maximum total number of pages a non-privileged user may allocate for pipes. Once this limit is reached, no new pipes may be allocated until usage goes below the limit again. When set to 0, no limit is applied, which is the default setting.

### **pipe-user-pages-soft**

Maximum total number of pages a non-privileged user may allocate for pipes before the pipe size gets limited to a single page. Once this limit is reached, new pipes will be limited to a single page in size for this user in order to limit total memory usage, and trying to increase them using `fctl()` will be denied until usage goes below the limit again. The default value allows to allocate up to 1024 pipes at their default size. When set to 0, no limit is applied.

### **protected\_fifos**

The intent of this protection is to avoid unintentional writes to an attacker-controlled FIFO, where a program expected to create a regular file.

When set to “0”, writing to FIFOs is unrestricted.

When set to “1” don’t allow `O_CREAT` open on FIFOs that we don’t own in world writable sticky directories, unless they are owned by the owner of the directory.

When set to “2” it also applies to group writable sticky directories.

This protection is based on the restrictions in Openwall.

### **protected\_hardlinks**

A long-standing class of security issues is the hardlink-based time-of-check-time-of-use race, most commonly seen in world-writable directories like /tmp. The common method of exploitation of this flaw is to cross privilege boundaries when following a given hardlink (i.e. a root process follows a hardlink created by another user). Additionally, on systems without separated partitions, this stops unauthorized users from “pinning” vulnerable setuid/setgid files against being upgraded by the administrator, or linking to special files.

When set to “0”, hardlink creation behavior is unrestricted.

When set to “1” hardlinks cannot be created by users if they do not already own the source file, or do not have read/write access to it.

This protection is based on the restrictions in Openwall and grsecurity.

### **protected\_regular**

This protection is similar to protected\_fifos, but it avoids writes to an attacker-controlled regular file, where a program expected to create one.

When set to “0”, writing to regular files is unrestricted.

When set to “1” don’t allow O\_CREAT open on regular files that we don’t own in world writable sticky directories, unless they are owned by the owner of the directory.

When set to “2” it also applies to group writable sticky directories.

### **protected\_symlinks**

A long-standing class of security issues is the symlink-based time-of-check-time-of-use race, most commonly seen in world-writable directories like /tmp. The common method of exploitation of this flaw is to cross privilege boundaries when following a given symlink (i.e. a root process follows a symlink belonging to another user). For a likely incomplete list of hundreds of examples across the years, please see: <https://cve.mitre.org/cgi-bin/cvekey.cgi?keyword=/tmp>

When set to “0”, symlink following behavior is unrestricted.

When set to “1” symlinks are permitted to be followed only when outside a sticky world-writable directory, or when the uid of the symlink and follower match, or when the directory owner matches the symlink’s owner.

This protection is based on the restrictions in Openwall and grsecurity.

### **suid\_dumpable:**

This value can be used to query and set the core dump mode for setuid or otherwise protected/tainted binaries. The modes are

- 
- 0 (de- traditional behaviour. Any process which has changed privilege levels faul or is execute only will not be dumped.
  - 1 (de- all processes dump core when possible. The core dump is owned by bug the current user and no security is applied. This is intended for system debugging situations only. Ptrace is unchecked. This is insecure as it allows regular users to examine the memory contents of privileged processes.
  - 2 (sui any binary which normally would not be dumped is dumped anyway, but safe only if the “core\_pattern” kernel sysctl is set to either a pipe handler or a fully qualified path. (For more details on this limitation, see CVE-2006-2451.) This mode is appropriate when administrators are attempting to debug problems in a normal environment, and either have a core dump pipe handler that knows to treat privileged core dumps with care, or specific directory defined for catching core dumps. If a core dump happens without a pipe handler or fully qualified path, a message will be emitted to syslog warning about the lack of a correct setting.
- 

### **super-max & super-nr**

These numbers control the maximum number of superblocks, and thus the maximum number of mounted filesystems the kernel can have. You only need to increase super-max if you need to mount more filesystems than the current value in super-max allows you to.

### **aio-nr & aio-max-nr**

aio-nr shows the current system-wide number of asynchronous io requests. aio-max-nr allows you to change the maximum value aio-nr can grow to.

### **mount-max**

This denotes the maximum number of mounts that may exist in a mount namespace.

## **2. /proc/sys/fs/binfmt\_misc**

Documentation for the files in /proc/sys/fs/binfmt\_misc is in *Kernel Support for miscellaneous Binary Formats (binfmt\_misc)*.

## **3. /proc/sys/fs/mqueue - POSIX message queues filesystem**

The “mqueue” filesystem provides the necessary kernel features to enable the creation of a user space library that implements the POSIX message queues API (as noted by the MSG tag in the POSIX 1003.1-2001 version of the System Interfaces specification.)

The “mqueue” filesystem contains values for determining/setting the amount of resources used by the file system.

/proc/sys/fs/mqueue/queues\_max is a read/write file for setting/getting the maximum number of message queues allowed on the system.

/proc/sys/fs/mqueue/msg\_max is a read/write file for setting/getting the maximum number of messages in a queue value. In fact it is the limiting value for another (user) limit which is set in mq\_open invocation. This attribute of a queue must be less or equal than msg\_max.

/proc/sys/fs/mqueue/msgsize\_max is a read/write file for setting/getting the maximum message size value (it is every message queue’s attribute set during its creation).

/proc/sys/fs/mqueue/msg\_default is a read/write file for setting/getting the default number of messages in a queue value if attr parameter of mq\_open(2) is NULL. If it exceed msg\_max, the default value is initialized msg\_max.

/proc/sys/fs/mqueue/msgsize\_default is a read/write file for setting/getting the default message size value if attr parameter of mq\_open(2) is NULL. If it exceed msgsize\_max, the default value is initialized msgsize\_max.

## **4. /proc/sys/fs/epoll - Configuration options for the epoll interface**

This directory contains configuration options for the epoll(7) interface.

### **max\_user\_watches**

Every epoll file descriptor can store a number of files to be monitored for event readiness. Each one of these monitored files constitutes a “watch”. This configuration option sets the maximum number of “watches” that are allowed for each user. Each “watch” costs roughly 90 bytes on a 32bit kernel, and roughly 160 bytes on a 64bit one. The current default value for max\_user\_watches is the 1/32 of the available low memory, divided for the “watch” cost in bytes.

### **4.1.3 Documentation for /proc/sys/kernel/**

Copyright (c) 1998, 1999, Rik van Riel <riel@nl.linux.org>

Copyright (c) 2009, Shen Feng<shen@cn.fujitsu.com>

For general info and legal blurb, please look in *Documentation for /proc/sys*.

---

This file contains documentation for the sysctl files in /proc/sys/kernel/ and is valid for Linux kernel version 2.2.

The files in this directory can be used to tune and monitor miscellaneous and general things in the operation of the Linux kernel. Since some of the files *can* be used to screw up your system, it is advisable to read both documentation and source before actually making adjustments.

Currently, these files might (depending on your configuration) show up in /proc/sys/kernel:

- *acct*
- *acpi\_video\_flags*
- *auto\_msgmni*
- *bootloader\_type (x86 only)*
- *bootloader\_version (x86 only)*
- *bpf\_stats\_enabled*
- *cad\_pid*
- *cap\_last\_cap*
- *core\_pattern*
- *core\_pipe\_limit*
- *core\_uses\_pid*
- *ctrl-alt-del*
- *dmesg\_restrict*
- *domainname & hostname*
- *firmware\_config*
- *ftrace\_dump\_on\_oops*
- *ftrace\_enabled, stack\_tracer\_enabled*

**acct**

<code>highwater lowwater frequency</code>
---

If BSD-style process accounting is enabled these values control its behaviour. If free space on filesystem where the log lives goes below `lowwater``%` accounting suspends. If free space gets above ```highwater``%` accounting resumes. ```frequency` determines how often do we check the amount of free space (value is in seconds). Default:

<code>4 2 30</code>
---------------------

That is, suspend accounting if free space drops below 2%; resume it if it increases to at least 4%; consider information about amount of free space valid for 30 seconds.

**acpi\_video\_flags**

See `/power/video`. This allows the video resume mode to be set, in a similar fashion to the `acpi_sleep` kernel parameter, by combining the following values:

1	<code>s3_bios</code>
2	<code>s3_mode</code>
4	<code>s3_beep</code>

### **auto\_msrmni**

This variable has no effect and may be removed in future kernel releases. Reading it always returns 0. Up to Linux 3.17, it enabled/disabled automatic recomputing of *msgmni* upon memory add/remove or upon IPC namespace creation/removal. Echoing “1” into this file enabled msgmni automatic recomputing. Echoing “0” turned it off. The default value was 1.

### **bootloader\_type (x86 only)**

This gives the bootloader type number as indicated by the bootloader, shifted left by 4, and OR’ d with the low four bits of the bootloader version. The reason for this encoding is that this used to match the *type\_of\_loader* field in the kernel header; the encoding is kept for backwards compatibility. That is, if the full bootloader type number is 0x15 and the full version number is 0x234, this file will contain the value  $340 = 0x154$ .

See the *type\_of\_loader* and *ext\_loader\_type* fields in /x86/boot for additional information.

### **bootloader\_version (x86 only)**

The complete bootloader version number. In the example above, this file will contain the value  $564 = 0x234$ .

See the *type\_of\_loader* and *ext\_loader\_ver* fields in /x86/boot for additional information.

### **bpf\_stats\_enabled**

Controls whether the kernel should collect statistics on BPF programs (total time spent running, number of times run…). Enabling statistics causes a slight reduction in performance on each program run. The statistics can be seen using *bpftool*.

---

0	Don’t collect statistics (default).
1	Collect statistics.

---

### **cad\_pid**

This is the pid which will be signalled on reboot (notably, by Ctrl-Alt-Delete). Writing a value to this file which doesn’t correspond to a running process will result in -ESRCH.

See also *ctrl-alt-del*.

## **cap\_last\_cap**

Highest valid capability of the running kernel. Exports CAP\_LAST\_CAP from the kernel.

## **core\_pattern**

`core_pattern` is used to specify a core dumpfile pattern name.

- max length 127 characters; default value is “core”
- `core_pattern` is used as a pattern template for the output filename; certain string patterns (beginning with ‘%’ ) are substituted with their actual values.
- backward compatibility with `core_uses_pid`:  
If `core_pattern` does not include “%p” (default does not) and `core_uses_pid` is set, then .PID will be appended to the filename.
- corename format specifiers

%<NUL>	‘%’ is dropped
%%	output one ‘%’
%p	pid
%P	global pid (init PID namespace)
%i	tid
%I	global tid (init PID namespace)
%u	uid (in initial user namespace)
%g	gid (in initial user namespace)
%d	dump mode, matches PR_SET_DUMPABLE and /proc/sys/fs/suid_dumpable
%s	signal number
%t	UNIX time of dump
%h	hostname
%e	executable filename (may be shortened, could be changed by prctl etc)
%f	executable filename
%E	executable path
%c	maximum size of core file by resource limit RLIMIT_CORE
%<OTHEI	both are dropped

- If the first character of the pattern is a ‘|’ , the kernel will treat the rest of the pattern as a command to run. The core dump will be written to the standard input of that program instead of to a file.

### **core\_pipe\_limit**

This sysctl is only applicable when *core\_pattern* is configured to pipe core files to a user space helper (when the first character of *core\_pattern* is a ‘|’, see above). When collecting cores via a pipe to an application, it is occasionally useful for the collecting application to gather data about the crashing process from its /proc/pid directory. In order to do this safely, the kernel must wait for the collecting process to exit, so as not to remove the crashing processes proc files prematurely. This in turn creates the possibility that a misbehaving userspace collecting process can block the reaping of a crashed process simply by never exiting. This sysctl defends against that. It defines how many concurrent crashing processes may be piped to user space applications in parallel. If this value is exceeded, then those crashing processes above that value are noted via the kernel log and their cores are skipped. 0 is a special value, indicating that unlimited processes may be captured in parallel, but that no waiting will take place (i.e. the collecting process is not guaranteed access to /proc/<crashing pid>/). This value defaults to 0.

### **core\_uses\_pid**

The default coredump filename is “core”. By setting *core\_uses\_pid* to 1, the core-dump filename becomes core.PID. If *core\_pattern* does not include “%p” (default does not) and *core\_uses\_pid* is set, then .PID will be appended to the filename.

### **ctrl-alt-del**

When the value in this file is 0, ctrl-alt-del is trapped and sent to the `init(1)` program to handle a graceful restart. When, however, the value is > 0, Linux’ s reaction to a Vulcan Nerve Pinch (tm) will be an immediate reboot, without even syncing its dirty buffers.

#### **Note:**

when a program (like dosemu) has the keyboard in ‘raw’ mode, the ctrl-alt-del is intercepted by the program before it ever reaches the kernel tty layer, and it’ s up to the program to decide what to do with it.

### **dmesg\_restrict**

This toggle indicates whether unprivileged users are prevented from using `dmesg(8)` to view messages from the kernel’ s log buffer. When *dmesg\_restrict* is set to 0 there are no restrictions. When *dmesg\_restrict* is set to 1, users must have CAP\_SYSLOG to use `dmesg(8)`.

The kernel config option `CONFIG_SECURITY_DMESG_RESTRICT` sets the default value of *dmesg\_restrict*.

## domainname & hostname

These files can be used to set the NIS/YP domainname and the hostname of your box in exactly the same way as the commands `domainname` and `hostname`, i.e.:

```
# echo "darkstar" > /proc/sys/kernel/hostname  
# echo "mydomain" > /proc/sys/kernel/domainname
```

has the same effect as:

```
# hostname "darkstar"  
# domainname "mydomain"
```

Note, however, that the classic `darkstar.frop.org` has the hostname “`darkstar`” and DNS (Internet Domain Name Server) domainname “`frop.org`”, not to be confused with the NIS (Network Information Service) or YP (Yellow Pages) domainname. These two domain names are in general different. For a detailed discussion see the `hostname(1)` man page.

## firmware\_config

See `/driver-api/firmware/fallback-mechanisms`.

The entries in this directory allow the firmware loader helper fallback to be controlled:

- `force_sysfs_fallback`, when set to 1, forces the use of the fallback;
- `ignore_sysfs_fallback`, when set to 1, ignores any fallback.

## ftrace\_dump\_on\_oops

Determines whether `ftrace_dump()` should be called on an oops (or kernel panic). This will output the contents of the ftrace buffers to the console. This is very useful for capturing traces that lead to crashes and outputting them to a serial console.

- |   |   |
|---|---|
| 0 | Disabled (default).                                 |
| 1 | Dump buffers of all CPUs.                           |
| 2 | Dump the buffer of the CPU that triggered the oops. |

## ftrace\_enabled, stack\_tracer\_enabled

See `/trace/ftrace`.

### **hardlockup\_all\_cpu\_backtrace**

This value controls the hard lockup detector behavior when a hard lockup condition is detected as to whether or not to gather further debug information. If enabled, arch-specific all-CPU stack dumping will be initiated.

---

0	Do nothing. This is the default behavior.
1	On detection capture more debug information.

---

### **hardlockup\_panic**

This parameter can be used to control whether the kernel panics when a hard lockup is detected.

---

0	Don't panic on hard lockup.
1	Panic on hard lockup.

---

See *Softlockup detector and hardlockup detector (aka nmi\_watchdog)* for more information. This can also be set using the `nmi_watchdog` kernel parameter.

### **hotplug**

Path for the hotplug policy agent. Default value is “/sbin/hotplug” .

### **hung\_task\_all\_cpu\_backtrace**

If this option is set, the kernel will send an NMI to all CPUs to dump their backtraces when a hung task is detected. This file shows up if CONFIG\_DETECT\_HUNG\_TASK and CONFIG\_SMP are enabled.

0: Won’t show all CPUs backtraces when a hung task is detected. This is the default behavior.

1: Will non-maskably interrupt all CPUs and dump their backtraces when a hung task is detected.

### **hung\_task\_panic**

Controls the kernel’s behavior when a hung task is detected. This file shows up if CONFIG\_DETECT\_HUNG\_TASK is enabled.

---

0	Continue operation. This is the default behavior.
1	Panic immediately.

---

### **hung\_task\_check\_count**

The upper bound on the number of tasks that are checked. This file shows up if CONFIG\_DETECT\_HUNG\_TASK is enabled.

### **hung\_task\_timeout\_secs**

When a task in D state did not get scheduled for more than this value report a warning. This file shows up if CONFIG\_DETECT\_HUNG\_TASK is enabled.

0 means infinite timeout, no checking is done.

Possible values to set are in range {0:LONG\_MAX/HZ}.

### **hung\_task\_check\_interval\_secs**

Hung task check interval. If hung task checking is enabled (see [hung\\_task\\_timeout\\_secs](#)), the check is done every hung\_task\_check\_interval\_secs seconds. This file shows up if CONFIG\_DETECT\_HUNG\_TASK is enabled.

0 (default) means use hung\_task\_timeout\_secs as checking interval.

Possible values to set are in range {0:LONG\_MAX/HZ}.

### **hung\_task\_warnings**

The maximum number of warnings to report. During a check interval if a hung task is detected, this value is decreased by 1. When this value reaches 0, no more warnings will be reported. This file shows up if CONFIG\_DETECT\_HUNG\_TASK is enabled.

-1: report an infinite number of warnings.

### **hyperv\_record\_panic\_msg**

Controls whether the panic kmsg data should be reported to Hyper-V.

0	Do not report panic kmsg data.
1	Report the panic kmsg data. This is the default behavior.

## **ignore-unaligned-usertrap**

On architectures where unaligned accesses cause traps, and where this feature is supported (`CONFIG_SYSCTL_ARCH_UNALIGN_NO_WARN`; currently, `arc` and `ia64`), controls whether all unaligned traps are logged.

- 
- |   |  |
|---|--|
| 0 | Log all unaligned accesses.  |
| 1 | Only warn the first time a process traps. This is the default setting. |
- 

See also [\*unaligned-trap\*](#) and [\*unaligned-dump-stack\*](#). On `ia64`, this allows system administrators to override the `IA64_THREAD_UAC_NOPRINT` `prctl` and avoid logs being flooded.

## **kexec\_load\_disabled**

A toggle indicating if the `kexec_load` syscall has been disabled. This value defaults to 0 (false: `kexec_load` enabled), but can be set to 1 (true: `kexec_load` disabled). Once true, `kexec` can no longer be used, and the toggle cannot be set back to false. This allows a `kexec` image to be loaded before disabling the syscall, allowing a system to set up (and later use) an image without it being altered. Generally used together with the [\*modules\\_disabled\*](#) sysctl.

## **kptr\_restrict**

This toggle indicates whether restrictions are placed on exposing kernel addresses via `/proc` and other interfaces.

When `kptr_restrict` is set to 0 (the default) the address is hashed before printing. (This is the equivalent to `%p`.)

When `kptr_restrict` is set to 1, kernel pointers printed using the `%pK` format specifier will be replaced with 0s unless the user has `CAP_SYSLOG` and effective user and group ids are equal to the real ids. This is because `%pK` checks are done at `read()` time rather than `open()` time, so if permissions are elevated between the `open()` and the `read()` (e.g via a setuid binary) then `%pK` will not leak kernel pointers to unprivileged users. Note, this is a temporary solution only. The correct long-term solution is to do the permission checks at `open()` time. Consider removing world read permissions from files that use `%pK`, and using [\*dmesg\\_restrict\*](#) to protect against uses of `%pK` in `dmesg(8)` if leaking kernel pointer values to unprivileged users is a concern.

When `kptr_restrict` is set to 2, kernel pointers printed using `%pK` will be replaced with 0s regardless of privileges.

## modprobe

The full path to the usermode helper for autoloading kernel modules, by default “/sbin/modprobe” . This binary is executed when the kernel requests a module. For example, if userspace passes an unknown filesystem type to `mount()`, then the kernel will automatically request the corresponding filesystem module by executing this usermode helper. This usermode helper should insert the needed module into the kernel.

This sysctl only affects module autoloading. It has no effect on the ability to explicitly insert modules.

This sysctl can be used to debug module loading requests:

```
echo '#! /bin/sh' > /tmp/modprobe
echo 'echo "$@" >> /tmp/modprobe.log' >> /tmp/modprobe
echo 'exec /sbin/modprobe "$@"' >> /tmp/modprobe
chmod a+x /tmp/modprobe
echo /tmp/modprobe > /proc/sys/kernel/modprobe
```

Alternatively, if this sysctl is set to the empty string, then module autoloading is completely disabled. The kernel will not try to execute a usermode helper at all, nor will it call the `kernel_module_request` LSM hook.

If `CONFIG_STATIC_USERMODEHELPER=y` is set in the kernel configuration, then the configured static usermode helper overrides this sysctl, except that the empty string is still accepted to completely disable module autoloading as described above.

## modules\_disabled

A toggle value indicating if modules are allowed to be loaded in an otherwise modular kernel. This toggle defaults to off (0), but can be set true (1). Once true, modules can be neither loaded nor unloaded, and the toggle cannot be set back to false. Generally used with the `kexec_load_disabled` toggle.

## msgmax, msgmnb, and msgmni

`msgmax` is the maximum size of an IPC message, in bytes. 8192 by default (`MSGMAX`).

`msgmnb` is the maximum size of an IPC queue, in bytes. 16384 by default (`MSGMNB`).

`msgmni` is the maximum number of IPC queues. 32000 by default (`MSGMNI`).

### **msg\_next\_id, sem\_next\_id, and shm\_next\_id (System V IPC)**

These three toggles allows to specify desired id for next allocated IPC object: message, semaphore or shared memory respectively.

By default they are equal to -1, which means generic allocation logic. Possible values to set are in range {0:INT\_MAX}.

#### **Notes:**

- 1) kernel doesn't guarantee, that new object will have desired id. So, it's up to userspace, how to handle an object with "wrong" id.
- 2) Toggle with non-default value will be set back to -1 by kernel after successful IPC object allocation. If an IPC object allocation syscall fails, it is undefined if the value remains unmodified or is reset to -1.

### **ngroups\_max**

Maximum number of supplementary groups, *i.e.* the maximum size which setgroups will accept. Exports NGROUPS\_MAX from the kernel.

### **nmi\_watchdog**

This parameter can be used to control the NMI watchdog (*i.e.* the hard lockup detector) on x86 systems.

0	Disable the hard lockup detector.
1	Enable the hard lockup detector.

The hard lockup detector monitors each CPU for its ability to respond to timer interrupts. The mechanism utilizes CPU performance counter registers that are programmed to generate Non-Maskable Interrupts (NMIs) periodically while a CPU is busy. Hence, the alternative name 'NMI watchdog' .

The NMI watchdog is disabled by default if the kernel is running as a guest in a KVM virtual machine. This default can be overridden by adding:

```
nmi_watchdog=1
```

to the guest kernel command line (see *The kernel's command-line parameters*).

## **numa\_balancing**

Enables/disables automatic page fault based NUMA memory balancing. Memory is moved automatically to nodes that access it often.

Enables/disables automatic NUMA memory balancing. On NUMA machines, there is a performance penalty if remote memory is accessed by a CPU. When this feature is enabled the kernel samples what task thread is accessing memory by periodically unmapping pages and later trapping a page fault. At the time of the page fault, it is determined if the data being accessed should be migrated to a local memory node.

The unmapping of pages and trapping faults incur additional overhead that ideally is offset by improved memory locality but there is no universal guarantee. If the target workload is already bound to NUMA nodes then this feature should be disabled. Otherwise, if the system overhead from the feature is too high then the rate the kernel samples for NUMA hinting faults may be controlled by the `numa_balancing_scan_period_min_ms`, `numa_balancing_scan_delay_ms`, `numa_balancing_scan_period_max_ms`, `numa_balancing_scan_size_mb`, and `numa_balancing_settle_count` sysctls.

### **numa\_balancing\_scan\_period\_min\_ms, numa\_balancing\_scan\_delay\_ms, numa\_balancing\_scan\_period\_max\_ms, numa\_balancing\_scan\_size\_mb**

Automatic NUMA balancing scans tasks address space and unmaps pages to detect if pages are properly placed or if the data should be migrated to a memory node local to where the task is running. Every “scan delay” the task scans the next “scan size” number of pages in its address space. When the end of the address space is reached the scanner restarts from the beginning.

In combination, the “scan delay” and “scan size” determine the scan rate. When “scan delay” decreases, the scan rate increases. The scan delay and hence the scan rate of every task is adaptive and depends on historical behaviour. If pages are properly placed then the scan delay increases, otherwise the scan delay decreases. The “scan size” is not adaptive but the higher the “scan size”, the higher the scan rate.

Higher scan rates incur higher system overhead as page faults must be trapped and potentially data must be migrated. However, the higher the scan rate, the more quickly a tasks memory is migrated to a local node if the workload pattern changes and minimises performance impact due to remote memory accesses. These sysctls control the thresholds for scan delays and the number of pages scanned.

`numa_balancing_scan_period_min_ms` is the minimum time in milliseconds to scan a tasks virtual memory. It effectively controls the maximum scanning rate for each task.

`numa_balancing_scan_delay_ms` is the starting “scan delay” used for a task when it initially forks.

`numa_balancing_scan_period_max_ms` is the maximum time in milliseconds to scan a tasks virtual memory. It effectively controls the minimum scanning rate for each task.

`numa_balancing_scan_size_mb` is how many megabytes worth of pages are scanned for a given scan.

### **oops\_all\_cpu\_backtrace**

If this option is set, the kernel will send an NMI to all CPUs to dump their backtraces when an oops event occurs. It should be used as a last resort in case a panic cannot be triggered (to protect VMs running, for example) or kdump can't be collected. This file shows up if CONFIG\_SMP is enabled.

0: Won't show all CPUs backtraces when an oops is detected. This is the default behavior.

1: Will non-maskably interrupt all CPUs and dump their backtraces when an oops event is detected.

### **oops\_limit**

Number of kernel oopses after which the kernel should panic when `panic_on_oops` is not set. Setting this to 0 disables checking the count. Setting this to 1 has the same effect as setting `panic_on_oops=1`. The default value is 10000.

### **osrelease, ostype & version**

```
# cat osrelease
2.1.88
# cat ostype
Linux
# cat version
#5 Wed Feb 25 21:49:24 MET 1998
```

The files `osrelease` and `ostype` should be clear enough. `version` needs a little more clarification however. The '#5' means that this is the fifth kernel built from this source base and the date behind it indicates the time the kernel was built. The only way to tune these values is to rebuild the kernel :-)

### **overflowgid & overflowuid**

if your architecture did not always support 32-bit UIDs (i.e. arm, i386, m68k, sh, and sparc32), a fixed UID and GID will be returned to applications that use the old 16-bit UID/GID system calls, if the actual UID or GID would exceed 65535.

These sysctls allow you to change the value of the fixed UID and GID. The default is 65534.

## panic

The value in this file determines the behaviour of the kernel on a panic:

- if zero, the kernel will loop forever;
- if negative, the kernel will reboot immediately;
- if positive, the kernel will reboot after the corresponding number of seconds.

When you use the software watchdog, the recommended setting is 60.

## panic\_on\_io\_nmi

Controls the kernel's behavior when a CPU receives an NMI caused by an IO error.

0	Try to continue operation (default).
1	Panic immediately. The IO error triggered an NMI. This indicates a serious system condition which could result in IO data corruption. Rather than continuing, panicking might be a better choice. Some servers issue this sort of NMI when the dump button is pushed, and you can use this option to take a crash dump.

## panic\_on\_oops

Controls the kernel's behaviour when an oops or BUG is encountered.

0	Try to continue operation.
1	Panic immediately. If the <i>panic</i> sysctl is also non-zero then the machine will be rebooted.

## panic\_on\_stackoverflow

Controls the kernel's behavior when detecting the overflows of kernel, IRQ and exception stacks except a user stack. This file shows up if CONFIG\_DEBUG\_STACKOVERFLOW is enabled.

0	Try to continue operation.
1	Panic immediately.

### **panic\_on\_unrecovered\_nmi**

The default Linux behaviour on an NMI of either memory or unknown is to continue operation. For many environments such as scientific computing it is preferable that the box is taken out and the error dealt with than an uncorrected parity/ECC error get propagated.

A small number of systems do generate NMIs for bizarre random reasons such as power management so the default is off. That sysctl works like the existing panic controls already in that directory.

### **panic\_on\_warn**

Calls panic() in the WARN() path when set to 1. This is useful to avoid a kernel rebuild when attempting to kdump at the location of a WARN().

- |   |  |
|---|--|
| 0 | Only WARN(), default behaviour.                  |
| 1 | Call panic() after printing out WARN() location. |

### **panic\_print**

Bitmask for printing system info when panic happens. User can chose combination of the following bits:

- |       |  |
|-------|--|
| bit 0 | print all tasks info                     |
| bit 1 | print system memory info                 |
| bit 2 | print timer info                         |
| bit 3 | print locks info if CONFIG_LOCKDEP is on |
| bit 4 | print ftrace buffer                      |
| bit 5 | print all printk messages in buffer      |

So for example to print tasks and memory info on panic, user can:

```
echo 3 > /proc/sys/kernel/panic_print
```

### **panic\_on\_rcu\_stall**

When set to 1, calls panic() after RCU stall detection messages. This is useful to define the root cause of RCU stalls using a vmcore.

- |   |  |
|---|--|
| 0 | Do not panic() when RCU stall takes place, default behavior. |
| 1 | panic() after printing RCU stall messages.                   |

## **perf\_cpu\_time\_max\_percent**

Hints to the kernel how much CPU time it should be allowed to use to handle perf sampling events. If the perf subsystem is informed that its samples are exceeding this limit, it will drop its sampling frequency to attempt to reduce its CPU usage.

Some perf sampling happens in NMIs. If these samples unexpectedly take too long to execute, the NMIs can become stacked up next to each other so much that nothing else is allowed to execute.

- 
- |     |   |
|-----|---|
| 0   | Disable the mechanism. Do not monitor or correct perf' s sampling rate no matter how CPU time it takes.   |
| 1-  | Attempt to throttle perf' s sample rate to this percentage of CPU. Note: the  |
| 100 | kernel calculates an “expected” length of each sample event. 100 here means 100% of that expected length. Even if this is set to 100, you may still see sample throttling if this length is exceeded. Set to 0 if you truly do not care how much CPU is consumed. |
- 

## **perf\_event\_paranoid**

Controls use of the performance events system by unprivileged users (without CAP\_PERFMON). The default value is 2.

For backward compatibility reasons access to system performance monitoring and observability remains open for CAP\_SYS\_ADMIN privileged processes but CAP\_SYS\_ADMIN usage for secure system performance monitoring and observability operations is discouraged with respect to CAP\_PERFMON use cases.

- 
- |     |   |
|-----|---|
| -1  | Allow use of (almost) all events by all users.<br>Ignore mlock limit after perf_event_mlock_kb without CAP_IPC_LOCK.              |
| >=0 | Disallow ftrace function tracepoint by users without CAP_PERFMON.<br>Disallow raw tracepoint access by users without CAP_PERFMON. |
| >=1 | Disallow CPU event access by users without CAP_PERFMON.   |
| >=2 | Disallow kernel profiling by users without CAP_PERFMON.   |
- 

## **perf\_event\_max\_stack**

Controls maximum number of stack frames to copy for (attr.sample\_type & PERF\_SAMPLE\_CALLCHAIN) configured events, for instance, when using ‘perf record -g’ or ‘perf trace --call-graph fp’ .

This can only be done when no events are in use that have callchains enabled, otherwise writing to this file will return -EBUSY.

The default value is 127.

### **perf\_event\_mlock\_kb**

Control size of per-cpu ring buffer not counted against mlock limit.

The default value is 512 + 1 page

### **perf\_event\_max\_contexts\_per\_stack**

Controls maximum number of stack frame context entries for (`attr.sample_type & PERF_SAMPLE_CALLCHAIN`) configured events, for instance, when using ‘`perf record -g`’ or ‘`perf trace --call-graph fp`’ .

This can only be done when no events are in use that have callchains enabled, otherwise writing to this file will return -EBUSY.

The default value is 8.

### **pid\_max**

PID allocation wrap value. When the kernel’s next PID value reaches this value, it wraps back to a minimum PID value. PIDs of value `pid_max` or larger are not allocated.

### **ns\_last\_pid**

The last pid allocated in the current (the one task using this sysctl lives in) pid namespace. When selecting a pid for a next task on fork kernel tries to allocate a number starting from this one.

### **powersave-nap (PPC only)**

If set, Linux-PPC will use the ‘nap’ mode of powersaving, otherwise the ‘doze’ mode will be used.

---

### **printk**

The four values in `printk` denote: `console_loglevel`, `default_message_loglevel`, `minimum_console_loglevel` and `default_console_loglevel` respectively.

These values influence `printk()` behavior when printing or logging error messages. See ‘`man 2 syslog`’ for more info on the different loglevels.

console_loglevel	messages with a higher priority than this will be printed to the console
de-fault_message_loglevel	messages without an explicit priority will be printed with this priority
minimum_console_loglevel	minimum (highest) value to which console_loglevel can be set
default_console_loglevel	default value for console_loglevel

### **printk\_delay**

Delay each printk message in `printk_delay` milliseconds

Value from 0 - 10000 is allowed.

### **printk\_ratelimit**

Some warning messages are rate limited. `printk_ratelimit` specifies the minimum length of time between these messages (in seconds). The default value is 5 seconds.

A value of 0 will disable rate limiting.

### **printk\_ratelimit\_burst**

While long term we enforce one message per `printk_ratelimit` seconds, we do allow a burst of messages to pass through. `printk_ratelimit_burst` specifies the number of messages we can send before ratelimiting kicks in.

The default value is 10 messages.

### **printk\_devkmsg**

Control the logging to `/dev/kmsg` from userspace:

ratelimit	default, ratelimited
on	unlimited logging to <code>/dev/kmsg</code> from userspace
off	logging to <code>/dev/kmsg</code> disabled

The kernel command line parameter `printk.devkmsg=` overrides this and is a one-time setting until next reboot: once set, it cannot be changed by this sysctl interface anymore.

### pty

See Documentation/filesystems/devpts.rst.

### random

This is a directory, with the following entries:

- `boot_id`: a UUID generated the first time this is retrieved, and unvarying after that;
- `uuid`: a UUID generated every time this is retrieved (this can thus be used to generate UUIDs at will);
- `entropy_avail`: the pool's entropy count, in bits;
- `poolsizе`: the entropy pool size, in bits;
- `urandom_min_reseed_secs`: obsolete (used to determine the minimum number of seconds between urandom pool reseeding). This file is writable for compatibility purposes, but writing to it has no effect on any RNG behavior;
- `write_wakeup_threshold`: when the entropy count drops below this (as a number of bits), processes waiting to write to /dev/random are woken up. This file is writable for compatibility purposes, but writing to it has no effect on any RNG behavior.

### randomize\_va\_space

This option can be used to select the type of process address space randomization that is used in the system, for architectures that support this feature.

- |   |  |
|---|--|
| 0 | Turn the process address space randomization off. This is the default for architectures that do not support this feature anyways, and kernels that are booted with the “norandmaps” parameter.   |
| 1 | Make the addresses of mmap base, stack and VDSO page randomized. This, among other things, implies that shared libraries will be loaded to random addresses. Also for PIE-linked binaries, the location of code start is randomized. This is the default if the <code>CONFIG_COMPAT_BRK</code> option is enabled.  |
| 2 | Additionally enable heap randomization. This is the default if <code>CONFIG_COMPAT_BRK</code> is disabled.<br>There are a few legacy applications out there (such as some ancient versions of libc.so.5 from 1996) that assume that brk area starts just after the end of the code+bss. These applications break when start of the brk area is randomized. There are however no known non-legacy applications that would be broken this way, so for most systems it is safe to choose full randomization.<br>Systems with ancient and/or broken binaries should be configured with <code>CONFIG_COMPAT_BRK</code> enabled, which excludes the heap from process address space randomization. |

**real-root-dev**

See [Using the initial RAM disk \(initrd\)](#).

**reboot-cmd (SPARC only)**

??? This seems to be a way to give an argument to the Sparc ROM/Flash boot loader. Maybe to tell it what to do after rebooting. ???

**sched\_energy\_aware**

Enables/disables Energy Aware Scheduling (EAS). EAS starts automatically on platforms where it can run (that is, platforms with asymmetric CPU topologies and having an Energy Model available). If your platform happens to meet the requirements for EAS but you do not want to use it, change this value to 0.

**sched\_schedstats**

Enables/disables scheduler statistics. Enabling this feature incurs a small amount of overhead in the scheduler but is useful for debugging and performance tuning.

**sched\_util\_clamp\_min:**

Max allowed *minimum* utilization.

Default value is 1024, which is the maximum possible value.

It means that any requested uclamp.min value cannot be greater than sched\_util\_clamp\_min, i.e., it is restricted to the range [0:sched\_util\_clamp\_min].

**sched\_util\_clamp\_max:**

Max allowed *maximum* utilization.

Default value is 1024, which is the maximum possible value.

It means that any requested uclamp.max value cannot be greater than sched\_util\_clamp\_max, i.e., it is restricted to the range [0:sched\_util\_clamp\_max].

**sched\_util\_clamp\_min\_rt\_default:**

By default Linux is tuned for performance. Which means that RT tasks always run at the highest frequency and most capable (highest capacity) CPU (in heterogeneous systems).

Uclamp achieves this by setting the requested uclamp.min of all RT tasks to 1024 by default, which effectively boosts the tasks to run at the highest frequency and biases them to run on the biggest CPU.

This knob allows admins to change the default behavior when uclamp is being used. In battery powered devices particularly, running at the maximum capacity and frequency will increase energy consumption and shorten the battery life.

This knob is only effective for RT tasks which the user hasn't modified their requested uclamp.min value via sched\_setattr() syscall.

This knob will not escape the range constraint imposed by sched\_util\_clamp\_min defined above.

For example if

```
sched_util_clamp_min_rt_default = 800 sched_util_clamp_min = 600
```

Then the boost will be clamped to 600 because 800 is outside of the permissible range of [0:600]. This could happen for instance if a powersave mode will restrict all boosts temporarily by modifying sched\_util\_clamp\_min. As soon as this restriction is lifted, the requested sched\_util\_clamp\_min\_rt\_default will take effect.

### **seccomp**

See /userspace-api/seccomp\_filter.

### **sg-big-buff**

This file shows the size of the generic SCSI (sg) buffer. You can't tune it just yet, but you could change it on compile time by editing include/scsi/sg.h and changing the value of SG\_BIG\_BUFF.

There shouldn't be any reason to change this value. If you can come up with one, you probably know what you are doing anyway :)

### **shmall**

This parameter sets the total amount of shared memory pages that can be used system wide. Hence, shmall should always be at least ceil(shmmmax/PAGE\_SIZE).

If you are not sure what the default PAGE\_SIZE is on your Linux system, you can run the following command:

```
# getconf PAGE_SIZE
```

### **shmmmax**

This value can be used to query and set the run time limit on the maximum shared memory segment size that can be created. Shared memory segments up to 1Gb are now supported in the kernel. This value defaults to SHMMAX.

## shmmni

This value determines the maximum number of shared memory segments. 4096 by default (SHMMNI).

## shm\_rmid\_forced

Linux lets you set resource limits, including how much memory one process can consume, via `setrlimit(2)`. Unfortunately, shared memory segments are allowed to exist without association with any process, and thus might not be counted against any resource limits. If enabled, shared memory segments are automatically destroyed when their attach count becomes zero after a detach or a process termination. It will also destroy segments that were created, but never attached to, on exit from the process. The only use left for `IPC_RMID` is to immediately destroy an unattached segment. Of course, this breaks the way things are defined, so some applications might stop working. Note that this feature will do you no good unless you also configure your resource limits (in particular, `RLIMIT_AS` and `RLIMIT_NPROC`). Most systems don't need this.

Note that if you change this from 0 to 1, already created segments without users and with a dead originative process will be destroyed.

## sysctl\_writes\_strict

Control how file position affects the behavior of updating sysctl values via the /proc/sys interface:

- |    |   |
|----|---|
| -1 | Legacy per-write sysctl value handling, with no <code>printk</code> warnings. Each write syscall must fully contain the sysctl value to be written, and multiple writes on the same sysctl file descriptor will rewrite the sysctl value, regardless of file position.  |
| 0  | Same behavior as above, but warn about processes that perform writes to a sysctl file descriptor when the file position is not 0.   |
| 1  | (default) Respect file position when writing sysctl strings. Multiple writes will append to the sysctl value buffer. Anything past the max length of the sysctl value buffer will be ignored. Writes to numeric sysctl entries must always be at file position 0 and the value must be fully contained in the buffer sent in the write syscall. |

## softlockup\_all\_cpu\_backtrace

This value controls the soft lockup detector thread's behavior when a soft lockup condition is detected as to whether or not to gather further debug information. If enabled, each cpu will be issued an NMI and instructed to capture stack trace.

This feature is only applicable for architectures which support NMI.

- |   |  |
|---|--|
| 0 | Do nothing. This is the default behavior.    |
| 1 | On detection capture more debug information. |

### **softlockup\_panic**

This parameter can be used to control whether the kernel panics when a soft lockup is detected.

- |   |                             |
|---|-----------------------------|
| 0 | Don't panic on soft lockup. |
| 1 | Panic on soft lockup.       |

This can also be set using the `softlockup_panic` kernel parameter.

### **soft\_watchdog**

This parameter can be used to control the soft lockup detector.

- |   |                                   |
|---|-----------------------------------|
| 0 | Disable the soft lockup detector. |
| 1 | Enable the soft lockup detector.  |

The soft lockup detector monitors CPUs for threads that are hogging the CPUs without rescheduling voluntarily, and thus prevent the ‘watchdog/N’ threads from running. The mechanism depends on the CPUs ability to respond to timer interrupts which are needed for the ‘watchdog/N’ threads to be woken up by the watchdog timer function, otherwise the NMI watchdog —if enabled—can detect a hard lockup condition.

### **stack\_erasing**

This parameter can be used to control kernel stack erasing at the end of syscalls for kernels built with `CONFIG_GCC_PLUGIN_STACKLEAK`.

That erasing reduces the information which kernel stack leak bugs can reveal and blocks some uninitialized stack variable attacks. The tradeoff is the performance impact: on a single CPU system kernel compilation sees a 1% slowdown, other systems and workloads may vary.

- |   |  |
|---|--|
| 0 | Kernel stack erasing is disabled, <code>STACKLEAK_METRICS</code> are not updated.                                    |
| 1 | Kernel stack erasing is enabled (default), it is performed before returning to the userspace at the end of syscalls. |

### **stop-a (SPARC only)**

Controls Stop-A:

- |   |                                      |
|---|--------------------------------------|
| 0 | Stop-A has no effect.                |
| 1 | Stop-A breaks to the PROM (default). |

Stop-A is always enabled on a panic, so that the user can return to the boot PROM.

**sysrq**

See *Linux Magic System Request Key Hacks*.

**tainted**

Non-zero if the kernel has been tainted. Numeric values, which can be ORed together. The letters are seen in “Tainted” line of Oops reports.

1	(P)	proprietary module was loaded
2	(F)	module was force loaded
4	(S)	SMP kernel oops on an officially SMP incapable processor
8	(R)	module was force unloaded
16	(M)	processor reported a Machine Check Exception (MCE)
32	(B)	bad page referenced or some unexpected page flags
64	(U)	taint requested by userspace application
128	(D)	kernel died recently, i.e. there was an OOPS or BUG
256	(A)	an ACPI table was overridden by user
512	(W)	kernel issued warning
1024	(C)	staging driver was loaded
2048	(I)	workaround for bug in platform firmware applied
4096	(O)	externally-built (“out-of-tree”) module was loaded
8192	(E)	unsigned module was loaded
16384	(L)	soft lockup occurred
32768	(K)	kernel has been live patched
65536	(X)	Auxiliary taint, defined and used by for distros
131072	(T)	The kernel was built with the struct randomization plugin

See *Tainted kernels* for more information.

**Note:**

writes to this sysctl interface will fail with EINVAL if the kernel is booted with the command line option `panic_on_taint=<bitmask>`, `nousertaint` and any of the ORed together values being written to `tainted` match with the bitmask declared on `panic_on_taint`. See *The kernel’s command-line parameters* for more details on that particular kernel command line option and its optional `nousertaint` switch.

**threads-max**

This value controls the maximum number of threads that can be created using `fork()`.

During initialization the kernel sets this value such that even if the maximum number of threads is created, the thread structures occupy only a part (1/8th) of the available RAM pages.

The minimum value that can be written to `threads-max` is 1.

The maximum value that can be written to `threads-max` is given by the constant `FUTEX_TID_MASK` (0x3fffffff).

If a value outside of this range is written to `threads-max` an EINVAL error occurs.

### **traceoff\_on\_warning**

When set, disables tracing (see `/trace/ftrace`) when a `WARN()` is hit.

### **tracepoint\_printk**

When tracepoints are sent to `printk()` (enabled by the `tp_printk` boot parameter), this entry provides runtime control:

```
echo 0 > /proc/sys/kernel/tracepoint_printk
```

will stop tracepoints from being sent to `printk()`, and:

```
echo 1 > /proc/sys/kernel/tracepoint_printk
```

will send them to `printk()` again.

This only works if the kernel was booted with `tp_printk` enabled.

See [\*The kernel's command-line parameters\*](#) and `/trace/boottime-trace`.

### **unaligned-dump-stack (ia64)**

When logging unaligned accesses, controls whether the stack is dumped.

- 
- |   |   |
|---|---|
| 0 | Do not dump the stack. This is the default setting. |
| 1 | Dump the stack.                                     |
- 

See also [\*ignore-unaligned-usertrap\*](#).

### **unaligned-trap**

On architectures where unaligned accesses cause traps, and where this feature is supported (`CONFIG_SYSCTL_ARCH_UNALIGN_ALLOW`; currently, `arc` and `parisc`), controls whether unaligned traps are caught and emulated (instead of failing).

- 
- |   |  |
|---|--|
| 0 | Do not emulate unaligned accesses.                       |
| 1 | Emulate unaligned accesses. This is the default setting. |
- 

See also [\*ignore-unaligned-usertrap\*](#).

### **unknown\_nmi\_panic**

The value in this file affects behavior of handling NMI. When the value is non-zero, unknown NMI is trapped and then panic occurs. At that time, kernel debugging information is displayed on console.

NMI switch that most IA32 servers have fires unknown NMI up, for example. If a system hangs up, try pressing the NMI switch.

### **unprivileged\_bpf\_disabled**

Writing 1 to this entry will disable unprivileged calls to `bpf()`; once disabled, calling `bpf()` without `CAP_SYS_ADMIN` or `CAP_BPF` will return `-EPERM`. Once set to 1, this can't be cleared from the running kernel anymore.

Writing 2 to this entry will also disable unprivileged calls to `bpf()`, however, an admin can still change this setting later on, if needed, by writing 0 or 1 to this entry.

If `BPF_UNPRIV_DEFAULT_OFF` is enabled in the kernel config, then this entry will default to 2 instead of 0.

0	Unprivileged calls to <code>bpf()</code> are enabled
1	Unprivileged calls to <code>bpf()</code> are disabled without recovery
2	Unprivileged calls to <code>bpf()</code> are disabled

### **warn\_limit**

Number of kernel warnings after which the kernel should panic when `panic_on_warn` is not set. Setting this to 0 disables checking the warning count. Setting this to 1 has the same effect as setting `panic_on_warn=1`. The default value is 0.

### **watchdog**

This parameter can be used to disable or enable the soft lockup detector *and* the NMI watchdog (i.e. the hard lockup detector) at the same time.

0	Disable both lockup detectors.
1	Enable both lockup detectors.

The soft lockup detector and the NMI watchdog can also be disabled or enabled individually, using the `soft_watchdog` and `nmi_watchdog` parameters. If the `watchdog` parameter is read, for example by executing:

```
cat /proc/sys/kernel/watchdog
```

the output of this command (0 or 1) shows the logical OR of `soft_watchdog` and `nmi_watchdog`.

### **watchdog\_cpumask**

This value can be used to control on which cpus the watchdog may run. The default cpumask is all possible cores, but if NO\_HZ\_FULL is enabled in the kernel config, and cores are specified with the nohz\_full= boot argument, those cores are excluded by default. Offline cores can be included in this mask, and if the core is later brought online, the watchdog will be started based on the mask value.

Typically this value would only be touched in the nohz\_full case to re-enable cores that by default were not running the watchdog, if a kernel lockup was suspected on those cores.

The argument value is the standard cpulist format for cpumasks, so for example to enable the watchdog on cores 0, 2, 3, and 4 you might say:

```
echo 0,2-4 > /proc/sys/kernel/watchdog_cpumask
```

### **watchdog\_thresh**

This value can be used to control the frequency of hrtimer and NMI events and the soft and hard lockup thresholds. The default threshold is 10 seconds.

The softlockup threshold is (2 \* watchdog\_thresh). Setting this tunable to zero will disable lockup detection altogether.

---

This file contains the documentation for the sysctl files in /proc/sys/net

The interface to the networking parts of the kernel is located in /proc/sys/net. The following table shows all possible subdirectories. You may see only some of them, depending on your kernel's configuration.

Table : Subdirectories in /proc/sys/net

Directory	Content	Directory	Content
802	E802 protocol	mptcp	Multipath TCP
appletalk	Appletalk protocol	netfilter	Network Filter
ax25	AX25	netrom	NET/ROM
bridge	Bridging	rose	X.25 PLP layer
core	General parameter	tipc	TIPC
ethernet	Ethernet protocol	unix	Unix domain sockets
ipv4	IP version 4	x25	X.25 protocol
ipv6	IP version 6		

## 1. /proc/sys/net/core - Network core options

### bpf\_jit\_enable

This enables the BPF Just in Time (JIT) compiler. BPF is a flexible and efficient infrastructure allowing to execute bytecode at various hook points. It is used in a number of Linux kernel subsystems such as networking (e.g. XDP, tc), tracing (e.g. kprobes, uprobes, tracepoints) and security (e.g. seccomp). LLVM has a BPF back end that can compile restricted C into a sequence of BPF instructions. After program load through bpf(2) and passing a verifier in the kernel, a JIT will then translate these BPF proplets into native CPU instructions. There are two flavors of JITs, the newer eBPF JIT currently supported on:

- x86\_64
- x86\_32
- arm64
- arm32
- ppc64
- sparc64
- mips64
- s390x
- riscv64
- riscv32

And the older cBPF JIT supported on the following archs:

- mips
- ppc
- sparc

eBPF JITs are a superset of cBPF JITs, meaning the kernel will migrate cBPF instructions into eBPF instructions and then JIT compile them transparently. Older cBPF JITs can only translate tcpdump filters, seccomp rules, etc, but not mentioned eBPF programs loaded through bpf(2).

Values:

- 0 - disable the JIT (default value)
- 1 - enable the JIT
- 2 - enable the JIT and ask the compiler to emit traces on kernel log.

### **bpf\_jit\_harden**

This enables hardening for the BPF JIT compiler. Supported are eBPF JIT backends. Enabling hardening trades off performance, but can mitigate JIT spraying.

Values:

- 0 - disable JIT hardening (default value)
- 1 - enable JIT hardening for unprivileged users only
- 2 - enable JIT hardening for all users

### **bpf\_jit\_kallsyms**

When BPF JIT compiler is enabled, then compiled images are unknown addresses to the kernel, meaning they neither show up in traces nor in /proc/kallsyms. This enables export of these addresses, which can be used for debugging/tracing. If bpf\_jit\_harden is enabled, this feature is disabled.

Values :

- 0 - disable JIT kallsyms export (default value)
- 1 - enable JIT kallsyms export for privileged users only

### **bpf\_jit\_limit**

This enforces a global limit for memory allocations to the BPF JIT compiler in order to reject unprivileged JIT requests once it has been surpassed. bpf\_jit\_limit contains the value of the global limit in bytes.

### **dev\_weight**

The maximum number of packets that kernel can handle on a NAPI interrupt, it's a Per-CPU variable. For drivers that support LRO or GRO\_HW, a hardware aggregated packet is counted as one packet in this context.

Default: 64

### **dev\_weight\_rx\_bias**

RPS (e.g. RFS, aRFS) processing is competing with the registered NAPI poll function of the driver for the per softirq cycle netdev\_budget. This parameter influences the proportion of the configured netdev\_budget that is spent on RPS based packet processing during RX softirq cycles. It is further meant for making current dev\_weight adaptable for asymmetric CPU needs on RX/TX side of the network stack. (see dev\_weight\_tx\_bias) It is effective on a per CPU basis. Determination is based on dev\_weight and is calculated multiplicative (dev\_weight \* dev\_weight\_rx\_bias).

Default: 1

### **dev\_weight\_tx\_bias**

Scales the maximum number of packets that can be processed during a TX softirq cycle. Effective on a per CPU basis. Allows scaling of current dev\_weight for asymmetric net stack processing needs. Be careful to avoid making TX softirq processing a CPU hog.

Calculation is based on dev\_weight (dev\_weight \* dev\_weight\_tx\_bias).

Default: 1

### **default\_qdisc**

The default queuing discipline to use for network devices. This allows overriding the default of pfifo\_fast with an alternative. Since the default queuing discipline is created without additional parameters so is best suited to queuing disciplines that work well without configuration like stochastic fair queue (sfq), CoDel (codel) or fair queue CoDel (fq\_codel). Don't use queuing disciplines like Hierarchical Token Bucket or Deficit Round Robin which require setting up classes and bandwidths. Note that physical multiqueue interfaces still use mq as root qdisc, which in turn uses this default for its leaves. Virtual devices (like e.g. lo or veth) ignore this setting and instead default to noqueue.

Default: pfifo\_fast

### **busy\_read**

Low latency busy poll timeout for socket reads. (needs CONFIG\_NET\_RX\_BUSY\_POLL) Approximate time in us to busy loop waiting for packets on the device queue. This sets the default value of the SO\_BUSY\_POLL socket option. Can be set or overridden per socket by setting socket option SO\_BUSY\_POLL, which is the preferred method of enabling. If you need to enable the feature globally via sysctl, a value of 50 is recommended.

Will increase power usage.

Default: 0 (off)

### **busy\_poll**

Low latency busy poll timeout for poll and select. (needs CONFIG\_NET\_RX\_BUSY\_POLL) Approximate time in us to busy loop waiting for events. Recommended value depends on the number of sockets you poll on. For several sockets 50, for several hundreds 100. For more than that you probably want to use epoll. Note that only sockets with SO\_BUSY\_POLL set will be busy polled, so you want to either selectively set SO\_BUSY\_POLL on those sockets or set sysctl.net.busy\_read globally.

Will increase power usage.

Default: 0 (off)

### **rmem\_default**

The default setting of the socket receive buffer in bytes.

### **rmem\_max**

The maximum receive socket buffer size in bytes.

### **tstamp\_allow\_data**

Allow processes to receive tx timestamps looped together with the original packet contents. If disabled, transmit timestamp requests from unprivileged processes are dropped unless socket option SOF\_TIMESTAMPING\_OPT\_TSONLY is set.

Default: 1 (on)

### **wmem\_default**

The default setting (in bytes) of the socket send buffer.

### **wmem\_max**

The maximum send socket buffer size in bytes.

### **message\_burst and message\_cost**

These parameters are used to limit the warning messages written to the kernel log from the networking code. They enforce a rate limit to make a denial-of-service attack impossible. A higher message\_cost factor, results in fewer messages that will be written. Message\_burst controls when messages will be dropped. The default settings limit warning messages to one every five seconds.

## warnings

This sysctl is now unused.

This was used to control console messages from the networking stack that occur because of problems on the network like duplicate address or bad checksums.

These messages are now emitted at KERN\_DEBUG and can generally be enabled and controlled by the dynamic\_debug facility.

## **netdev\_budget**

Maximum number of packets taken from all interfaces in one polling cycle (NAPI poll). In one polling cycle interfaces which are registered to polling are probed in a round-robin manner. Also, a polling cycle may not exceed netdev\_budget\_usecs microseconds, even if netdev\_budget has not been exhausted.

## **netdev\_budget\_usecs**

Maximum number of microseconds in one NAPI polling cycle. Polling will exit when either netdev\_budget\_usecs have elapsed during the poll cycle or the number of packets processed reaches netdev\_budget.

## **netdev\_max\_backlog**

Maximum number of packets, queued on the INPUT side, when the interface receives packets faster than kernel can process them.

## **netdev\_rss\_key**

RSS (Receive Side Scaling) enabled drivers use a 40 bytes host key that is randomly generated. Some user space might need to gather its content even if drivers do not provide ethtool -x support yet.

```
myhost:~# cat /proc/sys/net/core/netdev_rss_key
84:50:f4:00:a8:15:d1:a7:e9:7f:1d:60:35:c7:47:25:42:97:74:ca:56:bb:b6:a1:d8:u
↪... (52 bytes total)
```

File contains nul bytes if no driver ever called netdev\_rss\_key\_fill() function.

### **Note:**

/proc/sys/net/core/netdev\_rss\_key contains 52 bytes of key, but most drivers only use 40 bytes of it.

```
myhost:~# ethtool -x eth0
RX flow hash indirection table for eth0 with 8 RX ring(s):
 0:   0    1    2    3    4    5    6    7
RSS hash key:
84:50:f4:00:a8:15:d1:a7:e9:7f:1d:60:35:c7:47:25:42:97:74:ca:56:bb:b6:a1:d8:43:e3
```

### **`netdev_tstamp_prequeue`**

If set to 0, RX packet timestamps can be sampled after RPS processing, when the target CPU processes packets. It might give some delay on timestamps, but permit to distribute the load on several cpus.

If set to 1 (default), timestamps are sampled as soon as possible, before queueing.

### **`optmem_max`**

Maximum ancillary buffer size allowed per socket. Ancillary data is a sequence of struct cmsghdr structures with appended data.

### **`fb_tunnels_only_for_init_net`**

Controls if fallback tunnels (like tunl0, gre0, gretap0, erspan0, sit0, ip6tnl0, ip6gre0) are automatically created. There are 3 possibilities (a) value = 0; respective fallback tunnels are created when module is loaded in every net namespaces (backward compatible behavior). (b) value = 1; [kcmd value: initns] respective fallback tunnels are created only in init net namespace and every other net namespace will not have them. (c) value = 2; [kcmd value: none] fallback tunnels are not created when a module is loaded in any of the net namespaces. Setting value to “2” is pointless after boot if these modules are built-in, so there is a kernel command-line option that can change this default. Please refer to *The kernel’s command-line parameters* for additional details.

Not creating fallback tunnels gives control to userspace to create whatever is needed only and avoid creating devices which are redundant.

Default : 0 (for compatibility reasons)

### **`devconf_inherit_init_net`**

Controls if a new network namespace should inherit all current settings under /proc/sys/net/{ipv4,ipv6}/conf/{all,default}/. By default, we keep the current behavior: for IPv4 we inherit all current settings from init\_net and for IPv6 we reset all settings to default.

If set to 1, both IPv4 and IPv6 settings are forced to inherit from current ones in init\_net. If set to 2, both IPv4 and IPv6 settings are forced to reset to their default values. If set to 3, both IPv4 and IPv6 settings are forced to inherit from current ones in the netns where this new netns has been created.

Default : 0 (for compatibility reasons)

### **2. /proc/sys/net/unix - Parameters for Unix domain sockets**

There is only one file in this directory. `unix_dgram_qlen` limits the max number of datagrams queued in Unix domain socket's buffer. It will not take effect unless `PF_UNIX` flag is specified.

### **3. /proc/sys/net/ipv4 - IPV4 settings**

Please see: [Documentation/networking/ip-sysctl.rst](#) and [\*Documentation for /proc/sys/net/\*](#) for descriptions of these entries.

## **4. Appletalk**

The `/proc/sys/net/appletalk` directory holds the Appletalk configuration data when Appletalk is loaded. The configurable parameters are:

### **aarp-expiry-time**

The amount of time we keep an ARP entry before expiring it. Used to age out old hosts.

### **aarp-resolve-time**

The amount of time we will spend trying to resolve an Appletalk address.

### **aarp-retransmit-limit**

The number of times we will retransmit a query before giving up.

### **aarp-tick-time**

Controls the rate at which expires are checked.

The directory `/proc/net/appletalk` holds the list of active Appletalk sockets on a machine.

The fields indicate the DDP type, the local address (in network:node format) the remote address, the size of the transmit pending queue, the size of the received queue (bytes waiting for applications to read) the state and the uid owning the socket.

`/proc/net/atalk_iface` lists all the interfaces configured for appletalk. It shows the name of the interface, its Appletalk address, the network range on that address (or network number for phase 1 networks), and the status of the interface.

`/proc/net/atalk_route` lists each known network route. It lists the target (network) that the route leads to, the router (may be directly connected), the route flags, and the device the route is using.

### 5. TIPC

#### **tipc\_rmem**

The TIPC protocol now has a tunable for the receive memory, similar to the `tcp_rmem` - i.e. a vector of 3 `INTEGER`s: (min, default, max)

```
# cat /proc/sys/net/tipc/tipc_rmem
4252725 34021800      68043600
#
```

The max value is set to `CONN_OVERLOAD_LIMIT`, and the default and min values are scaled (shifted) versions of that same value. Note that the min value is not at this point in time used in any meaningful way, but the triplet is preserved in order to be consistent with things like `tcp_rmem`.

#### **named\_timeout**

TIPC name table updates are distributed asynchronously in a cluster, without any form of transaction handling. This means that different race scenarios are possible. One such is that a name withdrawal sent out by one node and received by another node may arrive after a second, overlapping name publication already has been accepted from a third node, although the conflicting updates originally may have been issued in the correct sequential order. If `named_timeout` is nonzero, failed topology updates will be placed on a defer queue until another event arrives that clears the error, or until the timeout expires. Value is in milliseconds.

### 4.1.5 Documentation for `/proc/sys/sunrpc/`

kernel version 2.2.10

Copyright (c) 1998, 1999, Rik van Riel <[riel@nl.linux.org](mailto:riel@nl.linux.org)>

For general info and legal blurb, please look in `index.rst`.

---

This file contains the documentation for the `sysctl` files in `/proc/sys/sunrpc` and is valid for Linux kernel version 2.2.

The files in this directory can be used to (re)set the debug flags of the SUN Remote Procedure Call (RPC) subsystem in the Linux kernel. This stuff is used for NFS, KNFSD and maybe a few other things as well.

The files in there are used to control the debugging flags: `rpc_debug`, `nfs_debug`, `nfsd_debug` and `nlm_debug`.

These flags are for kernel hackers only. You should read the source code in `net/sunrpc/` for more information.

#### **4.1.6 Documentation for /proc/sys/user/**

kernel version 4.9.0

Copyright (c) 2016 Eric Biederman <[ebiederm@xmission.com](mailto:ebiederm@xmission.com)>

---

This file contains the documentation for the sysctl files in /proc/sys/user.

The files in this directory can be used to override the default limits on the number of namespaces and other objects that have per user per user namespace limits.

The primary purpose of these limits is to stop programs that malfunction and attempt to create a ridiculous number of objects, before the malfunction becomes a system wide problem. It is the intention that the defaults of these limits are set high enough that no program in normal operation should run into these limits.

The creation of per user per user namespace objects are charged to the user in the user namespace who created the object and verified to be below the per user limit in that user namespace.

The creation of objects is also charged to all of the users who created user namespaces the creation of the object happens in (user namespaces can be nested) and verified to be below the per user limits in the user namespaces of those users.

This recursive counting of created objects ensures that creating a user namespace does not allow a user to escape their current limits.

Currently, these files are in /proc/sys/user:

##### **max\_cgroup\_namespaces**

The maximum number of cgroup namespaces that any user in the current user namespace may create.

##### **max\_ipc\_namespaces**

The maximum number of ipc namespaces that any user in the current user namespace may create.

##### **max\_mnt\_namespaces**

The maximum number of mount namespaces that any user in the current user namespace may create.

### **max\_net\_namespaces**

The maximum number of network namespaces that any user in the current user namespace may create.

### **max\_pid\_namespaces**

The maximum number of pid namespaces that any user in the current user namespace may create.

### **max\_time\_namespaces**

The maximum number of time namespaces that any user in the current user namespace may create.

### **max\_user\_namespaces**

The maximum number of user namespaces that any user in the current user namespace may create.

### **max\_uts\_namespaces**

The maximum number of user namespaces that any user in the current user namespace may create.

## **4.1.7 Documentation for /proc/sys/vm/**

kernel version 2.6.29

Copyright (c) 1998, 1999, Rik van Riel <riel@nl.linux.org>

Copyright (c) 2008 Peter W. Morreale <pmorreale@novell.com>

For general info and legal blurb, please look in index.rst.

---

This file contains the documentation for the sysctl files in /proc/sys/vm and is valid for Linux kernel version 2.6.29.

The files in this directory can be used to tune the operation of the virtual memory (VM) subsystem of the Linux kernel and the writeout of dirty data to disk.

Default values and initialization routines for most of these files can be found in mm/swap.c.

Currently, these files are in /proc/sys/vm:

- admin\_reserve\_kbytes
- block\_dump
- compact\_memory

- compaction\_proactiveness
- compact\_unevictable\_allowed
- dirty\_background\_bytes
- dirty\_background\_ratio
- dirty\_bytes
- dirty\_expire\_centisecs
- dirty\_ratio
- dirtytime\_expire\_seconds
- dirty\_writeback\_centisecs
- drop\_caches
- extfrag\_threshold
- highmem\_is\_dirtyable
- hugetlb\_shm\_group
- laptop\_mode
- legacy\_va\_layout
- lowmem\_reserve\_ratio
- max\_map\_count
- memory\_failure\_early\_kill
- memory\_failure\_recovery
- min\_free\_kbytes
- min\_slab\_ratio
- min\_unmapped\_ratio
- mmap\_min\_addr
- mmap\_rnd\_bits
- mmap\_rnd\_compat\_bits
- nr\_hugepages
- nr\_hugepages\_mempolicy
- nr\_overcommit\_hugepages
- nr\_trim\_pages (only if CONFIG\_MMU=n)
- numa\_zonelist\_order
- oom\_dump\_tasks
- oom\_kill Allocating\_task
- overcommit\_kbytes
- overcommit\_memory

- overcommit\_ratio
- page-cluster
- panic\_on\_oom
- percpu\_pagelist\_fraction
- stat\_interval
- stat\_refresh
- numa\_stat
- swappiness
- unprivileged\_userfaultfd
- user\_reserve\_kbytes
- vfs\_cache\_pressure
- watermark\_boost\_factor
- watermark\_scale\_factor
- zone\_reclaim\_mode

### **admin\_reserve\_kbytes**

The amount of free memory in the system that should be reserved for users with the capability cap\_sys\_admin.

admin\_reserve\_kbytes defaults to min(3% of free pages, 8MB)

That should provide enough for the admin to log in and kill a process, if necessary, under the default overcommit ‘guess’ mode.

Systems running under overcommit ‘never’ should increase this to account for the full Virtual Memory Size of programs used to recover. Otherwise, root may not be able to log in to recover the system.

How do you calculate a minimum useful reserve?

sshd or login + bash (or some other shell) + top (or ps, kill, etc.)

For overcommit ‘guess’ , we can sum resident set sizes (RSS). On x86\_64 this is about 8MB.

For overcommit ‘never’ , we can take the max of their virtual sizes (VSZ) and add the sum of their RSS. On x86\_64 this is about 128MB.

Changing this takes effect whenever an application requests memory.

## block\_dump

block\_dump enables block I/O debugging when set to a nonzero value. More information on block I/O debugging is in [How to conserve battery power using laptop-mode](#).

## compact\_memory

Available only when CONFIG\_COMPACTION is set. When 1 is written to the file, all zones are compacted such that free memory is available in contiguous blocks where possible. This can be important for example in the allocation of huge pages although processes will also directly compact memory as required.

## compaction\_proactiveness

This tunable takes a value in the range [0, 100] with a default value of 20. This tunable determines how aggressively compaction is done in the background. Setting it to 0 disables proactive compaction.

Note that compaction has a non-trivial system-wide impact as pages belonging to different processes are moved around, which could also lead to latency spikes in unsuspecting applications. The kernel employs various heuristics to avoid wasting CPU cycles if it detects that proactive compaction is not being effective.

Be careful when setting it to extreme values like 100, as that may cause excessive background compaction activity.

## compact\_unevictable\_allowed

Available only when CONFIG\_COMPACTION is set. When set to 1, compaction is allowed to examine the unevictable lru (mlocked pages) for pages to compact. This should be used on systems where stalls for minor page faults are an acceptable trade for large contiguous free memory. Set to 0 to prevent compaction from moving pages that are unevictable. Default value is 1. On CONFIG\_PREEMPT\_RT the default value is 0 in order to avoid a page fault, due to compaction, which would block the task from becoming active until the fault is resolved.

## dirty\_background\_bytes

Contains the amount of dirty memory at which the background kernel flusher threads will start writeback.

### Note:

dirty\_background\_bytes is the counterpart of dirty\_background\_ratio. Only one of them may be specified at a time. When one sysctl is written it is immediately taken into account to evaluate the dirty memory limits and the other appears as 0 when read.

### **dirty\_background\_ratio**

Contains, as a percentage of total available memory that contains free pages and reclaimable pages, the number of pages at which the background kernel flusher threads will start writing out dirty data.

The total available memory is not equal to total system memory.

### **dirty\_bytes**

Contains the amount of dirty memory at which a process generating disk writes will itself start writeback.

Note: dirty\_bytes is the counterpart of dirty\_ratio. Only one of them may be specified at a time. When one sysctl is written it is immediately taken into account to evaluate the dirty memory limits and the other appears as 0 when read.

Note: the minimum value allowed for dirty\_bytes is two pages (in bytes); any value lower than this limit will be ignored and the old configuration will be retained.

### **dirty\_expire\_centisecs**

This tunable is used to define when dirty data is old enough to be eligible for writeout by the kernel flusher threads. It is expressed in 100' ths of a second. Data which has been dirty in-memory for longer than this interval will be written out next time a flusher thread wakes up.

### **dirty\_ratio**

Contains, as a percentage of total available memory that contains free pages and reclaimable pages, the number of pages at which a process which is generating disk writes will itself start writing out dirty data.

The total available memory is not equal to total system memory.

### **dirtytime\_expire\_seconds**

When a lazytime inode is constantly having its pages dirtied, the inode with an updated timestamp will never get chance to be written out. And, if the only thing that has happened on the file system is a dirtytime inode caused by an atime update, a worker will be scheduled to make sure that inode eventually gets pushed out to disk. This tunable is used to define when dirty inode is old enough to be eligible for writeback by the kernel flusher threads. And, it is also used as the interval to wakeup dirtytime\_writeback thread.

### **`dirty_writeback_centisecs`**

The kernel flusher threads will periodically wake up and write *old* data out to disk. This tunable expresses the interval between those wakeups, in 100'ths of a second. Setting this to zero disables periodic writeback altogether.

### **`drop_caches`**

Writing to this will cause the kernel to drop clean caches, as well as reclaimable slab objects like dentries and inodes. Once dropped, their memory becomes free.

To free pagecache:

```
echo 1 > /proc/sys/vm/drop_caches
```

To free reclaimable slab objects (includes dentries and inodes):

```
echo 2 > /proc/sys/vm/drop_caches
```

To free slab objects and pagecache:

```
echo 3 > /proc/sys/vm/drop_caches
```

This is a non-destructive operation and will not free any dirty objects. To increase the number of objects freed by this operation, the user may run `sync` prior to writing to `/proc/sys/vm/drop_caches`. This will minimize the number of dirty objects on the system and create more candidates to be dropped.

This file is not a means to control the growth of the various kernel caches (inodes, dentries, pagecache, etc...) These objects are automatically reclaimed by the kernel when memory is needed elsewhere on the system.

Use of this file can cause performance problems. Since it discards cached objects, it may cost a significant amount of I/O and CPU to recreate the dropped objects, especially if they were under heavy use. Because of this, use outside of a testing or debugging environment is not recommended.

You may see informational messages in your kernel log when this file is used:

```
cat (1234): drop_caches: 3
```

These are informational only. They do not mean that anything is wrong with your system. To disable them, echo 4 (bit 2) into `drop_caches`.

### **extfrag\_threshold**

This parameter affects whether the kernel will compact memory or direct reclaim to satisfy a high-order allocation. The extfrag/extfrag\_index file in debugfs shows what the fragmentation index for each order is in each zone in the system. Values tending towards 0 imply allocations would fail due to lack of memory, values towards 1000 imply failures are due to fragmentation and -1 implies that the allocation will succeed as long as watermarks are met.

The kernel will not compact memory in a zone if the fragmentation index is  $\leq$  extfrag\_threshold. The default value is 500.

### **highmem\_is\_dirtyable**

Available only for systems with CONFIG\_HIGHMEM enabled (32b systems).

This parameter controls whether the high memory is considered for dirty writers throttling. This is not the case by default which means that only the amount of memory directly visible/usable by the kernel can be dirtied. As a result, on systems with a large amount of memory and lowmem basically depleted writers might be throttled too early and streaming writes can get very slow.

Changing the value to non zero would allow more memory to be dirtied and thus allow writers to write more data which can be flushed to the storage more effectively. Note this also comes with a risk of pre-mature OOM killer because some writers (e.g. direct block device writes) can only use the low memory and they can fill it up with dirty data without any throttling.

### **hugetlb\_shm\_group**

hugetlb\_shm\_group contains group id that is allowed to create SysV shared memory segment using hugetlb page.

### **laptop\_mode**

laptop\_mode is a knob that controls “laptop mode” . All the things that are controlled by this knob are discussed in [\*How to conserve battery power using laptop-mode\*](#).

### **legacy\_va\_layout**

If non-zero, this sysctl disables the new 32-bit mmap layout - the kernel will use the legacy (2.4) layout for all processes.

## **lowmem\_reserve\_ratio**

For some specialised workloads on highmem machines it is dangerous for the kernel to allow process memory to be allocated from the “lowmem” zone. This is because that memory could then be pinned via the `mlock()` system call, or by unavailability of swapspace.

And on large highmem machines this lack of reclaimable lowmem memory can be fatal.

So the Linux page allocator has a mechanism which prevents allocations which *could* use highmem from using too much lowmem. This means that a certain amount of lowmem is defended from the possibility of being captured into pinned user memory.

(The same argument applies to the old 16 megabyte ISA DMA region. This mechanism will also defend that region from allocations which could use highmem or lowmem).

The `lowmem_reserve_ratio` tunable determines how aggressive the kernel is in defending these lower zones.

If you have a machine which uses highmem or ISA DMA and your applications are using mlock(), or if you are running with no swap then you probably should change the lowmem reserve ratio setting.

The `lowmem_reserve_ratio` is an array. You can see them by reading this file:

```
% cat /proc/sys/vm/lowmem_reserve_ratio  
256 256 32
```

But, these values are not used directly. The kernel calculates # of protection pages for each zones from them. These are shown as array of protection pages in /proc/zoneinfo like followings. (This is an example of x86-64 box). Each zone has an array of protection pages like this:

These protections are added to score to judge whether this zone should be used for page allocation or should be reclaimed.

In this example, if normal pages (index=2) are required to this DMA zone and watermark[WMARK HIGH] is used for watermark, the kernel judges this zone should

not be used because pages\_free(1355) is smaller than watermark + protection[2] ( $4 + 2004 = 2008$ ). If this protection value is 0, this zone would be used for normal page requirement. If requirement is DMA zone(index=0), protection[0] (=0) is used.

zone[i]'s protection[j] is calculated by following expression:

```
(i < j):
    zone[i]->protection[j]
    = (total sums of managed_pages from zone[i+1] to zone[j] on the
      ↵node)
      / lowmem_reserve_ratio[i];
(i = j):
    (should not be protected. = 0;
(i > j):
    (not necessary, but looks 0)
```

The default values of lowmem\_reserve\_ratio[i] are

256	(if zone[i] means DMA or DMA32 zone)
32	(others)

As above expression, they are reciprocal number of ratio. 256 means 1/256. # of protection pages becomes about “0.39%” of total managed pages of higher zones on the node.

If you would like to protect more pages, smaller values are effective. The minimum value is 1 (1/1 -> 100%). The value less than 1 completely disables protection of the pages.

### **max\_map\_count:**

This file contains the maximum number of memory map areas a process may have. Memory map areas are used as a side-effect of calling malloc, directly by mmap, mprotect, and madvise, and also when loading shared libraries.

While most applications need less than a thousand maps, certain programs, particularly malloc debuggers, may consume lots of them, e.g., up to one or two maps per allocation.

The default value is 65536.

### **memory\_failure\_early\_kill:**

Control how to kill processes when uncorrected memory error (typically a 2bit error in a memory module) is detected in the background by hardware that cannot be handled by the kernel. In some cases (like the page still having a valid copy on disk) the kernel will handle the failure transparently without affecting any applications. But if there is no other uptodate copy of the data it will kill to prevent any data corruptions from propagating.

1: Kill all processes that have the corrupted and not reloadable page mapped as soon as the corruption is detected. Note this is not supported for a few types of pages, like kernel internally allocated data or the swap cache, but works for the majority of user pages.

0: Only unmap the corrupted page from all processes and only kill a process who tries to access it.

The kill is done using a catchable SIGBUS with BUS\_MCEERR\_AO, so processes can handle this if they want to.

This is only active on architectures/platforms with advanced machine check handling and depends on the hardware capabilities.

Applications can override this setting individually with the PR\_MCE\_KILL prctl

### **memory\_failure\_recovery**

Enable memory failure recovery (when supported by the platform)

1: Attempt recovery.

0: Always panic on a memory failure.

### **min\_free\_kbytes**

This is used to force the Linux VM to keep a minimum number of kilobytes free. The VM uses this number to compute a watermark[WMARK\_MIN] value for each lowmem zone in the system. Each lowmem zone gets a number of reserved free pages based proportionally on its size.

Some minimal amount of memory is needed to satisfy PF\_MEMALLOC allocations; if you set this to lower than 1024KB, your system will become subtly broken, and prone to deadlock under high loads.

Setting this too high will OOM your machine instantly.

### **min\_slab\_ratio**

This is available only on NUMA kernels.

A percentage of the total pages in each zone. On Zone reclaim (fallback from the local zone occurs) slabs will be reclaimed if more than this percentage of pages in a zone are reclaimable slab pages. This insures that the slab growth stays under control even in NUMA systems that rarely perform global reclaim.

The default is 5 percent.

Note that slab reclaim is triggered in a per zone / node fashion. The process of reclaiming slab memory is currently not node specific and may not be fast.

### **min\_unmapped\_ratio**

This is available only on NUMA kernels.

This is a percentage of the total pages in each zone. Zone reclaim will only occur if more than this percentage of pages are in a state that zone\_reclaim\_mode allows to be reclaimed.

If zone\_reclaim\_mode has the value 4 OR' d, then the percentage is compared against all file-backed unmapped pages including swapcache pages and tmpfs files. Otherwise, only unmapped pages backed by normal files but not tmpfs files and similar are considered.

The default is 1 percent.

### **mmap\_min\_addr**

This file indicates the amount of address space which a user process will be restricted from mmapping. Since kernel null dereference bugs could accidentally operate based on the information in the first couple of pages of memory userspace processes should not be allowed to write to them. By default this value is set to 0 and no protections will be enforced by the security module. Setting this value to something like 64k will allow the vast majority of applications to work correctly and provide defense in depth against future potential kernel bugs.

### **mmap\_rnd\_bits**

This value can be used to select the number of bits to use to determine the random offset to the base address of vma regions resulting from mmap allocations on architectures which support tuning address space randomization. This value will be bounded by the architecture's minimum and maximum supported values.

This value can be changed after boot using the /proc/sys/vm/mmap\_rnd\_bits tunable

### **mmap\_rnd\_compat\_bits**

This value can be used to select the number of bits to use to determine the random offset to the base address of vma regions resulting from mmap allocations for applications run in compatibility mode on architectures which support tuning address space randomization. This value will be bounded by the architecture's minimum and maximum supported values.

This value can be changed after boot using the /proc/sys/vm/mmap\_rnd\_compat\_bits tunable

**nr\_hugepages**

Change the minimum size of the hugepage pool.

See *HugeTLB Pages*

**nr\_hugepages\_mempolicy**

Change the size of the hugepage pool at run-time on a specific set of NUMA nodes.

See *HugeTLB Pages*

**nr\_overcommit\_hugepages**

Change the maximum size of the hugepage pool. The maximum is nr\_hugepages + nr\_overcommit\_hugepages.

See *HugeTLB Pages*

**nr\_trim\_pages**

This is available only on NOMMU kernels.

This value adjusts the excess page trimming behaviour of power-of-2 aligned NOMMU mmap allocations.

A value of 0 disables trimming of allocations entirely, while a value of 1 trims excess pages aggressively. Any value >= 1 acts as the watermark where trimming of allocations is initiated.

The default value is 1.

See *No-MMU memory mapping support* for more information.

**numa\_zonelist\_order**

This sysctl is only for NUMA and it is deprecated. Anything but Node order will fail!

‘where the memory is allocated from’ is controlled by zonelists.

(This documentation ignores ZONE\_HIGHMEM/ZONE\_DMA32 for simple explanation. you may be able to read ZONE\_DMA as ZONE\_DMA32…)

In non-NUMA case, a zonelist for GFP\_KERNEL is ordered as following.  
ZONE\_NORMAL -> ZONE\_DMA This means that a memory allocation request for GFP\_KERNEL will get memory from ZONE\_DMA only when ZONE\_NORMAL is not available.

In NUMA case, you can think of following 2 types of order. Assume 2 node NUMA and below is zonelist of Node(0)’ s GFP\_KERNEL:

- (A) Node(0) ZONE\_NORMAL -> Node(0) ZONE\_DMA -> Node(1) ZONE\_NORMAL
- (B) Node(0) ZONE\_NORMAL -> Node(1) ZONE\_NORMAL -> Node(0) ZONE\_DMA.

Type(A) offers the best locality for processes on Node(0), but ZONE\_DMA will be used before ZONE\_NORMAL exhaustion. This increases possibility of out-of-memory(OOM) of ZONE\_DMA because ZONE\_DMA is tend to be small.

Type(B) cannot offer the best locality but is more robust against OOM of the DMA zone.

Type(A) is called as “Node” order. Type (B) is “Zone” order.

“Node order” orders the zonelists by node, then by zone within each node. Specify “[Nn]ode” for node order

“Zone Order” orders the zonelists by zone type, then by node within each zone. Specify “[Zz]one” for zone order.

Specify “[Dd]efault” to request automatic configuration.

On 32-bit, the Normal zone needs to be preserved for allocations accessible by the kernel, so “zone” order will be selected.

On 64-bit, devices that require DMA32/DMA are relatively rare, so “node” order will be selected.

Default order is recommended unless this is causing problems for your system/application.

### **oom\_dump\_tasks**

Enables a system-wide task dump (excluding kernel threads) to be produced when the kernel performs an OOM-killing and includes such information as pid, uid, tgid, vm size, rss, pgtables\_bytes, swapents, oom\_score\_adj score, and name. This is helpful to determine why the OOM killer was invoked, to identify the rogue task that caused it, and to determine why the OOM killer chose the task it did to kill.

If this is set to zero, this information is suppressed. On very large systems with thousands of tasks it may not be feasible to dump the memory state information for each one. Such systems should not be forced to incur a performance penalty in OOM conditions when the information may not be desired.

If this is set to non-zero, this information is shown whenever the OOM killer actually kills a memory-hogging task.

The default value is 1 (enabled).

### **oom\_kill Allocating\_task**

This enables or disables killing the OOM-triggering task in out-of-memory situations.

If this is set to zero, the OOM killer will scan through the entire tasklist and select a task based on heuristics to kill. This normally selects a rogue memory-hogging task that frees up a large amount of memory when killed.

If this is set to non-zero, the OOM killer simply kills the task that triggered the out-of-memory condition. This avoids the expensive tasklist scan.

If `panic_on_oom` is selected, it takes precedence over whatever value is used in `oom_kill Allocating_Task`.

The default value is 0.

### **overcommit\_kbytes**

When `overcommit_memory` is set to 2, the committed address space is not permitted to exceed swap plus this amount of physical RAM. See below.

Note: `overcommit_kbytes` is the counterpart of `overcommit_ratio`. Only one of them may be specified at a time. Setting one disables the other (which then appears as 0 when read).

### **overcommit\_memory**

This value contains a flag that enables memory overcommitment.

When this flag is 0, the kernel attempts to estimate the amount of free memory left when userspace requests more memory.

When this flag is 1, the kernel pretends there is always enough memory until it actually runs out.

When this flag is 2, the kernel uses a “never overcommit” policy that attempts to prevent any overcommit of memory. Note that `user_reserve_kbytes` affects this policy.

This feature can be very useful because there are a lot of programs that `malloc()` huge amounts of memory “just-in-case” and don’t use much of it.

The default value is 0.

See [Documentation/vm/overcommit-accounting.rst](#) and [mm/util.c::\\_\\_vm\\_enough\\_memory\(\)](#) for more information.

### **overcommit\_ratio**

When `overcommit_memory` is set to 2, the committed address space is not permitted to exceed swap plus this percentage of physical RAM. See above.

### **page-cluster**

`page-cluster` controls the number of pages up to which consecutive pages are read in from swap in a single attempt. This is the swap counterpart to page cache readahead. The mentioned consecutivity is not in terms of virtual/physical addresses, but consecutive on swap space - that means they were swapped out together.

It is a logarithmic value - setting it to zero means “1 page”, setting it to 1 means “2 pages”, setting it to 2 means “4 pages”, etc. Zero disables swap readahead completely.

The default value is three (eight pages at a time). There may be some small benefits in tuning this to a different value if your workload is swap-intensive.

Lower values mean lower latencies for initial faults, but at the same time extra faults and I/O delays for following faults if they would have been part of that consecutive pages readahead would have brought in.

### **panic\_on\_oom**

This enables or disables panic on out-of-memory feature.

If this is set to 0, the kernel will kill some rogue process, called oom\_killer. Usually, oom\_killer can kill rogue processes and system will survive.

If this is set to 1, the kernel panics when out-of-memory happens. However, if a process limits using nodes by mempolicy/cpusets, and those nodes become memory exhaustion status, one process may be killed by oom-killer. No panic occurs in this case. Because other nodes' memory may be free. This means system total status may be not fatal yet.

If this is set to 2, the kernel panics compulsorily even on the above-mentioned. Even oom happens under memory cgroup, the whole system panics.

The default value is 0.

1 and 2 are for failover of clustering. Please select either according to your policy of failover.

`panic_on_oom=2+kdump` gives you very strong tool to investigate why oom happens. You can get snapshot.

### **percpu\_pagelist\_fraction**

This is the fraction of pages at most (high mark pcp->high) in each zone that are allocated for each per cpu page list. The min value for this is 8. It means that we don't allow more than 1/8th of pages in each zone to be allocated in any single per\_cpu\_pagelist. This entry only changes the value of hot per cpu pagelists. User can specify a number like 100 to allocate 1/100th of each zone to each per cpu page list.

The batch value of each per cpu pagelist is also updated as a result. It is set to `pcp->high/4`. The upper limit of batch is (`PAGE_SHIFT * 8`)

The initial value is zero. Kernel does not use this value at boot time to set the high water marks for each per cpu page list. If the user writes '0' to this sysctl, it will revert to this default behavior.

### **stat\_interval**

The time interval between which vm statistics are updated. The default is 1 second.

## stat\_refresh

Any read or write (by root only) flushes all the per-cpu vm statistics into their global totals, for more accurate reports when testing e.g. `cat /proc/sys/vm/stat_refresh` `/proc/meminfo`

As a side-effect, it also checks for negative totals (elsewhere reported as 0) and “fails” with EINVAL if any are found, with a warning in dmesg. (At time of writing, a few stats are known sometimes to be found negative, with no ill effects: errors and warnings on these stats are suppressed.)

## numa\_stat

This interface allows runtime configuration of numa statistics.

When page allocation performance becomes a bottleneck and you can tolerate some possible tool breakage and decreased numa counter precision, you can do:

```
echo 0 > /proc/sys/vm/numa_stat
```

When page allocation performance is not a bottleneck and you want all tooling to work, you can do:

```
echo 1 > /proc/sys/vm/numa_stat
```

## swappiness

This control is used to define the rough relative IO cost of swapping and filesystem paging, as a value between 0 and 200. At 100, the VM assumes equal IO cost and will thus apply memory pressure to the page cache and swap-backed pages equally; lower values signify more expensive swap IO, higher values indicates cheaper.

Keep in mind that filesystem IO patterns under memory pressure tend to be more efficient than swap’s random IO. An optimal value will require experimentation and will also be workload-dependent.

The default value is 60.

For in-memory swap, like zram or zswap, as well as hybrid setups that have swap on faster devices than the filesystem, values beyond 100 can be considered. For example, if the random IO against the swap device is on average 2x faster than IO from the filesystem, swappiness should be 133 ( $x + 2x = 200$ ,  $2x = 133.33$ ).

At 0, the kernel will not initiate swap until the amount of free and file-backed pages is less than the high watermark in a zone.

### **unprivileged\_userfaultfd**

This flag controls whether unprivileged users can use the userfaultfd system calls. Set this to 1 to allow unprivileged users to use the userfaultfd system calls, or set this to 0 to restrict userfaultfd to only privileged users (with `SYS_CAP_PTRACE` capability).

The default value is 1.

### **user\_reserve\_kbytes**

When `overcommit_memory` is set to 2, “never overcommit” mode, reserve `min(3% of current process size, user_reserve_kbytes)` of free memory. This is intended to prevent a user from starting a single memory hogging process, such that they cannot recover (kill the hog).

`user_reserve_kbytes` defaults to `min(3% of the current process size, 128MB)`.

If this is reduced to zero, then the user will be allowed to allocate all free memory with a single process, minus `admin_reserve_kbytes`. Any subsequent attempts to execute a command will result in “`fork: Cannot allocate memory`” .

Changing this takes effect whenever an application requests memory.

### **vfs\_cache\_pressure**

This percentage value controls the tendency of the kernel to reclaim the memory which is used for caching of directory and inode objects.

At the default value of `vfs_cache_pressure=100` the kernel will attempt to reclaim dentries and inodes at a “fair” rate with respect to pagecache and swapcache reclaim. Decreasing `vfs_cache_pressure` causes the kernel to prefer to retain dentry and inode caches. When `vfs_cache_pressure=0`, the kernel will never reclaim dentries and inodes due to memory pressure and this can easily lead to out-of-memory conditions. Increasing `vfs_cache_pressure` beyond 100 causes the kernel to prefer to reclaim dentries and inodes.

Increasing `vfs_cache_pressure` significantly beyond 100 may have negative performance impact. Reclaim code needs to take various locks to find freeable directory and inode objects. With `vfs_cache_pressure=1000`, it will look for ten times more freeable objects than there are.

### **watermark\_boost\_factor**

This factor controls the level of reclaim when memory is being fragmented. It defines the percentage of the high watermark of a zone that will be reclaimed if pages of different mobility are being mixed within pageblocks. The intent is that compaction has less work to do in the future and to increase the success rate of future high-order allocations such as SLUB allocations, THP and hugetlbfs pages.

To make it sensible with respect to the `watermark_scale_factor` parameter, the unit is in fractions of 10,000. The default value of 15,000 on !DISCONTIGMEM configurations means that up to 150% of the high watermark will be reclaimed in

the event of a pageblock being mixed due to fragmentation. The level of reclaim is determined by the number of fragmentation events that occurred in the recent past. If this value is smaller than a pageblock then a pageblocks worth of pages will be reclaimed (e.g. 2MB on 64-bit x86). A boost factor of 0 will disable the feature.

### **`watermark_scale_factor`**

This factor controls the aggressiveness of kswapd. It defines the amount of memory left in a node/system before kswapd is woken up and how much memory needs to be free before kswapd goes back to sleep.

The unit is in fractions of 10,000. The default value of 10 means the distances between watermarks are 0.1% of the available memory in the node/system. The maximum value is 3000, or 30% of memory.

A high rate of threads entering direct reclaim (allocstall) or kswapd going to sleep prematurely (kswapd\_low\_wmark\_hit\_quickly) can indicate that the number of free pages kswapd maintains for latency reasons is too small for the allocation bursts occurring in the system. This knob can then be used to tune kswapd aggressiveness accordingly.

### **`zone_reclaim_mode`**

`Zone_reclaim_mode` allows someone to set more or less aggressive approaches to reclaim memory when a zone runs out of memory. If it is set to zero then no zone reclaim occurs. Allocations will be satisfied from other zones / nodes in the system.

This is value OR'ed together of

- |   |                                     |
|---|-------------------------------------|
| 1 | Zone reclaim on                     |
| 2 | Zone reclaim writes dirty pages out |
| 4 | Zone reclaim swaps                  |

`zone_reclaim_mode` is disabled by default. For file servers or workloads that benefit from having their data cached, `zone_reclaim_mode` should be left disabled as the caching effect is likely to be more important than data locality.

Consider enabling one or more `zone_reclaim` mode bits if it's known that the workload is partitioned such that each partition fits within a NUMA node and that accessing remote memory would cause a measurable performance reduction. The page allocator will take additional actions before allocating off node pages.

Allowing zone reclaim to write out pages stops processes that are writing large amounts of data from dirtying pages on other nodes. Zone reclaim will write out dirty pages if a zone fills up and so effectively throttle the process. This may decrease the performance of a single process since it cannot use all of system memory to buffer the outgoing writes anymore but it preserve the memory on other nodes so that the performance of other processes running on other nodes will not be affected.

Allowing regular swap effectively restricts allocations to the local node unless explicitly overridden by memory policies or cpuset configurations.

## LINUX ABI DESCRIPTION

### 5.1 ABI stable symbols

Documents the interfaces that the developer has defined to be stable.

Userspace programs are free to use these interfaces with no restrictions, and backward compatibility for them will be guaranteed for at least 2 years.

Most interfaces (like syscalls) are expected to never change and always be available.

#### 5.1.1 Symbols under /dev/fw

/dev/fw[0-9]+

Defined on file *firewire-cdev*

The character device files /dev/fw\* are the interface between firewire-core and IEEE 1394 device drivers implemented in userspace. The ioctl(2)- and read(2)-based ABI is defined and documented in <linux/firewire-cdev.h>.

This ABI offers most of the features which firewire-core also exposes to kernelspace IEEE 1394 drivers.

Each /dev/fw\* is associated with one IEEE 1394 node, which can be remote or local nodes. Operations on a /dev/fw\* file have different scope:

- The 1394 node which is associated with the file:
  - Asynchronous request transmission
  - Get the Configuration ROM
  - Query node ID
  - Query maximum speed of the path between this node and local node
- The 1394 bus (i.e. “card” ) to which the node is attached to:
  - Isochronous stream transmission and reception
  - Asynchronous stream transmission and reception
  - Asynchronous broadcast request transmission

- PHY packet transmission and reception
  - Allocate, reallocate, deallocate isochronous resources (channels, bandwidth) at the bus' s IRM
  - Query node IDs of local node, root node, IRM, bus manager
  - Query cycle time
  - Bus reset initiation, bus reset event reception
- All 1394 buses:
    - Allocation of IEEE 1212 address ranges on the local link layers, reception of inbound requests to such an address range, asynchronous response transmission to inbound requests
    - Addition of descriptors or directories to the local nodes' Configuration ROM

Due to the different scope of operations and in order to let userland implement different access permission models, some operations are restricted to `/dev/fw*` files that are associated with a local node:

- Addition of descriptors or directories to the local nodes' Configuration ROM
- PHY packet transmission and reception

A `/dev/fw*` file remains associated with one particular node during its entire life time. Bus topology changes, and hence node ID changes, are tracked by firewire-core. ABI users do not need to be aware of topology.

The following file operations are supported:

### **open(2)**

Currently the only useful flags are `O_RDWR`.

### **ioctl(2)**

Initiate various actions. Some take immediate effect, others are performed asynchronously while or after the ioctl returns. See the inline documentation in `<linux/firewire-cdev.h>` for descriptions of all ioctls.

### **poll(2), select(2), epoll\_wait(2) etc.**

Watch for events to become available to be read.

### **read(2)**

Receive various events. There are solicited events like outbound asynchronous transaction completion or isochronous buffer completion, and unsolicited events such as bus resets, request reception, or PHY packet reception. Always use a read buffer which is large enough to receive the largest event that could ever arrive. See `<linux/firewire-cdev.h>` for descriptions of all event types and for which ioctls affect reception of events.

### **mmap(2)**

Allocate a DMA buffer for isochronous reception or transmission and map it into the process address space. The arguments should be used as follows: `addr = NULL`, `length =` the desired buffer size, i.e. number of packets times size of largest packet, `prot =` at least `PROT_READ` for reception and at least `PROT_WRITE` for transmission, `flags = MAP_SHARED`, `fd =` the handle to the `/dev/fw*`, `offset = 0`.

Isochronous reception works in packet-per-buffer fashion except for multichannel reception which works in buffer-fill mode.

### **munmap(2)**

Unmap the isochronous I/O buffer from the process address space.

### **close(2)**

Besides stopping and freeing I/O contexts that were associated with the file descriptor, back out any changes to the local nodes' Configuration ROM. Deallocate isochronous channels and bandwidth at the IRM that were marked for kernel-assisted re- and deallocation.

Users: libraw1394; libdc1394; libhinawa; tools like linux-firewire-utils, fwhack, ...

## **5.1.2 Symbols under /sys/Accessibility**

### **/sys/Accessibility/speakup/<synth-name>/**

Defined on file *sysfs-driver-speakup*

In */sys/Accessibility/speakup* is a directory corresponding to the synthesizer driver currently in use (E.G) *soft* for the soft driver. This directory contains files which control the speech synthesizer itself, as opposed to controlling the speakup screen reader. The parameters in this directory have the same names and functions across all supported synthesizers. The range of values for freq, pitch, rate, and vol is the same for all supported synthesizers, with the given range being internally mapped by the driver to more or less fit the range of values supported for a given parameter by the individual synthesizer. Below is a description of values and parameters for soft synthesizer, which is currently the most commonly used.

### **/sys/Accessibility/speakup/attrib\_bleep**

Defined on file *sysfs-driver-speakup*

Beeps the PC speaker when there is an attribute change such as foreground or background color when using speakup review commands. One = on, zero = off.

### **/sys/Accessibility/speakup/bell\_pos**

Defined on file *sysfs-driver-speakup*

This works much like a typewriter bell. If for example 72 is echoed to bell\_pos, it will beep the PC speaker when typing on a line past character 72.

### **/sys/Accessibility/speakup/bleep\_time**

Defined on file *sysfs-driver-speakup*

This controls the duration of the PC speaker beeps speakup produces. TODO: What are the units? Jiffies?

### **/sys/accessibility/speakup/bleeps**

Defined on file *sysfs-driver-speakup*

This controls whether one hears beeps through the PC speaker when using speakup's review commands. TODO: what values does it accept?

### **/sys/accessibility/speakup/cursor\_time**

Defined on file *sysfs-driver-speakup*

This controls cursor delay when using arrow keys. When a connection is very slow, with the default setting, when moving with the arrows, or backspacing etc. speakup says the incorrect characters. Set this to a higher value to adjust for the delay and better synchronisation between cursor position and speech.

### **/sys/accessibility/speakup/delimiters**

Defined on file *sysfs-driver-speakup*

Delimit a word from speakup. TODO: add more info

### **/sys/accessibility/speakup/ex\_num**

Defined on file *sysfs-driver-speakup*

TODO:

### **/sys/accessibility/speakup/i18n/announcements**

Defined on file *sysfs-driver-speakup*

This file contains various general announcements, most of which cannot be categorized. You will find messages such as "You killed Speakup", "I'm alive", "leaving help", "parked", "unparked", and others. You will also find the names of the screen edges and cursor tracking modes here.

### **/sys/accessibility/speakup/i18n/characters**

Defined on file *sysfs-driver-speakup*

Through this sys entry, Speakup gives you the ability to change how Speakup pronounces a given character. You could, for example, change how some punctuation characters are spoken. You can even change how Speakup will pronounce certain letters. For further details see '12. Changing the Pronunciation of Characters' in Speakup User's Guide (file spkguide.txt in source).

### **/sys/accessibility/speakup/i18n/chartab**

Defined on file *sysfs-driver-speakup*

TODO

---

**/sys/accessibility/speakup/i18n/colors**

---

Defined on file *sysfs-driver-speakup*

When you use the “say attributes” function, Speakup says the name of the foreground and background colors. These names come from the i18n/colors file.

---

**/sys/accessibility/speakup/i18n/ctl\_keys**

---

Defined on file *sysfs-driver-speakup*

Here, you will find names of control keys. These are used with Speakup’s say\_control feature.

---

**/sys/accessibility/speakup/i18n/formatted**

---

Defined on file *sysfs-driver-speakup*

This group of messages contains embedded formatting codes, to specify the type and width of displayed data. If you change these, you must preserve all of the formatting codes, and they must appear in the order used by the default messages.

---

**/sys/accessibility/speakup/i18n/function\_names**

---

Defined on file *sysfs-driver-speakup*

Here, you will find a list of names for Speakup functions. These are used by the help system. For example, suppose that you have activated help mode, and you pressed keypad 3. Speakup says: “keypad 3 is character, say next.” The message “character, say next” names a Speakup function, and it comes from this function\_names file.

---

**/sys/accessibility/speakup/i18n/key\_names**

---

Defined on file *sysfs-driver-speakup*

Again, key\_names is used by Speakup’s help system. In the previous example, Speakup said that you pressed “keypad 3.” This name came from the key\_names file.

---

**/sys/accessibility/speakup/i18n/states**

---

Defined on file *sysfs-driver-speakup*

This file contains names for key states. Again, these are part of the help system. For instance, if you had pressed speakup + keypad 3, you would hear: “speakup keypad 3 is go to bottom edge.”

The speakup key is depressed, so the name of the key state is speakup.

This part of the message comes from the states collection.

### **/sys/accessibility/speakup/key\_echo**

Defined on file [sysfs-driver-speakup](#)

Controls if speakup speaks keys when they are typed. One = on, zero = off or don't echo keys.

### **/sys/accessibility/speakup/keymap**

Defined on file [sysfs-driver-speakup](#)

Speakup keymap remaps keys to Speakup functions. It uses a binary format. A special program called genmap is needed to compile a textual keymap into the binary format which is then loaded into [/sys/accessibility/speakup/keymap](#).

### **/sys/accessibility/speakup/no\_interrupt**

Defined on file [sysfs-driver-speakup](#)

Controls if typing interrupts output from speakup. With no\_interrupt set to zero, typing on the keyboard will interrupt speakup if for example the say screen command is used before the entire screen is read.

With no\_interrupt set to one, if the say screen command is used, and one then types on the keyboard, speakup will continue to say the whole screen regardless until it finishes.

### **/sys/accessibility/speakup/punc\_all**

Defined on file [sysfs-driver-speakup](#)

This is a list of all the punctuation speakup should speak when punc\_level is set to four.

### **/sys/accessibility/speakup/punc\_level**

Defined on file [sysfs-driver-speakup](#)

Controls the level of punctuation spoken as the screen is displayed, not reviewed. Levels range from zero no punctuation, to four, all punctuation. One corresponds to punc\_some, two corresponds to punc\_most, and three as well as four both correspond to punc\_all. Some hardware synthesizers may have different levels each

corresponding to three and four for punc\_level. Also note that if punc\_level is set to zero, and key\_echo is set to one, typed punctuation is still spoken as it is typed.

---

**/sys/Accessibility/speakup/punc\_most**

Defined on file *sysfs-driver-speakup*

This is a list of all the punctuation speakup should speak when punc\_level is set to two.

---

**/sys/Accessibility/speakup/punc\_some**

Defined on file *sysfs-driver-speakup*

This is a list of all the punctuation speakup should speak when punc\_level is set to one.

---

**/sys/Accessibility/speakup/reading\_punc**

Defined on file *sysfs-driver-speakup*

Almost the same as punc\_level, the differences being that reading\_punc controls the level of punctuation when reviewing the screen with speakup's screen review commands. The other difference is that reading\_punc set to three speaks punc\_all, and reading\_punc set to four speaks all punctuation, including spaces.

---

**/sys/Accessibility/speakup/repeats**

Defined on file *sysfs-driver-speakup*

A list of characters speakup repeats. Normally, when there are more than three characters in a row, speakup just reads three of those characters. For example, “.....” would be read as dot, dot, dot. If a . is added to the list of characters in repeats, “.....” would be read as dot, dot, dot, times six.

---

**/sys/Accessibility/speakup/say\_control**

Defined on file *sysfs-driver-speakup*

If set to one, speakup speaks shift, alt and control when those keys are pressed. If say\_control is set to zero, shift, ctrl, and alt are not spoken when they are pressed.

---

**/sys/Accessibility/speakup/say\_word\_ctl**

Defined on file *sysfs-driver-speakup*

TODO:

---

**/sys/Accessibility/speakup/silent**

Defined on file *sysfs-driver-speakup*

TODO:

---

### **/sys/Accessibility/speakup/soft/caps\_start**

---

Defined on file *sysfs-driver-speakup*

This is the string that is sent to the synthesizer to cause it to start speaking uppercase letters. For the soft synthesizer and most others, this causes the pitch of the voice to rise above the currently set pitch.

---

### **/sys/Accessibility/speakup/soft/caps\_stop**

---

Defined on file *sysfs-driver-speakup*

This is the string sent to the synthesizer to cause it to stop speaking uppercase letters. In the case of the soft synthesizer and most others, this returns the pitch of the voice down to the currently set pitch.

---

### **/sys/Accessibility/speakup/soft/delay\_time**

---

Defined on file *sysfs-driver-speakup*

TODO:

---

### **/sys/Accessibility/speakup/soft/direct**

---

Defined on file *sysfs-driver-speakup*

Controls if punctuation is spoken by speakup, or by the synthesizer.

For example, speakup speaks “>” as “greater”, while the espeak synthesizer used by the soft driver speaks “greater than”. Zero lets speakup speak the punctuation. One lets the synthesizer itself speak punctuation.

---

### **/sys/Accessibility/speakup/soft/freq**

---

Defined on file *sysfs-driver-speakup*

Gets or sets the frequency of the speech synthesizer. Range is 0-9.

---

### **/sys/Accessibility/speakup/soft/full\_time**

---

Defined on file *sysfs-driver-speakup*

TODO:

---

### **/sys/Accessibility/speakup/soft/inflection**

---

Defined on file *sysfs-driver-speakup*

Gets or sets the inflection of the synthesizer, i.e. the pitch range. The range is 0-9.

---

### **/sys/accessibility/speakup/soft/jiffy\_delta**

---

Defined on file *sysfs-driver-speakup*

This controls how many jiffies the kernel gives to the synthesizer. Setting this too high can make a system unstable, or even crash it.

---

### **/sys/accessibility/speakup/soft/pitch**

---

Defined on file *sysfs-driver-speakup*

Gets or sets the pitch of the synthesizer. The range is 0-9.

---

### **/sys/accessibility/speakup/soft/punct**

---

Defined on file *sysfs-driver-speakup*

Gets or sets the amount of punctuation spoken by the synthesizer. The range for the soft driver seems to be 0-2. TODO: How is this related to speakup's punc\_level, or reading\_punc.

---

### **/sys/accessibility/speakup/soft/rate**

---

Defined on file *sysfs-driver-speakup*

Gets or sets the rate of the synthesizer. Range is from zero slowest, to nine fastest.

---

### **/sys/accessibility/speakup/soft/tone**

---

Defined on file *sysfs-driver-speakup*

Gets or sets the tone of the speech synthesizer. The range for the soft driver seems to be 0-2. This seems to make no difference if using espeak and the espeakup connector. TODO: does espeakup support different tonalities?

---

### **/sys/accessibility/speakup/soft/trigger\_time**

---

Defined on file *sysfs-driver-speakup*

TODO:

---

### **/sys/accessibility/speakup/soft/voice**

---

Defined on file *sysfs-driver-speakup*

Gets or sets the voice used by the synthesizer if the synthesizer can speak in more than one voice. The range for the soft driver is 0-7. Note that while espeak supports multiple voices, this parameter will not set the voice when the espeakup connector is used between speakup and espeak.

### /sys/Accessibility/speakup/soft/vol

Defined on file *sysfs-driver-speakup*

Gets or sets the volume of the speech synthesizer. Range is 0-9, with zero being the softest, and nine being the loudest.

### /sys/Accessibility/speakup/spell\_delay

Defined on file *sysfs-driver-speakup*

This controls how fast a word is spelled when speakup's say word review command is pressed twice quickly to speak the current word being reviewed. Zero just speaks the letters one after another, while values one through four seem to introduce more of a pause between the spelling of each letter by speakup.

### /sys/Accessibility/speakup/synth

Defined on file *sysfs-driver-speakup*

Gets or sets the synthesizer driver currently in use. Reading synth returns the synthesizer driver currently in use. Writing synth switches to the given synthesizer driver, provided it is either built into the kernel, or already loaded as a module.

### /sys/Accessibility/speakup/synth\_direct

Defined on file *sysfs-driver-speakup*

Sends whatever is written to synth\_direct directly to the speech synthesizer in use, bypassing speakup. This could be used to make the synthesizer speak a string, or to send control sequences to the synthesizer to change how the synthesizer behaves.

### /sys/Accessibility/speakup/version

Defined on file *sysfs-driver-speakup*

Reading version returns the version of speakup, and the version of the synthesizer driver currently in use.

### 5.1.3 Symbols under /sys/bus

**/sys/bus/dsa/devices/dsa<m>/cdev\_major**

Defined on file *sysfs-driver-dma-idxd*

The major number that the character device driver assigned to this device.

**/sys/bus/dsa/devices/dsa<m>/cmd\_status**

Defined on file *sysfs-driver-dma-idxd*

The last executed device administrative command's status/error.

**/sys/bus/dsa/devices/dsa<m>/configurable**

Defined on file *sysfs-driver-dma-idxd*

To indicate if this device is configurable or not.

**/sys/bus/dsa/devices/dsa<m>/engine<m>.n**

Defined on file *sysfs-driver-dma-idxd*

The assigned engine under this device.

**/sys/bus/dsa/devices/dsa<m>/errors**

Defined on file *sysfs-driver-dma-idxd*

The error information for this device.

**/sys/bus/dsa/devices/dsa<m>/group<m>.n**

Defined on file *sysfs-driver-dma-idxd*

The assigned group under this device.

**/sys/bus/dsa/devices/dsa<m>/max\_batch\_size**

Defined on file *sysfs-driver-dma-idxd*

The largest number of work descriptors in a batch.

**/sys/bus/dsa/devices/dsa<m>/max\_engines**

Defined on file *sysfs-driver-dma-idxd*

The maximum number of engines supported by this device.

**/sys/bus/dsa/devices/dsa<m>/max\_groups**

Defined on file *sysfs-driver-dma-idxd*

The maximum number of groups can be created under this device.

**/sys/bus/dsa/devices/dsa<m>/max\_tokens**

Defined on file *sysfs-driver-dma-idxd*

The total number of bandwidth tokens supported by this device. The bandwidth tokens represent resources within the DSA implementation, and these resources are allocated by engines to support operations.

**/sys/bus/dsa/devices/dsa<m>/max\_transfer\_size**

Defined on file *sysfs-driver-dma-idxd*

The number of bytes to be read from the source address to perform the operation. The maximum transfer size is dependent on the workqueue the descriptor was submitted to.

**/sys/bus/dsa/devices/dsa<m>/max\_work\_queues**

Defined on file *sysfs-driver-dma-idxd*

The maximum work queue number that this device supports.

**/sys/bus/dsa/devices/dsa<m>/max\_work\_queues\_size**

Defined on file *sysfs-driver-dma-idxd*

The maximum work queue size supported by this device.

**/sys/bus/dsa/devices/dsa<m>/numa\_node**

Defined on file *sysfs-driver-dma-idxd*

The numa node number for this device.

**/sys/bus/dsa/devices/dsa<m>/op\_cap**

Defined on file *sysfs-driver-dma-idxd*

The operation capability bit mask specify the operation types supported by the this device.

**/sys/bus/dsa/devices/dsa<m>/state**

Defined on file *sysfs-driver-dma-idxd*

The state information of this device. It can be either enabled or disabled.

**/sys/bus/dsa/devices/dsa<m>/token\_limit**

Defined on file *sysfs-driver-dma-idxd*

The maximum number of bandwidth tokens that may be in use at one time by operations that access low bandwidth memory in the device.

**/sys/bus/dsa/devices/dsa<m>/version**

Defined on file *sysfs-driver-dma-idxd*

The hardware version number.

**/sys/bus/dsa/devices/dsa<m>/wq<m>.<n>**

Defined on file *sysfs-driver-dma-idxd*

The assigned work queue under this device.

**/sys/bus/dsa/devices/engine<m>.<n>/group\_id**

Defined on file *sysfs-driver-dma-idxd*

The group that this engine belongs to.

**/sys/bus/dsa/devices/wq<m>.<n>/cdev\_minor**

Defined on file *sysfs-driver-dma-idxd*

The minor number assigned to this work queue by the character device driver.

**/sys/bus/dsa/devices/wq<m>.<n>/group\_id**

Defined on file *sysfs-driver-dma-idxd*

The group id that this work queue belongs to.

**/sys/bus/dsa/devices/wq<m>.<n>/max\_batch\_size**

Defined on file *sysfs-driver-dma-idxd*

The max batch size for this workqueue. Cannot exceed device max batch size. Configurable parameter.

**/sys/bus/dsa/devices/wq<m>.<n>/max\_transfer\_size**

Defined on file *sysfs-driver-dma-idxd*

The max transfer sized for this workqueue. Cannot exceed device max transfer size. Configurable parameter.

**/sys/bus/dsa/devices/wq<m>.<n>/mode**

Defined on file *sysfs-driver-dma-idxd*

The work queue mode type for this work queue.

**/sys/bus/dsa/devices/wq<m>.<n>/priority**

Defined on file *sysfs-driver-dma-idxd*

The priority value of this work queue, it is a value relative to other work queue in the same group to control quality of service for dispatching work from multiple workqueues in the same group.

**/sys/bus/dsa/devices/wq<m>.<n>/size**

Defined on file *sysfs-driver-dma-idxd*

The work queue size for this work queue.

**/sys/bus/dsa/devices/wq<m>.<n>/state**

Defined on file *sysfs-driver-dma-idxd*

The current state of the work queue.

**/sys/bus/dsa/devices/wq<m>.<n>/threshold**

Defined on file *sysfs-driver-dma-idxd*

The number of entries in this work queue that may be filled via a limited portal.

**/sys/bus/dsa/devices/wq<m>.<n>/type**

Defined on file *sysfs-driver-dma-idxd*

The type of this work queue, it can be “kernel” type for work queue usages in the kernel space or “user” type for work queue usages by applications in user space.

---

**/sys/bus/firewire/devices/\*/**

---

Defined on file [sysfs-bus-firewire](#)

Attributes common to IEEE 1394 node devices and unit devices. Read-only. Mutable during the node device's lifetime. Immutable during the unit device's lifetime. See IEEE 1212 for semantic definitions.

These attributes are only created if the root directory of an IEEE 1394 node or the unit directory of an IEEE 1394 unit actually contains according entries.

**hardware\_version**

Hexadecimal string representation of an u24.

**hardware\_version\_name**

Contents of a respective textual descriptor leaf.

**model**

Hexadecimal string representation of an u24.

**model\_name**

Contents of a respective textual descriptor leaf.

**specifier\_id**

Hexadecimal string representation of an u24. Mandatory in unit directories according to IEEE 1212.

**vendor**

Hexadecimal string representation of an u24. Mandatory in the root directory according to IEEE 1212.

**vendor\_name**

Contents of a respective textual descriptor leaf.

**version**

Hexadecimal string representation of an u24. Mandatory in unit directories according to IEEE 1212.

---

**/sys/bus/firewire/devices/fw[0-9]+/**

---

Defined on file [sysfs-bus-firewire](#)

IEEE 1394 node device attributes. Read-only. Mutable during the node device's lifetime. See IEEE 1212 for semantic definitions.

**config\_rom**

Contents of the Configuration ROM register. Binary attribute; an array of host-endian u32.

**guid**

The node's EUI-64 in the bus information block of Configuration ROM. Hexadecimal string representation of an u64.

---

**/sys/bus/firewire/devices/fw[0-9]+/is\_local**

---

Defined on file *sysfs-bus-fibre*

IEEE 1394 node device attribute. Read-only and immutable. Values: 1: The sysfs entry represents a local node (a controller card).

0: The sysfs entry represents a remote node.

**/sys/bus/fibre/devices/fw[0-9]+/units**

Defined on file *sysfs-bus-fibre*

IEEE 1394 node device attribute. Read-only. Mutable during the node device's lifetime. See IEEE 1212 for semantic definitions.

### **units**

Summary of all units present in an IEEE 1394 node. Contains space-separated tuples of specifier\_id and version of each unit present in the node. Specifier\_id and version are hexadecimal string representations of u24 of the respective unit directory entries. Specifier\_id and version within each tuple are separated by a colon.

Users: udev rules to set ownership and access permissions or ACLs of /dev/fw[0-9]+ character device files

**/sys/bus/fibre/devices/fw[0-9]+.[.][0-9]+/**

Defined on file *sysfs-bus-fibre*

IEEE 1394 unit device attributes. Read-only. Immutable during the unit device's lifetime. See IEEE 1212 for semantic definitions.

### **modalias**

Same as MODALIAS in the uevent at device creation.

### **rom\_index**

Offset of the unit directory within the parent device's (node device's) Configuration ROM, in quadlets. Decimal string representation.

**/sys/bus/fibre/drivers/sbp2/fw\*/host\*/target\*/\*/\*/\*/ieee1394\_id**

Defined on file *sysfs-bus-fibre*

SCSI target port identifier and logical unit identifier of a logical unit of an SBP-2 target. The identifiers are specified in SAM-2…SAM-4 annex A. They are persistent and world-wide unique properties the SBP-2 attached target.

Read-only attribute, immutable during the target's lifetime. Format, as exposed by fibre-sbp2 since 2.6.22, May 2007: Colon-separated hexadecimal string representations of

u64 EUI-64 : u24 directory\_ID : u16 LUN

without 0x prefixes, without whitespace. The former sbp2 driver (removed in 2.6.37 after being superseded by fibre-sbp2) used a somewhat shorter format which was not as close to SAM.

Users: udev rules to create /dev/disk/by-id/ symlinks

### /sys/bus/mhi/devices/…/oem\_pk\_hash

Defined on file *sysfs-bus-mhi*

The file holds the OEM PK Hash value of the endpoint device obtained using a BHI (Boot Host Interface) register read after at least one attempt to power up the device has been done. If read without having the device power on at least once, the file will read all 0' s.

Users: Any userspace application or clients interested in device info.

### /sys/bus/mhi/devices/…/serialnumber

Defined on file *sysfs-bus-mhi*

The file holds the serial number of the client device obtained using a BHI (Boot Host Interface) register read after at least one attempt to power up the device has been done. If read without having the device power on at least once, the file will read all 0' s.

Users: Any userspace application or clients interested in device info.

### /sys/bus/nvmem/devices/…/nvmem

Defined on file *sysfs-bus-nvmem*

This file allows user to read/write the raw NVMEM contents. Permissions for write to this file depends on the nvmem provider configuration. Note: This file is only present if CONFIG\_NVMEM\_SYSFS is enabled

ex:

```
hexdump /sys/bus/nvmem/devices/qfprom0/nvmem
00000000 0000 0000 0000 0000 0000 0000 0000 0000
*
000000a0 db10 2240 0000 e000 0c00 0c00 0000 0c00
00000000 0000 0000 0000 0000 0000 0000 0000 0000
...
*
0001000
```

### /sys/bus/pci/drivers/qla2xxx/…/devices/\*

Defined on file *sysfs-driver-qla2xxx*

qla2xxx-udev.sh currently looks for uevent CHANGE events to signal a firmware-dump has been generated by the driver and is ready for retrieval.

Users: qla2xxx-udev.sh. Proposed changes should be mailed to [linux-driver@qlogic.com](mailto:linux-driver@qlogic.com)

### **/sys/bus/platform/drivers/aspeed-vuart/\*/lpc\_address**

Defined on file [sysfs-driver-aspeed-vuart](#)

Configures which IO port the host side of the UART will appear on the host <-> BMC LPC bus.

Users: OpenBMC. Proposed changes should be mailed to [openbmc@lists.ozlabs.org](mailto:openbmc@lists.ozlabs.org)

### **/sys/bus/platform/drivers/aspeed-vuart/\*/sirq**

Defined on file [sysfs-driver-aspeed-vuart](#)

Configures which interrupt number the host side of the UART will appear on the host <-> BMC LPC bus.

Users: OpenBMC. Proposed changes should be mailed to [openbmc@lists.ozlabs.org](mailto:openbmc@lists.ozlabs.org)

### **/sys/bus/platform/drivers/aspeed-vuart/\*/sirq\_polarity**

Defined on file [sysfs-driver-aspeed-vuart](#)

Configures the polarity of the serial interrupt to the host via the BMC LPC bus. Set to 0 for active-low or 1 for active-high.

Users: OpenBMC. Proposed changes should be mailed to [openbmc@lists.ozlabs.org](mailto:openbmc@lists.ozlabs.org)

### **/sys/bus/usb/device/…/avoid\_reset\_quirk**

Defined on file [sysfs-bus-usb](#)

Writing 1 to this file tells the kernel that this device will morph into another mode when it is reset. Drivers will not use reset for error handling for such devices.

Users:

usb\_modeswitch

### **/sys/bus/usb/device/…/power/active\_duration**

Defined on file [sysfs-bus-usb](#)

If CONFIG\_PM is enabled, then this file is present. When read, it returns the total time (in msec) that the USB device has been active, i.e. not in a suspended state. This file is read-only.

Tools can use this file and the `connected_duration` file to compute the percentage of time that a device has been active. For example:

```
echo $((100 * `cat active_duration` / `cat connected_duration`))
```

will give an integer percentage. Note that this does not account for counter wrap.

Users:

PowerTOP <[powertop@lists.01.org](mailto:powertop@lists.01.org)> <https://01.org/powertop/>

---

**/sys/bus/usb/device/…/power/connected\_duration**

Defined on file *sysfs-bus-usb*

If CONFIG\_PM is enabled, then this file is present. When read, it returns the total time (in msec) that the USB device has been connected to the machine. This file is read-only.

Users:

PowerTOP <[powertop@lists.01.org](mailto:powertop@lists.01.org)> <https://01.org/powertop/>

---

**/sys/bus/usb/devices/…/bConfigurationValue**

Defined on file *sysfs-bus-usb*

bConfigurationValue of the *active* configuration for the device. Writing 0 or -1 to bConfigurationValue will reset the active configuration (unconfigure the device). Writing another value will change the active configuration.

Note that some devices, in violation of the USB spec, have a configuration with a value equal to 0. Writing 0 to bConfigurationValue for these devices will install that configuration, rather than unconfigure the device.

Writing -1 will always unconfigure the device.

Users:

libusb

---

**/sys/bus/usb/devices/…/busnum**

Defined on file *sysfs-bus-usb*

Bus-number of the USB-bus the device is connected to.

Users:

libusb

### /sys/bus/usb/devices/…/descriptors

Defined on file [sysfs-bus-usb](#)

Binary file containing cached descriptors of the device. The binary data consists of the device descriptor followed by the descriptors for each configuration of the device. Note that the wTotalLength of the config descriptors can not be trusted, as the device may have a smaller config descriptor than it advertises. The bLength field of each (sub) descriptor can be trusted, and can be used to seek forward one (sub) descriptor at a time until the next config descriptor is found. All descriptors read from this file are in bus-endian format

Users:

libusb

### /sys/bus/usb/devices/…/devnum

Defined on file [sysfs-bus-usb](#)

Device address on the USB bus.

Users:

libusb

### /sys/bus/usb/devices/…/power/autosuspend

Defined on file [sysfs-bus-usb](#)

Each USB device directory will contain a file named power/autosuspend. This file holds the time (in seconds) the device must be idle before it will be autosuspended. 0 means the device will be autosuspended as soon as possible. Negative values will prevent the device from being autosuspended at all, and writing a negative value will resume the device if it is already suspended.

The autosuspend delay for newly-created devices is set to the value of the usb-core.autosuspend module parameter.

### /sys/bus/usb/devices/…/power/persist

Defined on file [sysfs-bus-usb](#)

USB device directories can contain a file named power/persist. The file holds a boolean value (0 or 1) indicating whether or not the “USB-Persist” facility is enabled for the device. For hubs this facility is always enabled and their device directories will not contain this file.

For more information, see /driver-api/usb/persist.

---

**/sys/bus/usb/devices/…/speed**

Defined on file *sysfs-bus-usb*

Speed the device is connected with to the usb-host in Mbit / second. IE one of 1.5 / 12 / 480 / 5000.

Users:

libusb

---

**/sys/bus/usb/devices/<busnum>-<port[.port]>…:<config num>-<interface num>/supports\_autosuspend**

Defined on file *sysfs-bus-usb*

When read, this file returns 1 if the interface driver for this interface supports autosuspend. It also returns 1 if no driver has claimed this interface, as an unclaimed interface will not stop the device from being autosuspended if all other interface drivers are idle. The file returns 0 if autosuspend support has not been added to the driver.

Users:

USB PM tool git://git.moblin.org/users/sarah/usb-pm-tool/

---

**/sys/bus/usb/drivers/usbtmc/\*/interface\_capabilities  
/sys/bus/usb/drivers/usbtmc/\*/device\_capabilities**

Defined on file *sysfs-driver-usb-usbtmc*

These files show the various USB TMC capabilities as described by the device itself. The full description of the bitfields can be found in the USB TMC documents from the USB-IF entitled “Universal Serial Bus Test and Measurement Class Specification (USBTMC) Revision 1.0” section 4.2.1.8.

The files are read only.

---

**/sys/bus/usb/drivers/usbtmc/\*/usb488\_interface\_capabilities  
/sys/bus/usb/drivers/usbtmc/\*/usb488\_device\_capabilities**

Defined on file *sysfs-driver-usb-usbtmc*

These files show the various USB TMC capabilities as described by the device itself. The full description of the bitfields can be found in the USB TMC documents from the USB-IF entitled “Universal Serial Bus Test and Measurement Class, Subclass USB488 Specification (USBTMC-USB488) Revision 1.0” section 4.2.2.

The files are read only.

### **/sys/bus/vmbus/devices/<UUID>/channel\_vp\_mapping**

Defined on file *sysfs-bus-vmbus*

The mapping of which primary/sub channels are bound to which Virtual Processors. Format: <channel's child\_relid:>the bound cpu's number>

Users: tools/hv/lsvmbus

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>**

Defined on file *sysfs-bus-vmbus*

Directory for per-channel information NN is the VMBUS relid associated with the channel.

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/cpu**

Defined on file *sysfs-bus-vmbus*

VCPU (sub)channel is affinitized to

Users: tools/hv/lsvmbus and other debugging tools

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/events**

Defined on file *sysfs-bus-vmbus*

Number of times we have signaled the host

Users: Debugging tools

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/in\_mask**

Defined on file *sysfs-bus-vmbus*

Host to guest channel interrupt mask

Users: Debugging tools

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/interrupts**

Defined on file *sysfs-bus-vmbus*

Number of times we have taken an interrupt (incoming)

Users: Debugging tools

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/intr\_in\_full**

Defined on file *sysfs-bus-vmbus*

Number of guest to host interrupts caused by the inbound ring buffer transitioning from full to not full while a packet is waiting for buffer space to become available

Users: Debugging tools

---

**/sys/bus/vmbus/devices/<UUID>/channels/<N>/intr\_out\_empty**

---

Defined on file *sysfs-bus-vmbus*

Number of guest to host interrupts caused by the outbound ring buffer transitioning from empty to not empty

Users: Debugging tools

---

**/sys/bus/vmbus/devices/<UUID>/channels/<N>/latency**

---

Defined on file *sysfs-bus-vmbus*

Channel signaling latency. This file is available only for performance critical channels (storage, network, etc.) that use the monitor page mechanism.

Users: Debugging tools

---

**/sys/bus/vmbus/devices/<UUID>/channels/<N>/monitor\_id**

---

Defined on file *sysfs-bus-vmbus*

Monitor bit associated with channel. This file is available only for performance critical channels (storage, network, etc.) that use the monitor page mechanism.

Users: Debugging tools and userspace drivers

---

**/sys/bus/vmbus/devices/<UUID>/channels/<N>/out\_full\_first**

---

Defined on file *sysfs-bus-vmbus*

Number of write operations that were the first to encounter an outbound ring buffer full condition

Users: Debugging tools

---

**/sys/bus/vmbus/devices/<UUID>/channels/<N>/out\_full\_total**

---

Defined on file *sysfs-bus-vmbus*

Total number of write operations that encountered an outbound ring buffer full condition

Users: Debugging tools

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/out\_mask**

Defined on file *sysfs-bus-vmbus*

Guest to host channel interrupt mask

Users: Debugging tools

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/pending**

Defined on file *sysfs-bus-vmbus*

Channel interrupt pending state. This file is available only for performance critical channels (storage, network, etc.) that use the monitor page mechanism.

Users: Debugging tools

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/read\_avail**

Defined on file *sysfs-bus-vmbus*

Bytes available to read

Users: Debugging tools

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/ring**

Defined on file *sysfs-bus-vmbus*

Binary file created by uio\_hv\_generic for ring buffer

Users: Userspace drivers

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/subchannel\_id**

Defined on file *sysfs-bus-vmbus*

Subchannel ID associated with VMBUS channel

Users: Debugging tools and userspace drivers

### **/sys/bus/vmbus/devices/<UUID>/channels/<N>/write\_avail**

Defined on file *sysfs-bus-vmbus*

Bytes available to write

Users: Debugging tools

### **/sys/bus/vmbus/devices/<UUID>/class\_id**

Defined on file *sysfs-bus-vmbus*

The VMBus interface type GUID of the device

Users: tools/hv/lsvmbus

---

### **/sys/bus/vmbus/devices/<UUID>/device**

---

Defined on file *sysfs-bus-vmbus*

The 16 bit device ID of the device

Users: tools/hv/lsvmbus and user level RDMA libraries

---

### **/sys/bus/vmbus/devices/<UUID>/device\_id**

---

Defined on file *sysfs-bus-vmbus*

The VMBus interface instance GUID of the device

Users: tools/hv/lsvmbus

---

### **/sys/bus/vmbus/devices/<UUID>/id**

---

Defined on file *sysfs-bus-vmbus*

The VMBus child\_relid of the device's primary channel

Users: tools/hv/lsvmbus

---

### **/sys/bus/vmbus/devices/<UUID>/numa\_node**

---

Defined on file *sysfs-bus-vmbus*

This NUMA node to which the VMBUS device is attached, or -1 if the node is unknown.

---

### **/sys/bus/vmbus/devices/<UUID>/vendor**

---

Defined on file *sysfs-bus-vmbus*

The 16 bit vendor ID of the device

Users: tools/hv/lsvmbus and user level RDMA libraries

---

### **/sys/bus/w1/devices/…/eeprom**

---

Defined on file *sysfs-driver-w1\_ds28e04*

read/write the contents of the EEPROM memory of the DS28E04-100 see /w1/slaves/w1\_ds28e04 for detailed information

Users: any user space application which wants to communicate with DS28E04-100

### **/sys/bus/w1/devices/…/pio**

Defined on file *sysfs-driver-w1\_ds28e04*

read/write the contents of the two PIO's of the DS28E04-100 see /w1/slaves/w1\_ds28e04 for detailed information

Users: any user space application which wants to communicate with DS28E04-100

### **/sys/bus/w1/devices/…/w1\_master\_timeout\_us**

Defined on file *sysfs-bus-w1*

Bus scanning interval, microseconds component. Some of 1-Wire devices commonly associated with physical access control systems are attached/generate presence for as short as 100 ms - hence the tens-to-hundreds milliseconds scan intervals are required.

see /w1/w1-generic for detailed information.

Users: any user space application which wants to know bus scanning interval

### **/sys/bus/w1/devices/…/w1\_seq**

Defined on file *sysfs-driver-w1\_ds28ea00*

Support for the DS28EA00 chain sequence function see /w1/slaves/w1\_therm for detailed information

Users: any user space application which wants to communicate with DS28EA00

### **/sys/bus/xen-backend/devices/\*/devtype**

Defined on file *sysfs-bus-xen-backend*

The type of the device. e.g., one of: 'vbd' (block), 'vif' (network), or 'vfb' (framebuffer).

### **/sys/bus/xen-backend/devices/\*/nodename**

Defined on file *sysfs-bus-xen-backend*

XenStore node (under /local/domain/NNN/) for this backend device.

### **/sys/bus/xen-backend/devices/\*/state**

Defined on file *sysfs-bus-xen-backend*

The state of the device. One of: ‘Unknown’ , ‘Initialising’ , ‘Initialised’ , ‘Connected’ , ‘Closing’ , ‘Closed’ , ‘Reconfiguring’ , ‘Reconfigured’ .

---

**/sys/bus/xen-backend/devices/vbd-\*/mode**

Defined on file *sysfs-bus-xen-backend*

Whether the block device is read-only ( ‘r’ ) or read-write ( ‘w’ ).

---

**/sys/bus/xen-backend/devices/vbd-\*/physical\_device**

Defined on file *sysfs-bus-xen-backend*

The major:minor number (in hexadecimal) of the physical device providing the storage for this backend block device.

---

**/sys/bus/xen-backend/devices/vbd-\*/statistics/f\_req**

Defined on file *sysfs-bus-xen-backend*

Number of flush requests from the frontend.

---

**/sys/bus/xen-backend/devices/vbd-\*/statistics/oo\_req**

Defined on file *sysfs-bus-xen-backend*

Number of requests delayed because the backend was too busy processing previous requests.

---

**/sys/bus/xen-backend/devices/vbd-\*/statistics/rd\_req**

Defined on file *sysfs-bus-xen-backend*

Number of read requests from the frontend.

---

**/sys/bus/xen-backend/devices/vbd-\*/statistics/rd\_sect**

Defined on file *sysfs-bus-xen-backend*

Number of sectors read by the frontend.

---

**/sys/bus/xen-backend/devices/vbd-\*/statistics/wr\_req**

Defined on file *sysfs-bus-xen-backend*

Number of write requests from the frontend.

---

**/sys/bus/xen-backend/devices/vbd-\*/statistics/wr\_sect**

Defined on file *sysfs-bus-xen-backend*

Number of sectors written by the frontend.

### 5.1.4 Symbols under /sys/class

#### **/sys/class/backlight/<backlight>/actual\_brightness**

Defined on file *sysfs-class-backlight*

Show the actual brightness by querying the hardware.

Users: HAL

#### **/sys/class/backlight/<backlight>/bl\_power**

Defined on file *sysfs-class-backlight*

Control BACKLIGHT power, values are FB\_BLANK\_\* from fb.h

- FB\_BLANK\_UNBLANK (0) : power on.
- FB\_BLANK\_POWERDOWN (4) : power off

Users: HAL

#### **/sys/class/backlight/<backlight>/brightness**

Defined on file *sysfs-class-backlight*

Control the brightness for this <backlight>. Values are between 0 and max\_brightness. This file will also show the brightness level stored in the driver, which may not be the actual brightness (see actual\_brightness).

Users: HAL

#### **/sys/class/backlight/<backlight>/max\_brightness**

Defined on file *sysfs-class-backlight*

Maximum brightness for <backlight>.

Users: HAL

#### **/sys/class/backlight/<backlight>/type**

Defined on file *sysfs-class-backlight*

The type of interface controlled by <backlight>. “firmware” : The driver uses a standard firmware interface “platform” : The driver uses a platform-specific interface “raw” : The driver controls hardware registers directly

In the general case, when multiple backlight interfaces are available for a single device, firmware control should be preferred to platform control should be preferred to raw control. Using a firmware interface reduces the probability of confusion with the hardware and the OS independently updating the backlight state. Platform interfaces are mostly a holdover from pre-standardisation of firmware interfaces.

```
/sys/class/infiniband/<device-name>/hw_counters/lifespan  
/sys/class/infiniband/<device-name>/ports/<port-num>/hw_counters/lifespan
```

Defined on file *sysfs-class-infiniband*

The optional “hw\_counters” subdirectory can be under either the parent device or the port subdirectories or both. If present, there are a list of counters provided by the hardware. They may match some of the counters in the counters directory, but they often include many other counters. In addition to the various counters, there will be a file named “lifespan” that configures how frequently the core should update the counters when they are being accessed (counters are not updated if they are not being accessed). The lifespan is in milliseconds and defaults to 10 unless set to something else by the driver. Users may echo a value between 0-10000 to the lifespan file to set the length of time between updates in milliseconds.

```
/sys/class/infiniband/<device>/fw_ver
```

Defined on file *sysfs-class-infiniband*

(RO) Display firmware version

```
/sys/class/infiniband/<device>/node_desc
```

Defined on file *sysfs-class-infiniband*

(RW) Update the node description with information such as the node’ s hostname, so that IB network management software can tie its view to the real world.

```
/sys/class/infiniband/<device>/node_type  
/sys/class/infiniband/<device>/node_guid  
/sys/class/infiniband/<device>/sys_image_guid
```

Defined on file *sysfs-class-infiniband*

node_type:	(RO) Node type (CA, RNIC, usNIC, usNIC UDP, switch or router)
node_guid:	(RO) Node GUID
sys_image_guid:	(RO) System image GUID

```
/sys/class/infiniband/<device>/ports/<port-num>/counters/symbol_error

/sys/class/infiniband/<device>/ports/<port-num>/counters/link_error_recovery
/sys/class/infiniband/<device>/ports/<port-num>/counters/port_xmit_constraint_errors
/sys/class/infiniband/<device>/ports/<port-num>/counters/port_rcv_constraint_errors
/sys/class/infiniband/<device>/ports/<port-num>/counters/local_link_integrity_errors
/sys/class/infiniband/<device>/ports/<port-num>/counters/excessive_buffer_overrun_
/sys/class/infiniband/<device>/ports/<port-num>/counters/port_xmit_data
/sys/class/infiniband/<device>/ports/<port-num>/counters/port_rcv_data
/sys/class/infiniband/<device>/ports/<port-num>/counters/port_xmit_packets
/sys/class/infiniband/<device>/ports/<port-num>/counters/port_rcv_packets
/sys/class/infiniband/<device>/ports/<port-num>/counters/unicast_rcv_packets
/sys/class/infiniband/<device>/ports/<port-num>/counters/unicast_xmit_packets
/sys/class/infiniband/<device>/ports/<port-num>/counters/multicast_rcv_packets
/sys/class/infiniband/<device>/ports/<port-num>/counters/multicast_xmit_packets
/sys/class/infiniband/<device>/ports/<port-num>/counters/link_downded
/sys/class/infiniband/<device>/ports/<port-num>/counters/port_xmit_discards
/sys/class/infiniband/<device>/ports/<port-num>/counters/VL15_dropped
/sys/class/infiniband/<device>/ports/<port-num>/counters/port_xmit_wait
```

Defined on file *sysfs-class-infiniband*

#### Errors info:

symbol\_error: (RO) Total number of minor link errors detected on one or more physical lanes.

port\_rcv\_errors : (RO) Total number of packets containing an error that were received on the port.

port\_rcv\_remote\_physical\_errors : (RO) Total number of packets marked with the EBP delimiter received on the port.

port\_rcv\_switch\_relay\_errors : (RO) Total number of packets received on the port that were discarded because they could not be forwarded by the switch relay.

link\_error\_recovery: (RO) Total number of times the Port Training state machine has successfully completed the link error recovery process.

port\_xmit\_constraint\_errors: (RO) Total number of packets not transmitted from the switch physical port due to outbound raw filtering or failing outbound partition or IP version check.

port\_rcv\_constraint\_errors: (RO) Total number of packets received on the switch physical port that are discarded due to inbound raw filtering or failing inbound partition or IP version check.

local\_link\_integrity\_errors: (RO) The number of times that the count of local physical errors exceeded the threshold specified by LocalPhyErrors

excessive\_buffer\_overrun\_errors: (RO) This counter, indicates an input buffer overrun. It indicates possible misconfiguration of a port, either by the Subnet

Manager (SM) or by user intervention. It can also indicate hardware issues or extremely poor link signal integrity

#### **Data info:**

`port_xmit_data`: (RO) Total number of data octets, divided by 4 (lanes), transmitted on all VLs. This is 64 bit counter

`port_rcv_data`: (RO) Total number of data octets, divided by 4 (lanes), received on all VLs. This is 64 bit counter.

`port_xmit_packets`: (RO) Total number of packets transmitted on all VLs from this port. This may include packets with errors. This is 64 bit counter.

`port_rcv_packets`: (RO) Total number of packets (this may include packets containing Errors. This is 64 bit counter.

`link_downed`: (RO) Total number of times the Port Training state machine has failed the link error recovery process and downed the link.

`unicast_rcv_packets`: (RO) Total number of unicast packets, including unicast packets containing errors.

`unicast_xmit_packets`: (RO) Total number of unicast packets transmitted on all VLs from the port. This may include unicast packets with errors.

`multicast_rcv_packets`: (RO) Total number of multicast packets, including multi-cast packets containing errors.

`multicast_xmit_packets`: (RO) Total number of multicast packets transmitted on all VLs from the port. This may include multicast packets with errors.

#### **Misc info:**

`port_xmit_discards`: (RO) Total number of outbound packets discarded by the port because the port is down or congested.

`VL15_dropped`: (RO) Number of incoming VL15 packets dropped due to resource limitations (e.g., lack of buffers) of the port.

`port_xmit_wait`: (RO) The number of ticks during which the port had data to transmit but no data was sent during the entire tick (either because of insufficient credits or because of lack of arbitration).

Each of these files contains the corresponding value from the port's Performance Management PortCounters attribute, as described in the InfiniBand Architecture Specification.

<code>/sys/class/infiniband/&lt;device&gt;/ports/&lt;port-num&gt;/lid</code>

---

Defined on file *sysfs-class-infiniband*

---

sc2vl/: (RO) 32 files (0 - 31) used to translate sl->vl  
sl2sc/: (RO) 32 files (0 - 31) used to translate sl->sc  
vl2mtu/: (RO) 16 files (0 - 15) used to determine MTU for vl

---

---

**/sys/class/infiniband/hfi1\_X/sdma\_N/cpu\_list**  
**/sys/class/infiniband/hfi1\_X/sdma\_N/vl**

---

Defined on file *sysfs-class-infiniband*

sdma<N>/ contains one directory per sdma engine (0 - 15)

---

cpu\_list: (RW) List of cpus for user-process to sdma engine assignment.  
vl: (RO) Displays the virtual lane (vl) the sdma engine maps to.

---

This interface gives the user control on the affinity settings for the device. As an example, to set an sdma engine irq affinity and thread affinity of a user processes to use the sdma engine, which is “near” in terms of NUMA configuration, or physical cpu location, the user will do:

```
echo "3" > /proc/irq/<N>/smp_affinity_list
echo "4-7" > /sys/devices/.../sdma3/cpu_list
cat /sys/devices/.../sdma3/vl
0
echo "8" > /proc/irq/<M>/smp_affinity_list
echo "9-12" > /sys/devices/.../sdma4/cpu_list
cat /sys/devices/.../sdma4/vl
1
```

to make sure that when a process runs on cpus 4,5,6, or 7, and uses vl=0, then sdma engine 3 is selected by the driver, and also the interrupt of the sdma engine 3 is steered to cpu 3. Similarly, when a process runs on cpus 9,10,11, or 12 and sets vl=1, then engine 4 will be selected and the irq of the sdma engine 4 is steered to

cpu 8. This assumes that in the above N is the irq number of “sdma3” , and M is irq number of “sdma4” in the /proc/interrupts file.

```

---

Defined on file [sysfs-class-infiniband](#)

The sysfs iov directory is used to manage and examine the port P\_Key and guid paravirtualization. This directory is added only for the master - slaves do not have it.

Under iov/ports, the administrator may examine the gid and P\_Key tables as they are present in the device (and as are seen in the “network view” presented to the SM).

The “pkeys” and “gids” subdirectories contain one file for each entry in the port’s P\_Key or GID table respectively. For example, ports/1/pkeys/10 contains the value at index 10 in port 1’s P\_Key table.

```
gids/ (RO) The physical port gids n = 0..127
ad- (RW) Allows examining or changing the administrative state of a given
min_ GUID n = 0..127
pkey (RO) Displays the contents of the physical key table n = 0..126
mcg: (RO) Multicast group table
<m> (RO) Display the GID mapping m = 1..2
<m> (RW) Writable except for RoCE pkeys. m = 1..2, n = 0..126
Under the iov/<pci slot number> directories, the admin may map the index
numbers in the physical tables (as under iov/ports) to the paravirtualized
index numbers that guests see.
For example, if the administrator, for port 1 on guest 2 maps physical pkey
index 10 to virtual index 1, then that guest, whenever it uses its pkey index
1, will actually be using the real pkey index 10.
```

/sys/class/infiniband_mad/abi_version
---------------------------------------

---

Defined on file *sysfs-class-infiniband*

(RO) Value is incremented if any changes are made that break userspace ABI compatibility of umad & issm devices.

---

/sys/class/infiniband_mad/umadN/ibdev
/sys/class/infiniband_mad/umadN/port
/sys/class/infiniband_mad/issmN/ibdev
/sys/class/infiniband_mad/issmN/port

---

Defined on file *sysfs-class-infiniband*

Each port of each InfiniBand device has a “umad” device and an “issm” device attached. For example, a two-port HCA will have two umad devices and two issm devices, while a switch will have one device of each type (for switch port 0).

ibdev:	(RO) Show Infiniband (IB) device name
port:	(RO) Display port number

---

**/sys/class/infiniband\_srp/srp-<hca>-<port\_number>/add\_target**

---

Defined on file *sysfs-driver-ib\_srp*

Interface for making ib\_srp connect to a new target. One can request ib\_srp to connect to a new target by writing a comma-separated list of login parameters to this sysfs attribute. The supported parameters are:

- id\_ext, a 16-digit hexadecimal number specifying the eight byte identifier extension in the 16-byte SRP target port identifier. The target port identifier is sent by ib\_srp to the target in the SRP\_LOGIN\_REQ request.
- ioc\_guid, a 16-digit hexadecimal number specifying the eight byte I/O controller GUID portion of the 16-byte target port identifier.
- dgid, a 32-digit hexadecimal number specifying the destination GID.
- pkey, a four-digit hexadecimal number specifying the InfiniBand partition key.
- service\_id, a 16-digit hexadecimal number specifying the InfiniBand service ID used to establish communication with the SRP target. How to find out the value of the service ID is specified in the documentation of the SRP target.
- max\_sect, a decimal number specifying the maximum number of 512-byte sectors to be transferred via a single SCSI command.
- max\_cmd\_per\_lun, a decimal number specifying the maximum number of outstanding commands for a single LUN.
- io\_class, a hexadecimal number specifying the SRP I/O class. Must be either 0xff00 (rev 10) or 0x0100 (rev 16a). The I/O class defines the format of the SRP initiator and target port identifiers.
- initiator\_ext, a 16-digit hexadecimal number specifying the identifier extension portion of the SRP initiator port identifier. This data is sent by the initiator to the target in the SRP\_LOGIN\_REQ request.
- cmd\_sg\_entries, a number in the range 1..255 that specifies the maximum number of data buffer descriptors stored in the SRP\_CMD information unit itself. With allow\_ext\_sg=0 the parameter cmd\_sg\_entries defines the maximum S/G list length for a single SRP\_CMD, and commands whose S/G list length exceeds this limit after S/G list collapsing will fail.
- allow\_ext\_sg, whether ib\_srp is allowed to include a partial memory descriptor list in an SRP\_CMD instead of the entire list. If a partial memory descriptor list has been included in an SRP\_CMD the remaining memory descriptors are communicated from initiator to target via an additional RDMA transfer. Setting allow\_ext\_sg to 1 increases the maximum amount of data that can be transferred between initiator and target via a single SCSI command. Since not all SRP target implementations support partial memory descriptor lists the default value for this option is 0.

- sg\_tablesize, a number in the range 1..2048 specifying the maximum S/G list length the SCSI layer is allowed to pass to ib\_srp. Specifying a value that exceeds cmd\_sg\_entries is only safe with partial memory descriptor list support enabled (allow\_ext\_sg=1).
- comp\_vector, a number in the range 0..n-1 specifying the MSI-X completion vector of the first RDMA channel. Some HCA's allocate multiple (n) MSI-X vectors per HCA port. If the IRQ affinity masks of these interrupts have been configured such that each MSI-X interrupt is handled by a different CPU then the comp\_vector parameter can be used to spread the SRP completion workload over multiple CPU's.
- tl\_retry\_count, a number in the range 2..7 specifying the IB RC retry count.
- queue\_size, the maximum number of commands that the initiator is allowed to queue per SCSI host. The default value for this parameter is 62. The lowest supported value is 2.
- max\_it\_iu\_size, a decimal number specifying the maximum initiator to target information unit length.

---

**/sys/class/infiniband\_srp/srp-<hca>-<port\_number>/ibdev**

---

Defined on file *sysfs-driver-ib\_srp*

HCA name (<hca>).

---

**/sys/class/infiniband\_srp/srp-<hca>-<port\_number>/port**

---

Defined on file *sysfs-driver-ib\_srp*

HCA port number (<port\_number>).

---

**/sys/class/infiniband\_verbs/abi\_version**

---

Defined on file *sysfs-class-infiniband*

(RO) Value is incremented if any changes are made that break userspace ABI compatibility of uverbs devices.

sysfs interface for Mellanox IB HCA low-level driver (mthca)

---

**/sys/class/infiniband\_verbs/uverbsN/ibdev**  
**/sys/class/infiniband\_verbs/uverbsN/abi\_version**

---

Defined on file *sysfs-class-infiniband*

ibdev:	(RO) Display Infiniband (IB) device name
abi_version:	(RO) Show ABI version of IB device specific interfaces.

---

---

**/sys/class/rfkill**

Defined on file *sysfs-class-rfkill*

The rfkill class subsystem folder. Each registered rfkill driver is represented by an rfkillX subfolder (X being an integer  $\geq 0$ ).

---

**/sys/class/rfkill/rfkill[0-9]+/hard**

Defined on file *sysfs-class-rfkill*

Current hardblock state. This file is read only. Values: A numeric value.

**0: inactive**

The transmitter is (potentially) active.

**1: active**

The transmitter is forced off by something outside of the driver's control.

---

**/sys/class/rfkill/rfkill[0-9]+/name**

Defined on file *sysfs-class-rfkill*

Name assigned by driver to this key (interface or driver name). Values: arbitrary string.

---

**/sys/class/rfkill/rfkill[0-9]+/persistent**

Defined on file *sysfs-class-rfkill*

Whether the soft blocked state is initialised from non-volatile storage at startup. Values: A numeric value:

- 0: false
- 1: true

---

**/sys/class/rfkill/rfkill[0-9]+/soft**

Defined on file *sysfs-class-rfkill*

Current softblock state. This file is read and write. Values: A numeric value.

**0: inactive**

The transmitter is (potentially) active.

**1: active**

The transmitter is turned off by software.

---

**/sys/class/rfkill/rfkill[0-9]+/state**

Defined on file [sysfs-class-rfkill](#)

Current state of the transmitter. This file was scheduled to be removed in 2014, but due to its large number of users it will be sticking around for a bit longer. Despite it being marked as stable, the newer “hard” and “soft” interfaces should be preferred, since it is not possible to express the ‘soft and hard block’ state of the rfkill driver through this interface. There will likely be another attempt to remove it in the future. Values: A numeric value.

**0: RFKILL\_STATE\_SOFT\_BLOCKED**

transmitter is turned off by software

**1: RFKILL\_STATE\_UNBLOCKED**

transmitter is (potentially) active

**2: RFKILL\_STATE\_HARD\_BLOCKED**

transmitter is forced off by something outside of the driver’s control.

---

**/sys/class/rfkill/rfkill[0-9]+/type**

---

Defined on file [sysfs-class-rfkill](#)

Driver type string (“wlan”, “bluetooth”, etc). Values: See include/linux/rfkill.h.

---

**/sys/class/scsi\_host/host<n>/allow\_ext\_sg**

---

Defined on file [sysfs-driver-ib\\_srp](#)

Whether ib\_srp is allowed to include a partial memory descriptor list in an SRP\_CMD when communicating with an SRP target.

---

**/sys/class/scsi\_host/host<n>/ch\_count**

---

Defined on file [sysfs-driver-ib\\_srp](#)

Number of RDMA channels used for communication with the SRP target.

---

**/sys/class/scsi\_host/host<n>/cmd\_sg\_entries**

---

Defined on file [sysfs-driver-ib\\_srp](#)

Maximum number of data buffer descriptors that may be sent to the target in a single SRP\_CMD request.

---

**/sys/class/scsi\_host/host<n>/comp\_vector**

---

Defined on file [sysfs-driver-ib\\_srp](#)

Completion vector used for the first RDMA channel.

---

**/sys/class/scsi\_host/host<n>/dgid**

---

Defined on file *sysfs-driver-ib\_srp*

InfiniBand destination GID used for communication with the SRP target. Differs from orig\_dgid if port redirection has happened.

**/sys/class/scsi\_host/host<n>/id\_ext**

Defined on file *sysfs-driver-ib\_srp*

Eight-byte identifier extension portion of the 16-byte target port identifier.

**/sys/class/scsi\_host/host<n>/ioc\_guid**

Defined on file *sysfs-driver-ib\_srp*

Eight-byte I/O controller GUID portion of the 16-byte target port identifier.

**/sys/class/scsi\_host/host<n>/local\_ib\_device**

Defined on file *sysfs-driver-ib\_srp*

Name of the InfiniBand HCA used for communicating with the SRP target.

**/sys/class/scsi\_host/host<n>/local\_ib\_port**

Defined on file *sysfs-driver-ib\_srp*

Number of the HCA port used for communicating with the SRP target.

**/sys/class/scsi\_host/host<n>/orig\_dgid**

Defined on file *sysfs-driver-ib\_srp*

InfiniBand destination GID specified in the parameters written to the add\_target sysfs attribute.

**/sys/class/scsi\_host/host<n>/pkey**

Defined on file *sysfs-driver-ib\_srp*

A 16-bit number representing the InfiniBand partition key used for communication with the SRP target.

**/sys/class/scsi\_host/host<n>/req\_lim**

Defined on file *sysfs-driver-ib\_srp*

Number of requests ib\_srp can send to the target before it has to wait for more credits. For more information see also the SRP credit algorithm in the SRP specification.

### **/sys/class/scsi\_host/host<n>/service\_id**

Defined on file *sysfs-driver-ib\_srp*

InfiniBand service ID used for establishing communication with the SRP target.

### **/sys/class/scsi\_host/host<n>/sgid**

Defined on file *sysfs-driver-ib\_srp*

InfiniBand GID of the source port used for communication with the SRP target.

### **/sys/class/scsi\_host/host<n>/zero\_req\_lim**

Defined on file *sysfs-driver-ib\_srp*

Number of times the initiator had to wait before sending a request to the target because it ran out of credits. For more information see also the SRP credit algorithm in the SRP specification.

### **/sys/class/srp\_remote\_ports/port-<h>:<n>/delete**

Defined on file *sysfs-transport-srp*

Instructs an SRP initiator to disconnect from a target and to remove all LUNs imported from that target.

### **/sys/class/srp\_remote\_ports/port-<h>:<n>/dev\_loss\_tmo**

Defined on file *sysfs-transport-srp*

Number of seconds the SCSI layer will wait after a transport layer error has been observed before removing a target port. Zero means immediate removal. Setting this attribute to “off” will disable the dev\_loss timer.

### **/sys/class/srp\_remote\_ports/port-<h>:<n>/fast\_io\_fail\_tmo**

Defined on file *sysfs-transport-srp*

Number of seconds the SCSI layer will wait after a transport layer error has been observed before failing I/O. Zero means failing I/O immediately. Setting this attribute to “off” will disable the fast\_io\_fail timer.

### **/sys/class/srp\_remote\_ports/port-<h>:<n>/port\_id**

Defined on file *sysfs-transport-srp*

16-byte local SRP port identifier in hexadecimal format. An example:  
4c:49:4e:55:58:20:56:49:4f:00:00:00:00:00:00:00.

### /sys/class/srp\_remote\_ports/port-<h>:<n>/reconnect\_delay

Defined on file *sysfs-transport-srp*

Number of seconds the SCSI layer will wait after a reconnect attempt failed before retrying. Setting this attribute to “off” will disable time-based reconnecting.

### /sys/class/srp\_remote\_ports/port-<h>:<n>/roles

Defined on file *sysfs-transport-srp*

Role of the remote port. Either “SRP Initiator” or “SRP Target” .

### /sys/class/srp\_remote\_ports/port-<h>:<n>/state

Defined on file *sysfs-transport-srp*

State of the transport layer used for communication with the remote port. “running” if the transport layer is operational; “blocked” if a transport layer error has been encountered but the fast\_io\_fail\_tmo timer has not yet fired; “fail-fast” after the fast\_io\_fail\_tmo timer has fired and before the “dev\_loss\_tmo” timer has fired; “lost” after the “dev\_loss\_tmo” timer has fired and before the port is finally removed.

### /sys/class/tpm/tpmX/device/

Defined on file *sysfs-class-tpm*

The device/ directory under a specific TPM instance exposes the properties of that TPM chip

### /sys/class/tpm/tpmX/device/active

Defined on file *sysfs-class-tpm*

The “active” property prints a ‘1’ if the TPM chip is accepting commands. An inactive TPM chip still contains all the state of an active chip (Storage Root Key, NVRAM, etc), and can be visible to the OS, but will only accept a restricted set of commands. See the TPM Main Specification part 2, Structures, section 17 for more information on which commands are available.

### /sys/class/tpm/tpmX/device/cancel

Defined on file *sysfs-class-tpm*

The “cancel” property allows you to cancel the currently pending TPM command. Writing any value to cancel will call the TPM vendor specific cancel operation.

### **/sys/class/tpm/tpmX/device/caps**

Defined on file *sysfs-class-tpm*

The “caps” property contains TPM manufacturer and version info.

Example output:

```
Manufacturer: 0x53544d20
TCG version: 1.2
Firmware version: 8.16
```

Manufacturer is a hex dump of the 4 byte manufacturer info space in a TPM. TCG version shows the TCG TPM spec level that the chip supports. Firmware version is that of the chip and is manufacturer specific.

### **/sys/class/tpm/tpmX/device/durations**

Defined on file *sysfs-class-tpm*

The “durations” property shows the 3 vendor-specific values used to wait for a short, medium and long TPM command. All TPM commands are categorized as short, medium or long in execution time, so that the driver doesn’t have to wait any longer than necessary before starting to poll for a result.

Example output:

```
3015000 4508000 180995000 [original]
```

Here the short, medium and long durations are displayed in usecs. “[original]” indicates that the values are displayed unmodified from when they were queried from the chip. Durations can be modified in the case where a buggy chip reports them in msec instead of usec and they need to be scaled to be displayed in usecs. In this case “[adjusted]” will be displayed in place of “[original]” .

### **/sys/class/tpm/tpmX/device/enabled**

Defined on file *sysfs-class-tpm*

The “enabled” property prints a ‘1’ if the TPM chip is enabled, meaning that it should be visible to the OS. This property may be visible but produce a ‘0’ after some operation that disables the TPM.

### **/sys/class/tpm/tpmX/device/owned**

Defined on file *sysfs-class-tpm*

The “owned” property produces a ‘1’ if the TPM\_TakeOwnership ordinal has been executed successfully in the chip. A ‘0’ indicates that ownership hasn’t been taken.

### /sys/class/tpm/tpmX/device/pcrs

Defined on file *sysfs-class-tpm*

The “pcrs” property will dump the current value of all Platform Configuration Registers in the TPM. Note that since these values may be constantly changing, the output is only valid for a snapshot in time.

Example output:

```
PCR-00: 3A 3F 78 0F 11 A4 B4 99 69 FC AA 80 CD 6E 39 57 C3 3B 22 75
PCR-01: 3A 3F 78 0F 11 A4 B4 99 69 FC AA 80 CD 6E 39 57 C3 3B 22 75
PCR-02: 3A 3F 78 0F 11 A4 B4 99 69 FC AA 80 CD 6E 39 57 C3 3B 22 75
PCR-03: 3A 3F 78 0F 11 A4 B4 99 69 FC AA 80 CD 6E 39 57 C3 3B 22 75
PCR-04: 3A 3F 78 0F 11 A4 B4 99 69 FC AA 80 CD 6E 39 57 C3 3B 22 75
...
...
```

The number of PCRs and hex bytes needed to represent a PCR value will vary depending on TPM chip version. For TPM 1.1 and 1.2 chips, PCRs represent SHA-1 hashes, which are 20 bytes long. Use the “caps” property to determine TPM version.

### /sys/class/tpm/tpmX/device/pubek

Defined on file *sysfs-class-tpm*

The “pubek” property will return the TPM’s public endorsement key if possible. If the TPM has had ownership established and is version 1.2, the pubek will not be available without the owner’s authorization. Since the TPM driver doesn’t store any secrets, it can’t authorize its own request for the pubek, making it unaccessible. The public endorsement key is generated at TPM manufacture time and exists for the life of the chip.

Example output:

```
Algorithm: 00 00 00 01
Encscheme: 00 03
Sigscheme: 00 01

Sigscheme:	TPM_SS_NONE	(1)
Parameters, a byte string of 3 u32 values:		
Key Length (bits):	00 00 08 00	(2048)
Num primes:	00 00 00 02	(2)
Exponent Size:	00 00 00 00	(0 means the default exp)
Modulus Length:	256 (bytes)	
Modulus:	The 256 byte Endorsement Key modulus	

### **/sys/class/tpm/tpmX/device/temp\_deactivated**

Defined on file *sysfs-class-tpm*

The “temp\_deactivated” property returns a ‘1’ if the chip has been temporarily deactivated, usually until the next power cycle. Whether a warm boot (reboot) will clear a TPM chip from a temp\_deactivated state is platform specific.

### **/sys/class/tpm/tpmX/device/timeouts**

Defined on file *sysfs-class-tpm*

The “timeouts” property shows the 4 vendor-specific values for the TPM’s interface spec timeouts. The use of these timeouts is defined by the TPM interface spec that the chip conforms to.

Example output:

```
750000 750000 750000 750000 [original]
```

The four timeout values are shown in usecs, with a trailing “[original]” or “[adjusted]” depending on whether the values were scaled by the driver to be reported in usec from msecs.

---

**/sys/class/tpm/tpmX/tpm\_version\_major**

Defined on file *sysfs-class-tpm*

The “tpm\_version\_major” property shows the TCG spec major version implemented by the TPM device.

Example output:

```
2
```

---

**/sys/class/ubi/**

Defined on file *sysfs-class-ubi*

The ubi/ class sub-directory belongs to the UBI subsystem and provides general UBI information, per-UBI device information and per-UBI volume information.

---

**/sys/class/ubi/ubiX/avail\_eraseblocks**

Defined on file *sysfs-class-ubi*

Amount of available logical eraseblock. For example, one may create a new UBI volume which has this amount of logical eraseblocks.

---

**/sys/class/ubi/ubiX/bad\_peb\_count**

Defined on file *sysfs-class-ubi*

Count of bad physical eraseblocks on the underlying MTD device.

---

**/sys/class/ubi/ubiX/bgt\_enabled**

Defined on file *sysfs-class-ubi*

Contains ASCII “0n” if the UBI background thread is disabled, and ASCII “1n” if it is enabled.

---

**/sys/class/ubi/ubiX/dev**

Defined on file *sysfs-class-ubi*

Major and minor numbers of the character device corresponding to this UBI device (in <major>:<minor> format).

---

**/sys/class/ubi/ubiX/eraseblock\_size**

Defined on file *sysfs-class-ubi*

Maximum logical eraseblock size this UBI device may provide. UBI volumes may have smaller logical eraseblock size because of their alignment.

### **/sys/class/ubi/ubiX/max\_ec**

Defined on file *sysfs-class-ubi*

Maximum physical eraseblock erase counter value.

### **/sys/class/ubi/ubiX/max\_vol\_count**

Defined on file *sysfs-class-ubi*

Maximum number of volumes which this UBI device may have.

### **/sys/class/ubi/ubiX/min\_io\_size**

Defined on file *sysfs-class-ubi*

Minimum input/output unit size. All the I/O may only be done in fractions of the contained number.

### **/sys/class/ubi/ubiX/mtd\_num**

Defined on file *sysfs-class-ubi*

Number of the underlying MTD device.

### **/sys/class/ubi/ubiX/reserved\_for\_bad**

Defined on file *sysfs-class-ubi*

Number of physical eraseblocks reserved for bad block handling.

### **/sys/class/ubi/ubiX/ro\_mode**

Defined on file *sysfs-class-ubi*

Contains ASCII “1n” if the read-only flag is set on this device, and “On” if it is cleared. UBI devices mark themselves as read-only when they detect an unrecoverable error.

### **/sys/class/ubi/ubiX/total\_eraseblocks**

Defined on file *sysfs-class-ubi*

Total number of good (not marked as bad) physical eraseblocks on the underlying MTD device.

---

**/sys/class/ubi/ubiX/ubiX\_Y/**

Defined on file *sysfs-class-ubi*

The /sys/class/ubi/ubiX/ubiX\_0/, /sys/class/ubi/ubiX/ubiX\_1/, etc directories describe UBI volumes on UBI device X (volumes 0, 1, etc).

---

**/sys/class/ubi/ubiX/ubiX\_Y/alignment**

Defined on file *sysfs-class-ubi*

Volume alignment - the value the logical eraseblock size of this volume has to be aligned on. For example, 2048 means that logical eraseblock size is multiple of 2048. In other words, volume logical eraseblock size is UBI device logical eraseblock size aligned to the alignment value.

---

**/sys/class/ubi/ubiX/ubiX\_Y/corrupted**

Defined on file *sysfs-class-ubi*

Contains ASCII “On” if the UBI volume is OK, and ASCII “1n” if it is corrupted (e.g., due to an interrupted volume update).

---

**/sys/class/ubi/ubiX/ubiX\_Y/data\_bytes**

Defined on file *sysfs-class-ubi*

The amount of data this volume contains. This value makes sense only for static volumes, and for dynamic volume it equivalent to the total volume size in bytes.

---

**/sys/class/ubi/ubiX/ubiX\_Y/dev**

Defined on file *sysfs-class-ubi*

Major and minor numbers of the character device corresponding to this UBI volume (in <major>:<minor> format).

---

**/sys/class/ubi/ubiX/ubiX\_Y/name**

Defined on file *sysfs-class-ubi*

Volume name.

---

**/sys/class/ubi/ubiX/ubiX\_Y/reserved\_ebs**

Defined on file *sysfs-class-ubi*

Count of physical eraseblock reserved for this volume. Equivalent to the volume size in logical eraseblocks.

### **/sys/class/ubi/ubiX/ubiX\_Y/type**

Defined on file *sysfs-class-ubi*

Volume type. Contains ASCII “dynamicn” for dynamic volumes and “staticn” for static volumes.

### **/sys/class/ubi/ubiX/ubiX\_Y/upd\_marker**

Defined on file *sysfs-class-ubi*

Contains ASCII “0n” if the update marker is not set for this volume, and “1n” if it is set. The update marker is set when volume update starts, and cleaned when it ends. So the presence of the update marker indicates that the volume is being updated at the moment of the update was interrupted. The later may be checked using the “corrupted” sysfs file.

### **/sys/class/ubi/ubiX/ubiX\_Y/usable\_eb\_size**

Defined on file *sysfs-class-ubi*

Logical eraseblock size of this volume. Equivalent to logical eraseblock size of the device aligned on the volume alignment value.

### **/sys/class/ubi/ubiX/volumes\_count**

Defined on file *sysfs-class-ubi*

Count of volumes on this UBI device.

### **/sys/class/ubi/version**

Defined on file *sysfs-class-ubi*

This file contains version of the latest supported UBI on-media format. Currently it is 1, and there is no plan to change this. However, if in the future UBI needs on-flash format changes which cannot be done in a compatible manner, a new format version will be added. So this is a mechanism for possible future backward-compatible (but forward-incompatible) improvements.

### **/sys/class/ubiX/**

Defined on file *sysfs-class-ubi*

The /sys/class/ubi0, /sys/class/ubi1, etc directories describe UBI devices (UBI device 0, 1, etc). They contain general UBI device information and per UBI volume information (each UBI device may have many UBI volumes)

---

**/sys/class/udc/<udc>/a\_alt\_hnp\_support**

Defined on file *sysfs-class-udc*

Indicates if an OTG A-Host supports HNP at an alternate port.

---

**/sys/class/udc/<udc>/a\_hnp\_support**

Defined on file *sysfs-class-udc*

Indicates if an OTG A-Host supports HNP at this port.

---

**/sys/class/udc/<udc>/b\_hnp\_enable**

Defined on file *sysfs-class-udc*

Indicates if an OTG A-Host enabled HNP support.

---

**/sys/class/udc/<udc>/current\_speed**

Defined on file *sysfs-class-udc*

Indicates the current negotiated speed at this port.

---

**/sys/class/udc/<udc>/function**

Defined on file *sysfs-class-udc*

Prints out name of currently running USB Gadget Driver.

---

**/sys/class/udc/<udc>/is\_a\_peripheral**

Defined on file *sysfs-class-udc*

Indicates that this port is the default Host on an OTG session but HNP was used to switch roles.

---

**/sys/class/udc/<udc>/is\_otg**

Defined on file *sysfs-class-udc*

Indicates that this port support OTG.

---

**/sys/class/udc/<udc>/maximum\_speed**

Defined on file *sysfs-class-udc*

Indicates the maximum USB speed supported by this port.

**/sys/class/udc/<udc>/soft\_connect**

Defined on file *sysfs-class-udc*

Allows users to disconnect data pullup resistors thus causing a logical disconnection from the USB Host.

**/sys/class/udc/<udc>/srp**

Defined on file *sysfs-class-udc*

Allows users to manually start Session Request Protocol.

**/sys/class/udc/<udc>/state**

Defined on file *sysfs-class-udc*

Indicates current state of the USB Device Controller. Valid states are: ‘not-attached’ , ‘attached’ , ‘powered’ , ‘reconnecting’ , ‘unauthenticated’ , ‘default’ , ‘addressed’ , ‘configured’ , and ‘suspended’ ; however not all USB Device Controllers support reporting all states.

### 5.1.5 Symbols under /sys/devices

**/sys/devices/\*/devspec**

Defined on file *sysfs-devices*

If CONFIG\_OF is enabled, then this file is present. When read, it returns full name of the device node.

**/sys/devices/\*/obppath**

Defined on file *sysfs-devices*

If CONFIG\_OF is enabled, then this file is present. When read, it returns full name of the device node.

**/sys/devices/\*/of\_node**

Defined on file *sysfs-devices*

Any device associated with a device-tree node will have an of\_path symlink pointing to the corresponding device node in /sys/firmware/devicetree/

---

**/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/cap**

---

Defined on file *sysfs-driver-dma-ioatdma*

Capabilities the DMA supports. Currently there are DMA\_PQ, DMA\_PQ\_VAL, DMA\_XOR,DMA\_XOR\_VAL,DMA\_INTERRUPT.

---

**/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/intr\_coalesce**

---

Defined on file *sysfs-driver-dma-ioatdma*

Tune-able interrupt delay value per channel basis.

---

**/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/ring\_active**

---

Defined on file *sysfs-driver-dma-ioatdma*

The number of descriptors active in the ring.

---

**/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/ring\_size**

---

Defined on file *sysfs-driver-dma-ioatdma*

Descriptor ring size, total number of descriptors available.

---

**/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/version**

---

Defined on file *sysfs-driver-dma-ioatdma*

Version of ioatdma device.

---

**/sys/devices/platform/firmware\:zynqmp-firmware/ggs\***

---

Defined on file *sysfs-driver-firmware-zynqmp*

Read/Write PMU global general storage register value, GLOBAL\_GEN\_STORAGE{0:3}. Global general storage register that can be used by system to pass information between masters.

The register is reset during system or power-on resets. Three registers are used by the FSBL and other Xilinx software products: GLOBAL\_GEN\_STORAGE{4:6}.

Usage:

```
# cat /sys/devices/platform/firmware\:zynqmp-firmware/ggs0
# echo <value> > /sys/devices/platform/firmware\:zynqmp-firmware/
→ggs0
```

Example:

```
# cat /sys/devices/platform/firmware\:zynqmp-firmware/ggs0
# echo 0x1234ABCD > /sys/devices/platform/firmware\:zynqmp-firmware/
→ggs0
```

Users: Xilinx

### **/sys/devices/platform/firmware\:zynqmp-firmware/health\_status**

Defined on file *sysfs-driver-firmware-zynqmp*

This sysfs interface allows to set the health status. If PMUFW is compiled with CHECK\_HEALTHY\_BOOT, it will check the healthy bit on FPD WDT expiration. If healthy bit is set by a user application running in Linux, PMUFW will do APU only restart. If healthy bit is not set during FPD WDT expiration, PMUFW will do system restart.

Usage:

Set healthy bit:

```
# echo 1 > /sys/devices/platform/firmware\:zynqmp-firmware/health_
→status
```

Unset healthy bit:

```
# echo 0 > /sys/devices/platform/firmware\:zynqmp-firmware/health_
→status
```

Users: Xilinx

### **/sys/devices/platform/firmware\:zynqmp-firmware/pggs\***

Defined on file *sysfs-driver-firmware-zynqmp*

Read/Write PMU persistent global general storage register value, PERS\_GLOB\_GEN\_STORAGE{0:3}. Persistent global general storage register that can be used by system to pass information between masters.

This register is only reset by the power-on reset and maintains its value through a system reset. Four registers are used by the FSBL and other Xilinx software products: PERS\_GLOB\_GEN\_STORAGE{4:7}. Register is reset only by a POR reset.

Usage:

```
# cat /sys/devices/platform/firmware\:zynqmp-firmware/pggs0
# echo <value> > /sys/devices/platform/firmware\:zynqmp-firmware/
→pggs0
```

Example:

```
# cat /sys/devices/platform/firmware\:zynqmp-firmware/pggs0
# echo 0x1234ABCD > /sys/devices/platform/firmware\:zynqmp-firmware/
→pggs0
```

Users: Xilinx

### **/sys/devices/platform/firmware\:zynqmp-firmware/shutdown\_scope**

Defined on file *sysfs-driver-firmware-zynqmp*

This sysfs interface allows to set the shutdown scope for the next shutdown request. When the next shutdown is performed, the platform specific portion of PSCI-system\_off can use the chosen shutdown scope.

Following are available shutdown scopes(subtypes):

**subsystem:**

Only the APU along with all of its peripherals not used by other processing units will be shut down. This may result in the FPD power domain being shut down provided that no other processing unit uses FPD peripherals or DRAM.

**ps\_only:**

The complete PS will be shut down, including the RPU, PMU, etc. Only the PL domain (FPGA) remains untouched.

**system:**

The complete system/device is shut down.

Usage:

```
# cat /sys/devices/platform/firmware\:zynqmp-firmware/shutdown_scope
# echo <scope> > /sys/devices/platform/firmware\:zynqmp-firmware/
  ↪shutdown_scope
```

Example:

```
# cat /sys/devices/platform/firmware\:zynqmp-firmware/shutdown_scope
# echo "subsystem" > /sys/devices/platform/firmware\:zynqmp-
  ↪firmware/shutdown_scope
```

Users: Xilinx

### **/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/asic\_health**

Defined on file *sysfs-driver-mlxreg-io*

This file shows ASIC health status. The possible values are: 0 - health failed, 2 - health OK, 3 - ASIC in booting state.

The files are read only.

### **/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/config1 /sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/config2**

Defined on file *sysfs-driver-mlxreg-io*

These files show system static topology identification like system's static I2C topology, number and type of FPGA devices within the system and so on.

The files are read only.

```
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld1_pn  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld2_pn  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld3_pn  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld4_pn  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld1_version_min  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld2_version_min  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld3_version_min  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld4_version_min
```

---

Defined on file *sysfs-driver-mlxreg-io*

These files show with which CPLD part numbers and minor versions have been burned CPLD devices equipped on a system.

The files are read only.

```
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld1_version  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld2_version
```

---

Defined on file *sysfs-driver-mlxreg-io*

These files show with which CPLD versions have been burned on carrier and switch boards.

The files are read only.

```
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld3_version
```

---

Defined on file *sysfs-driver-mlxreg-io*

These files show with which CPLD versions have been burned on LED or Gearbox board.

The files are read only.

```
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld4_version
```

---

Defined on file *sysfs-driver-mlxreg-io*

These files show with which CPLD versions have been burned on LED board.

The files are read only.

```
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/fan_dir
```

---

Defined on file *sysfs-driver-mlxreg-io*

This file shows the system fans direction: forward direction - relevant bit is set 0; reversed direction - relevant bit is set 1.

The files are read only.

---

**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/jtag\_enable**

---

Defined on file *sysfs-driver-mlxreg-io*

These files enable and disable the access to the JTAG domain. By default access to the JTAG domain is disabled.

The file is read/write.

---

**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/pcie\_asic\_reset\_dis**

---

Defined on file *sysfs-driver-mlxreg-io*

This file allows to retain ASIC up during PCIe root complex reset, when attribute is set 1.

The file is read/write.

---

**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/psu1\_on**

---

Defined on file *sysfs-driver-mlxreg-io*

These files allow asserting system power cycling, switching power supply units on and off and system's main power domain shutdown. Expected behavior: When pwr\_cycle is written 1: auxiliary power domain will go down and after short period (about 1 second) up. When psu1\_on or psu2\_on is written 1, related unit will be disconnected from the power source, when written 0 - connected. If both are written 1 - power supplies main power domain will go down. When pwr\_down is written 1, system's main power domain will go down.

The files are write only.

---

**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/reset\_ac\_pwr\_fail**  
**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/reset\_platform**  
**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/reset\_soc**  
**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/reset\_sw\_pwr\_off**

---

Defined on file *sysfs-driver-mlxreg-io*

These files show the system reset causes, as following: reset due to AC power failure, reset invoked from software by assertion reset signal through CPLD. reset caused by signal asserted by SOC through ACPI register, reset invoked from software by assertion power off signal through CPLD.

The files are read only.

---

```
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_aux_pwr_or_ref  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_asic_thermal  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_hotswap_or_halt  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_hotswap_or_wd  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_fw_reset  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_long_pb  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_main_pwr_fail  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_short_pb  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_sw_reset
```

---

Defined on file [sysfs-driver-mlxreg-io](#)

These files show the system reset cause, as following: power auxiliary outage or power refresh, ASIC thermal shutdown, halt, hotswap, watchdog, firmware reset, long press power button, short press power button, software reset. Value 1 in file means this is reset cause, 0 - otherwise. Only one of the above causes could be 1 at the same time, representing only last reset cause.

The files are read only.

---

```
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_comex_pwr_fail  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_from_comex  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_system  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_voltmon_upgrade_fail
```

---

Defined on file [sysfs-driver-mlxreg-io](#)

These files show the system reset cause, as following: ComEx power fail, reset from ComEx, system platform reset, reset due to voltage monitor devices upgrade failure, Value 1 in file means this is reset cause, 0 - otherwise. Only one bit could be 1 at the same time, representing only the last reset cause.

The files are read only.

---

```
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_comex_thermal  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_comex_wd  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_from_asic  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_reload_bios  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_sff_wd  
/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_swb_wd
```

---

Defined on file [sysfs-driver-mlxreg-io](#)

These files show the system reset cause, as following: COMEX thermal shutdown; watchdog power off or reset was derived by one of the next components: COMEX, switch board or by Small Form Factor mezzanine, reset requested from ASIC, reset caused by BIOS reload. Value 1 in file means this is reset cause, 0 - otherwise. Only one of the above causes could be 1 at the same time, representing only last reset cause.

The files are read only.

---

**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/select\_iio**

Defined on file *sysfs-driver-mlxreg-io*

This file allows iio devices selection.

Attribute select\_iio can be written with 0 or with 1. It selects which one of iio devices can be accessed.

The file is read/write.

---

**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/ufm\_version**

Defined on file *sysfs-driver-mlxreg-io*

This file exposes the firmware version of burnable voltage regulator devices.

The file is read only.

---

**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/voltreg\_update\_status**

Defined on file *sysfs-driver-mlxreg-io*

This file exposes the configuration update status of burnable voltage regulator devices. The status values are as following: 0 - OK; 1 - CRC failure; 2 = I2C failure; 3 - in progress.

The file is read only.

---

**/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon\*/vpd\_wp**

Defined on file *sysfs-driver-mlxreg-io*

This file allows to overwrite system VPD hardware write protection when attribute is set 1.

The file is read/write.

---

**/sys/devices/system/cpu/cpu[0-9]+/dscr**

Defined on file *sysfs-devices-system-cpu*

Default value for the Data Stream Control Register (DSCR) on a CPU. This default value is used when the kernel is executing and for any process that has not set the DSCR itself. If a process ever sets the DSCR (via direct access to the SPR) that value will be persisted for that process and used on any CPU where it executes (overriding the value described here). If set by a process it will be inherited by child processes. Values: 64 bit unsigned integer (bit field)

---

**/sys/devices/system/cpu/dscr\_default**

Defined on file *sysfs-devices-system-cpu*

Writes are equivalent to writing to /sys/devices/system/cpu/cpuN/dscr on all CPUs. Reads return the last written value or 0. This value is not a global default: it is a way to set all per-CPU defaults at the same time. Values: 64 bit unsigned integer (bit field)

---

### **/sys/devices/system/node/has\_cpu**

---

Defined on file *sysfs-devices-node*

Nodes that have one or more CPUs.

---

### **/sys/devices/system/node/has\_high\_memory**

---

Defined on file *sysfs-devices-node*

Nodes that have regular or high memory. Depends on CONFIG\_HIGHMEM.

---

### **/sys/devices/system/node/has\_normal\_memory**

---

Defined on file *sysfs-devices-node*

Nodes that have regular memory.

---

### **/sys/devices/system/node/nodeX**

---

Defined on file *sysfs-devices-node*

When CONFIG\_NUMA is enabled, this is a directory containing information on node X such as what CPUs are local to the node. Each file is detailed next.

---

### **/sys/devices/system/node/nodeX/accessY/**

---

Defined on file *sysfs-devices-node*

The node's relationship to other nodes for access class "Y".

---

### **/sys/devices/system/node/nodeX/accessY/initiators/**

---

Defined on file *sysfs-devices-node*

The directory containing symlinks to memory initiator nodes that have class "Y" access to this target node's memory. CPUs and other memory initiators in nodes not in the list accessing this node's memory may have different performance.

---

### **/sys/devices/system/node/nodeX/accessY/initiators/read\_bandwidth**

---

Defined on file *sysfs-devices-node*

This node's read bandwidth in MB/s when accessed from nodes found in this access class' s linked initiators.

---

**/sys/devices/system/node/nodeX/accessY/initiators/read\_latency**

---

Defined on file *sysfs-devices-node*

This node' s read latency in nanoseconds when accessed from nodes found in this access class' s linked initiators.

---

**/sys/devices/system/node/nodeX/accessY/initiators/write\_bandwidth**

---

Defined on file *sysfs-devices-node*

This node' s write bandwidth in MB/s when accessed from found in this access class' s linked initiators.

---

**/sys/devices/system/node/nodeX/accessY/initiators/write\_latency**

---

Defined on file *sysfs-devices-node*

This node' s write latency in nanoseconds when access from nodes found in this class' s linked initiators.

---

**/sys/devices/system/node/nodeX/accessY/targets/**

---

Defined on file *sysfs-devices-node*

The directory containing symlinks to memory targets that this initiator node has class "Y" access.

---

**/sys/devices/system/node/nodeX/compact**

---

Defined on file *sysfs-devices-node*

When this file is written to, all memory within that node will be compacted. When it completes, memory will be freed into blocks which have as many contiguous pages as possible

---

**/sys/devices/system/node/nodeX/cpulist**

---

Defined on file *sysfs-devices-node*

The CPUs associated to the node.

---

**/sys/devices/system/node/nodeX/cpumap**

---

Defined on file *sysfs-devices-node*

The node's cpumap.

### **/sys/devices/system/node/nodeX/distance**

Defined on file *sysfs-devices-node*

Distance between the node and all the other nodes in the system.

### **/sys/devices/system/node/nodeX/hugepages/hugepages-<size>/**

Defined on file *sysfs-devices-node*

The node's huge page size control/query attributes. See *HugeTLB Pages*

### **/sys/devices/system/node/nodeX/meminfo**

Defined on file *sysfs-devices-node*

Provides information about the node's distribution and memory utilization. Similar to /proc/meminfo, see /filesystems/proc

### **/sys/devices/system/node/nodeX/memory\_side\_cache/indexY/**

Defined on file *sysfs-devices-node*

The directory containing attributes for the memory-side cache level 'Y' .

### **/sys/devices/system/node/nodeX/memory\_side\_cache/indexY/indexing**

Defined on file *sysfs-devices-node*

The caches associativity indexing: 0 for direct mapped, non-zero if indexed.

### **/sys/devices/system/node/nodeX/memory\_side\_cache/indexY/line\_size**

Defined on file *sysfs-devices-node*

The number of bytes accessed from the next cache level on a cache miss.

### **/sys/devices/system/node/nodeX/memory\_side\_cache/indexY/size**

Defined on file *sysfs-devices-node*

The size of this memory side cache in bytes.

### **/sys/devices/system/node/nodeX/memory\_side\_cache/indexY/write\_policy**

Defined on file *sysfs-devices-node*

The cache write policy: 0 for write-back, 1 for write-through, other or unknown.

---

**/sys/devices/system/node/nodeX/numastat**

Defined on file *sysfs-devices-node*

The node's hit/miss statistics, in units of pages. See *Numa policy hit/miss statistics*

---

**/sys/devices/system/node/nodeX/vmstat**

Defined on file *sysfs-devices-node*

The node's zoned virtual memory statistics. This is a superset of numastat.

---

**/sys/devices/system/node/online**

Defined on file *sysfs-devices-node*

Nodes that are online.

---

**/sys/devices/system/node/possible**

Defined on file *sysfs-devices-node*

Nodes that could be possibly become online at some point.

---

**/sys/devices/system/xen\_memory/xen\_memory0/info/current\_kb**

Defined on file *sysfs-devices-system-xen\_memory*

Current size (in KiB) of this domain's memory reservation.

---

**/sys/devices/system/xen\_memory/xen\_memory0/info/high\_kb**

Defined on file *sysfs-devices-system-xen\_memory*

Amount (in KiB) of high memory in the balloon.

---

**/sys/devices/system/xen\_memory/xen\_memory0/info/low\_kb**

Defined on file *sysfs-devices-system-xen\_memory*

Amount (in KiB) of low (or normal) memory in the balloon.

---

**/sys/devices/system/xen\_memory/xen\_memory0/max\_retry\_count**

Defined on file *sysfs-devices-system-xen\_memory*

The maximum number of times the balloon driver will attempt to increase the balloon before giving up. See also ‘retry\_count’ below. A value of zero means retry forever and is the default one.

### **/sys/devices/system/xen\_memory/xen\_memory0/max\_schedule\_delay**

Defined on file *sysfs-devices-system-xen\_memory*

The limit that ‘schedule\_delay’ (see below) will be increased to. The default value is 32 seconds.

### **/sys/devices/system/xen\_memory/xen\_memory0/retry\_count**

Defined on file *sysfs-devices-system-xen\_memory*

The current number of times that the balloon driver has attempted to increase the size of the balloon. The default value is one. With max\_retry\_count being zero (unlimited), this means that the driver will attempt to retry with a ‘schedule\_delay’ delay.

### **/sys/devices/system/xen\_memory/xen\_memory0/schedule\_delay**

Defined on file *sysfs-devices-system-xen\_memory*

The time (in seconds) to wait between attempts to increase the balloon. Each time the balloon cannot be increased, ‘schedule\_delay’ is increased (until ‘max\_schedule\_delay’ is reached at which point it will use the max value).

### **/sys/devices/system/xen\_memory/xen\_memory0/scrub\_pages**

Defined on file *sysfs-devices-system-xen\_memory*

Control scrubbing pages before returning them to Xen for others domains use. Can be set with xen\_scrub\_pages cmdline parameter. Default value controlled with CONFIG\_XEN\_SCRUB\_PAGES\_DEFAULT.

### **/sys/devices/system/xen\_memory/xen\_memory0/target**

Defined on file *sysfs-devices-system-xen\_memory*

The target number of pages to adjust this domain’s memory reservation to.

### **/sys/devices/system/xen\_memory/xen\_memory0/target\_kb**

Defined on file *sysfs-devices-system-xen\_memory*

As target above, except the value is in KiB.

### 5.1.6 Symbols under /sys/firmware

#### /sys/firmware/acpi/pm\_profile

Defined on file *sysfs-acpi-pmprofile*

The ACPI pm\_profile sysfs interface exports the platform power management (and performance) requirement expectations as provided by BIOS. The integer value is directly passed as retrieved from the FADT ACPI table.

**Values: For possible values see ACPI specification:**

5.2.9 Fixed ACPI Description Table (FADT) Field: Preferred\_PM\_Profile

Currently these values are defined by spec:

0	Unspecified
1	Desktop
2	Mobile
3	Workstation
4	Enterprise Server
5	SOHO Server
6	Appliance PC
7	Performance Server
>7	Reserved

#### /sys/firmware/efi/vars

Defined on file *sysfs-firmware-efi-vars*

This directory exposes interfaces for interactive with EFI variables. For more information on EFI variables, see ‘Variable Services’ in the UEFI specification (section 7.2 in specification version 2.3 Errata D).

In summary, EFI variables are named, and are classified into separate namespaces through the use of a vendor GUID. They also have an arbitrary binary value associated with them.

The efivars module enumerates these variables and creates a separate directory for each one found. Each directory has a name of the form “<key>-<vendor guid>” and contains the following files:

at-trib	A read-only text file enumerating the EFI variable flags. Potential values include: EFI_VARIABLE_NON_VOLATILE EFI_VARIABLE_RUNTIME_ACCESS EFI_VARIABLE_HARDWARE_ERROR_RECORD EFI_VARIABLE_AUTHENTICATED_WRITE_ACCESS See the EFI documentation for an explanation of each of these variables.
data	A read-only binary file that can be read to attain the value of the EFI variable
guid	The vendor GUID of the variable. This should always match the GUID in the variable's name.
raw	A binary file that can be read to obtain a structure that contains everything there is to know about the variable. For structure definition see “struct efi_variable” in the kernel sources. This file can also be written to in order to update the value of a variable. For this to work however, all fields of the “struct efi_variable” passed must match byte for byte with the structure read out of the file, save for the value portion. <b>Note</b> the efi_variable structure read/written with this file contains a ‘long’ type that may change widths depending on your underlying architecture.
size	As ASCII representation of the size of the variable's value.

In addition, two other magic binary files are provided in the top-level directory and are used for adding and removing variables:

new_v	Takes a “struct efi_variable” and instructs the EFI firmware to create a new variable.
del_v	Takes a “struct efi_variable” and instructs the EFI firmware to remove any variable that has a matching vendor GUID and variable key name.

### /sys/firmware/opal/dump

Defined on file [sysfs-firmware-opal-dump](#)

This directory exposes interfaces for interacting with the FSP and platform dumps through OPAL firmware interface.

This is only for the powerpc/powernv platform.

init	When ‘1’ is written to it, we will initiate a dump. Read this file for supported commands.
atet_0xXX	A directory for dump of type 0xXX and id 0xYYYY (in hex). The name of this directory should not be relied upon to be in this format, only that it's unique among all dumps. For determining the type and ID of the dump, use the id and type files. Do not rely on any particular size of dump type or dump id.

Each dump has the following files:

id:	An ASCII representation of the dump ID in hex (e.g. ‘0x01’ )
type:	An ASCII representation of the type of dump in the format “0x% <i>x</i> %s” with the ID in hex and a description of the dump type (or ‘unknown’ ). Type ‘0xffffffff unknown’ is used when we could not get the type from firmware. e.g. ‘0x02 System/Platform Dump’
dump	A binary file containing the dump. The size of the dump is the size of this file.
ac-	When ‘ack’ is written to this, we will acknowledge that we’ve retrieved know the dump to the service processor. It will then remove it, making the dump edge inaccessible. Reading this file will get a list of supported actions.

## /sys/firmware/opal/elog

Defined on file [sysfs-firmware-opal-elog](#)

This directory exposes error log entries retrieved through the OPAL firmware interface.

Each error log is identified by a unique ID and will exist until explicitly acknowledged to firmware.

Each log entry has a directory in [/sys/firmware/opal/elog](#).

Log entries may be purged by the service processor before retrieved by firmware or retrieved/acknowledged by Linux if there is no room for more log entries.

In the event that Linux has retrieved the log entries but not explicitly acknowledged them to firmware and the service processor needs more room for log entries, the only remaining copy of a log message may be in Linux.

Typically, a user space daemon will monitor for new entries, read them out and acknowledge them.

The service processor may be able to store more log entries than firmware can, so after you acknowledge an event from Linux you may instantly get another one from the queue that was generated some time in the past.

The raw log format is a binary format. We currently do not parse this at all in kernel, leaving it up to user space to solve the problem. In future, we may do more parsing in kernel and add more files to make it easier for simple user space processes to extract more information.

For each log entry (directory), there are the following files:

id:	An ASCII representation of the ID of the error log, in hex - e.g. “0x01” .
type:	An ASCII representation of the type id and description of the type of error log. Currently just “0x00 PEL” - platform error log. In the future there may be additional types.
raw:	A read-only binary file that can be read to get the raw log entry. These are <16kb, often just hundreds of bytes and “average” 2kb.

ac- Writing ‘ack’ to this file will acknowledge the error log to firmware (and know in turn the service processor, if applicable). Shortly after acknowledging edge it, the log entry will be removed from sysfs. Reading this file will list the supported operations (currently just acknowledge).

---

### 5.1.7 Symbols under /sys/fs

#### /sys/fs/o2cb/ (was /sys/o2cb)

Defined on file *o2cb*

Ocfs2-tools looks at ‘interface-revision’ for versioning information. Each logmask/file controls a set of debug prints and can be written into with the strings “allow”, “deny”, or “off”. Reading the file returns the current state.

Users: ocfs2-tools. It’s sufficient to mail proposed changes to [ocfs2-devel@oss.oracle.com](mailto:ocfs2-devel@oss.oracle.com).

#### /sys/fs/orangefs/acache/\*

Defined on file *sysfs-fs-orangefs*

Attribute cache configurable settings.

#### /sys/fs/orangefs/capcache/\*

Defined on file *sysfs-fs-orangefs*

Capability cache configurable settings.

#### /sys/fs/orangefs/ccache/\*

Defined on file *sysfs-fs-orangefs*

Credential cache configurable settings.

#### /sys/fs/orangefs/ncache/\*

Defined on file *sysfs-fs-orangefs*

Name cache configurable settings.

### **/sys/fs/orangefs/op\_timeout\_secs**

Defined on file *sysfs-fs-orangefs*

Service operation timeout in seconds.

### **/sys/fs/orangefs/perf\_counter\_reset**

Defined on file *sysfs-fs-orangefs*

echo a 0 or a 1 into perf\_counter\_reset to reset all the counters in /sys/fs/orangefs/perf\_counters except ones with PINT\_PERF\_PRESERVE set.

### **/sys/fs/orangefs/perf\_counters/\***

Defined on file *sysfs-fs-orangefs*

Counters and settings for various caches. Read only.

### **/sys/fs/orangefs/perf\_history\_size**

Defined on file *sysfs-fs-orangefs*

The perf\_counters cache statistics have N, or perf\_history\_size, samples. The default is one.

Every perf\_time\_interval\_secs the (first) samples are reset.

If N is greater than one, the “current” set of samples is reset, and the samples from the other N-1 intervals remain available.

### **/sys/fs/orangefs/perf\_time\_interval\_secs**

Defined on file *sysfs-fs-orangefs*

Length of perf counter intervals in seconds.

### **/sys/fs/orangefs/slot\_timeout\_secs**

Defined on file *sysfs-fs-orangefs*

“Slot” timeout in seconds. A “slot” is an indexed buffer in the shared memory segment used for communication between the kernel module and userspace. Slots are requested and waited for, the wait times out after slot\_timeout\_secs.

### 5.1.8 Symbols under /sys/hypervisor

#### /sys/hypervisor/compilation/compile\_date

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Contains the build time stamp of the Xen hypervisor Might return “<denied>” in case of special security settings in the hypervisor.

#### /sys/hypervisor/compilation/compiled\_by

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Contains information who built the Xen hypervisor Might return “<denied>” in case of special security settings in the hypervisor.

#### /sys/hypervisor/compilation/compiler

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Compiler which was used to build the Xen hypervisor Might return “<denied>” in case of special security settings in the hypervisor.

#### /sys/hypervisor/properties/capabilities

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Space separated list of supported guest system types. Each type is in the format: <class>-<major>.<minor>-<arch> With:

```
<cla "xen" - x86: paravirtualized, arm: standard "hvm" - x86 only:  
    fully virtualized  
<ma major guest interface version  
<mi minor guest interface version  
<arc architecture, e.g.: "x86_32" : 32 bit x86 guest without PAE  
    "x86_32p" : 32 bit x86 guest with PAE "x86_64" : 64 bit x86  
    guest "armv7l" : 32 bit arm guest "aarch64" : 64 bit arm guest
```

#### /sys/hypervisor/properties/changeset

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Changeset of the hypervisor (git commit) Might return “<denied>” in case of special security settings in the hypervisor.

#### /sys/hypervisor/properties/features

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Features the Xen hypervisor supports for the guest as defined in include/xen/interface/features.h printed as a hex value.

---

**/sys/hypervisor/properties/pagesize**

---

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Default page size of the hypervisor printed as a hex value. Might return “0” in case of special security settings in the hypervisor.

---

**/sys/hypervisor/properties/virtual\_start**

---

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Virtual address of the hypervisor as a hex value.

---

**/sys/hypervisor/type**

---

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Type of hypervisor: “xen” : Xen hypervisor

---

**/sys/hypervisor/uuid**

---

Defined on file *sysfs-hypervisor-xen*

If running under Xen: UUID of the guest as known to the Xen hypervisor.

---

**/sys/hypervisor/version/extra**

---

Defined on file *sysfs-hypervisor-xen*

If running under Xen: The Xen version is in the format <major>.<minor><extra>. This is the <extra> part of it. Might return “<denied>” in case of special security settings in the hypervisor.

---

**/sys/hypervisor/version/major**

---

Defined on file *sysfs-hypervisor-xen*

If running under Xen: The Xen version is in the format <major>.<minor><extra>. This is the <major> part of it.

---

**/sys/hypervisor/version/minor**

---

Defined on file *sysfs-hypervisor-xen*

If running under Xen: The Xen version is in the format <major>. <minor><extra>  
This is the <minor> part of it.

### 5.1.9 Symbols under /sys/kernel

#### /sys/kernel/notes

Defined on file *sysfs-kernel-notes*

The */sys/kernel/notes* file contains the binary representation of the running vm-linux' s .notes section.

### 5.1.10 Symbols under /sys/module

#### /sys/module

Defined on file *sysfs-module*

The */sys/module* tree consists of the following structure:

##### /sys/module/MODULENAME

The name of the module that is in the kernel. This module name will always show up if the module is loaded as a dynamic module. If it is built directly into the kernel, it will only show up if it has a version or at least one parameter.

Note: The conditions of creation in the built-in case are not by design and may be removed in the future.

##### /sys/module/MODULENAME/parameters

This directory contains individual files that are each individual parameters of the module that are able to be changed at runtime. See the individual module documentation as to the contents of these parameters and what they accomplish.

Note: The individual parameter names and values are not considered stable, only the fact that they will be placed in this location within sysfs. See the individual driver documentation for details as to the stability of the different parameters.

##### /sys/module/MODULENAME/refcnt

If the module is able to be unloaded from the kernel, this file will contain the current reference count of the module.

Note: If the module is built into the kernel, or if the CONFIG\_MODULE\_UNLOAD kernel configuration value is not enabled, this file will not be present.

### 5.1.11 A notification mechanism for thermal related events

#### A notification mechanism for thermal related events

Defined on file [thermal-notification](#)

This interface enables notification for thermal related events. The notification is in the form of a netlink event.

### 5.1.12 The kernel syscall interface

#### The kernel syscall interface

Defined on file [syscalls](#)

This interface matches much of the POSIX interface and is based on it and other Unix based interfaces. It will only be added to over time, and not have things removed from it.

Note that this interface is different for every architecture that Linux supports. Please see the architecture-specific documentation for details on the syscall numbers that are to be mapped to each syscall.

### 5.1.13 vDSO

#### vDSO

Defined on file [vdso](#)

On some architectures, when the kernel loads any userspace program it maps an ELF DSO into that program's address space. This DSO is called the vDSO and it often contains useful and highly-optimized alternatives to real syscalls.

These functions are called just like ordinary C function according to your platform's ABI. Call them from a sensible context. (For example, if you set CS on x86 to something strange, the vDSO functions are within their rights to crash.) In addition, if you pass a bad pointer to a vDSO function, you might get SIGSEGV instead of -EFAULT.

To find the DSO, parse the auxiliary vector passed to the program's entry point. The AT\_SYSINFO\_EHDR entry will point to the vDSO.

The vDSO uses symbol versioning; whenever you request a symbol from the vDSO, specify the version you are expecting.

Programs that dynamically link to glibc will use the vDSO automatically. Otherwise, you can use the reference parser in tools/testing/selftests/vDSO/parse\_vdso.c.

Unless otherwise noted, the set of symbols with any given version and the ABI of those symbols is considered stable. It may vary across architectures, though.

**Note:**

As of this writing, this ABI documentation has been confirmed for x86\_64. The maintainers of the other vDSO-using architectures should confirm that it is correct for their architecture.

### **5.1.14 File stable/firewire-cdev**

Has the following ABI:

- */dev/fw[0-9]+*

### **5.1.15 File stable/o2cb**

Has the following ABI:

- */sys/fs/o2cb/ (was /sys/o2cb)*

### **5.1.16 File stable/syscalls**

Has the following ABI:

- *The kernel syscall interface*

### **5.1.17 File stable/sysfs-acpi-pmprofile**

Has the following ABI:

- */sys/firmware/acpi/pm\_profile*

### **5.1.18 File stable/sysfs-bus-firewire**

Has the following ABI:

- */sys/bus/firewire/devices/fw[0-9]+/*
- */sys/bus/firewire/devices/fw[0-9]+/units*
- */sys/bus/firewire/devices/fw[0-9]+/is\_local*
- */sys/bus/firewire/devices/fw[0-9]+.[.][0-9]+/*
- */sys/bus/firewire/devices/\*/*
- */sys/bus/firewire/drivers/sbp2/fw\*/host\*/target\*/\*.\*.\*/\*ieee1394\_id*

### 5.1.19 File stable/sysfs-bus-mhi

Has the following ABI:

- `/sys/bus/mhi/devices/…/serialnumber`
- `/sys/bus/mhi/devices/…/oem_pk_hash`

### 5.1.20 File stable/sysfs-bus-nvmmem

Has the following ABI:

- `/sys/bus/nvmmem/devices/…/nvmmem`

### 5.1.21 File stable/sysfs-bus-usb

Has the following ABI:

- `/sys/bus/usb/devices/…/power/persist`
- `/sys/bus/usb/devices/…/power/autosuspend`
- `/sys/bus/usb/device/…/power/connected_duration`
- `/sys/bus/usb/device/…/power/active_duration`
- `/sys/bus/usb/devices/<busnum>-<port[.port]>…:<config num>-<interface num>/supports_autosuspend`
- `/sys/bus/usb/device/…/avoid_reset_quirk`
- `/sys/bus/usb/devices/…/devnum`
- `/sys/bus/usb/devices/…/bConfigurationValue`
- `/sys/bus/usb/devices/…/busnum`
- `/sys/bus/usb/devices/…/descriptors`
- `/sys/bus/usb/devices/…/speed`

### 5.1.22 File stable/sysfs-bus-vmbus

Has the following ABI:

- `/sys/bus/vmbus/devices/<UUID>/id`
- `/sys/bus/vmbus/devices/<UUID>/class_id`
- `/sys/bus/vmbus/devices/<UUID>/device_id`
- `/sys/bus/vmbus/devices/<UUID>/channel_vp_mapping`
- `/sys/bus/vmbus/devices/<UUID>/device`
- `/sys/bus/vmbus/devices/<UUID>/vendor`
- `/sys/bus/vmbus/devices/<UUID>/numa_node`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>`

- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/cpu`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/in_mask`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/latency`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/out_mask`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/pending`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/read_avail`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/write_avail`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/events`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/interrupts`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/subchannel_id`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/monitor_id`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/ring`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/intr_in_full`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/intr_out_empty`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/out_full_first`
- `/sys/bus/vmbus/devices/<UUID>/channels/<N>/out_full_total`

### 5.1.23 File stable/sysfs-bus-w1

Has the following ABI:

- `/sys/bus/w1/devices/…/w1_master_timeout_us`

### 5.1.24 File stable/sysfs-bus-xen-backend

Has the following ABI:

- `/sys/bus/xen-backend/devices/*/devtype`
- `/sys/bus/xen-backend/devices/*/nodename`
- `/sys/bus/xen-backend/devices/vbd-*/*physical_device`
- `/sys/bus/xen-backend/devices/vbd-*/*mode`
- `/sys/bus/xen-backend/devices/vbd-*/*statistics/f_req`
- `/sys/bus/xen-backend/devices/vbd-*/*statistics/oo_req`
- `/sys/bus/xen-backend/devices/vbd-*/*statistics/rd_req`
- `/sys/bus/xen-backend/devices/vbd-*/*statistics/rd_sect`
- `/sys/bus/xen-backend/devices/vbd-*/*statistics/wr_req`
- `/sys/bus/xen-backend/devices/vbd-*/*statistics/wr_sect`
- `/sys/bus/xen-backend/devices/*/*state`

### 5.1.25 File stable/sysfs-class-backlight

Has the following ABI:

- `/sys/class/backlight/<backlight>/bl_power`
- `/sys/class/backlight/<backlight>/brightness`
- `/sys/class/backlight/<backlight>/actual_brightness`
- `/sys/class/backlight/<backlight>/max_brightness`
- `/sys/class/backlight/<backlight>/type`

### 5.1.26 File stable/sysfs-class-infiniband

sysfs interface common for all infiniband devices

Has the following ABI:

- `/sys/class/infiniband/<device>/node_type`
- `/sys/class/infiniband/<device>/node_guid`
- `/sys/class/infiniband/<device>/sys_image_guid`
- `/sys/class/infiniband/<device>/node_desc`
- `/sys/class/infiniband/<device>/fw_ver`
- `/sys/class/infiniband/<device>/ports/<port-num>/lid`
- `/sys/class/infiniband/<device>/ports/<port-num>/rate`
- `/sys/class/infiniband/<device>/ports/<port-num>/lid_mask_count`
- `/sys/class/infiniband/<device>/ports/<port-num>/sm_sl`
- `/sys/class/infiniband/<device>/ports/<port-num>/sm_lid`
- `/sys/class/infiniband/<device>/ports/<port-num>/state`
- `/sys/class/infiniband/<device>/ports/<port-num>/phys_state`
- `/sys/class/infiniband/<device>/ports/<port-num>/cap_mask`

### 5.1.27 File stable/sysfs-class-rfkill

rfkill - radio frequency (RF) connector kill switch support

For details to this subsystem look at /driver-api/rfkill.

For the deprecated `/sys/class/rfkill/*/claim` knobs of this interface look in [removed/sysfs-class-rfkill](#).

Has the following ABI:

- `/sys/class/rfkill`
- `/sys/class/rfkill/rfkill[0-9]+/name`
- `/sys/class/rfkill/rfkill[0-9]+/type`
- `/sys/class/rfkill/rfkill[0-9]+/persistent`
- `/sys/class/rfkill/rfkill[0-9]+/state`
- `/sys/class/rfkill/rfkill[0-9]+/hard`
- `/sys/class/rfkill/rfkill[0-9]+/soft`

### 5.1.28 File stable/sysfs-class-tpm

Has the following ABI:

- `/sys/class/tpm/tpmX/device/`
- `/sys/class/tpm/tpmX/device/active`
- `/sys/class/tpm/tpmX/device/cancel`
- `/sys/class/tpm/tpmX/device/caps`
- `/sys/class/tpm/tpmX/device/durations`
- `/sys/class/tpm/tpmX/device/enabled`
- `/sys/class/tpm/tpmX/device/owned`
- `/sys/class/tpm/tpmX/device/pcrs`

- */sys/class/tpm/tpmX/device/pubek*
- */sys/class/tpm/tpmX/device/temp\_deactivated*
- */sys/class/tpm/tpmX/device/timeouts*
- */sys/class/tpm/tpmX/tpm\_version\_major*

### 5.1.29 File stable/sysfs-class-ubi

Has the following ABI:

- */sys/class/ubi/*
- */sys/class/ubi/version*
- */sys/class/ubiX/*
- */sys/class/ubi/ubiX/avail\_eraseblocks*
- */sys/class/ubi/ubiX/bad\_peb\_count*
- */sys/class/ubi/ubiX/bgt\_enabled*
- */sys/class/ubi/ubiX/dev*
- */sys/class/ubi/ubiX/eraseblock\_size*
- */sys/class/ubi/ubiX/max\_ec*
- */sys/class/ubi/ubiX/max\_vol\_count*
- */sys/class/ubi/ubiX/min\_io\_size*
- */sys/class/ubi/ubiX/mtd\_num*
- */sys/class/ubi/ubiX/reserved\_for\_bad*
- */sys/class/ubi/ubiX/ro\_mode*
- */sys/class/ubi/ubiX/total\_eraseblocks*
- */sys/class/ubi/ubiX/volumes\_count*
- */sys/class/ubi/ubiX/ubiX\_Y/*
- */sys/class/ubi/ubiX/ubiX\_Y/alignment*
- */sys/class/ubi/ubiX/ubiX\_Y/corrupted*
- */sys/class/ubi/ubiX/ubiX\_Y/data\_bytes*
- */sys/class/ubi/ubiX/ubiX\_Y/dev*
- */sys/class/ubi/ubiX/ubiX\_Y/name*
- */sys/class/ubi/ubiX/ubiX\_Y/reserved\_ebs*
- */sys/class/ubi/ubiX/ubiX\_Y/type*
- */sys/class/ubi/ubiX/ubiX\_Y/upd\_marker*
- */sys/class/ubi/ubiX/ubiX\_Y/usable\_eb\_size*

### 5.1.30 File stable/sysfs-class-udc

Has the following ABI:

- `/sys/class/udc/<udc>/a_alt_hnp_support`
- `/sys/class/udc/<udc>/a_hnp_support`
- `/sys/class/udc/<udc>/b_hnp_enable`
- `/sys/class/udc/<udc>/current_speed`
- `/sys/class/udc/<udc>/is_a_peripheral`
- `/sys/class/udc/<udc>/is_otg`
- `/sys/class/udc/<udc>/maximum_speed`
- `/sys/class/udc/<udc>/soft_connect`
- `/sys/class/udc/<udc>/srp`
- `/sys/class/udc/<udc>/state`
- `/sys/class/udc/<udc>/function`

### 5.1.31 File stable/sysfs-devices

#### Note:

This documents additional properties of any device beyond what is documented in [Rules on how to access information in sysfs](#)

Has the following ABI:

- `/sys/devices/*/of_node`
- `/sys/devices/*/devspec`
- `/sys/devices/*/obppath`

### 5.1.32 File stable/sysfs-devices-node

Has the following ABI:

- `/sys/devices/system/node/possible`
- `/sys/devices/system/node/online`
- `/sys/devices/system/node/has_normal_memory`
- `/sys/devices/system/node/has_cpu`
- `/sys/devices/system/node/has_high_memory`
- `/sys/devices/system/node/nodeX`
- `/sys/devices/system/node/nodeX/cpumap`
- `/sys/devices/system/node/nodeX/cpulist`
- `/sys/devices/system/node/nodeX/meminfo`

- `/sys/devices/system/node/nodeX/numastat`
- `/sys/devices/system/node/nodeX/distance`
- `/sys/devices/system/node/nodeX/vmstat`
- `/sys/devices/system/node/nodeX/compact`
- `/sys/devices/system/node/nodeX/hugepages/hugepages-<size>/`
- `/sys/devices/system/node/nodeX/accessY/`
- `/sys/devices/system/node/nodeX/accessY/initiators/`
- `/sys/devices/system/node/nodeX/accessY/targets/`
- `/sys/devices/system/node/nodeX/accessY/initiators/read_bandwidth`
- `/sys/devices/system/node/nodeX/accessY/initiators/read_latency`
- `/sys/devices/system/node/nodeX/accessY/initiators/write_bandwidth`
- `/sys/devices/system/node/nodeX/accessY/initiators/write_latency`
- `/sys/devices/system/node/nodeX/memory_side_cache/indexY/`
- `/sys/devices/system/node/nodeX/memory_side_cache/indexY/indexing`
- `/sys/devices/system/node/nodeX/memory_side_cache/indexY/line_size`
- `/sys/devices/system/node/nodeX/memory_side_cache/indexY/size`
- `/sys/devices/system/node/nodeX/memory_side_cache/indexY/write_policy`

### 5.1.33 File stable/sysfs-devices-system-cpu

Has the following ABI:

- `/sys/devices/system/cpu/dscr_default`
- `/sys/devices/system/cpu/cpu[0-9]+/dscr`

### 5.1.34 File stable/sysfs-devices-system-xen\_memory

Has the following ABI:

- `/sys/devices/system/xen_memory/xen_memory0/max_retry_count`
- `/sys/devices/system/xen_memory/xen_memory0/max_schedule_delay`
- `/sys/devices/system/xen_memory/xen_memory0/retry_count`
- `/sys/devices/system/xen_memory/xen_memory0/schedule_delay`
- `/sys/devices/system/xen_memory/xen_memory0/target`
- `/sys/devices/system/xen_memory/xen_memory0/target_kb`
- `/sys/devices/system/xen_memory/xen_memory0/info/current_kb`
- `/sys/devices/system/xen_memory/xen_memory0/info/high_kb`
- `/sys/devices/system/xen_memory/xen_memory0/info/low_kb`

- `/sys/devices/system/xen_memory/xen_memory0/scrub_pages`

### 5.1.35 File stable/sysfs-driver-aspeed-vuart

Has the following ABI:

- `/sys/bus/platform/drivers/aspeed-vuart/*/lpc_address`
- `/sys/bus/platform/drivers/aspeed-vuart/*/sirq`
- `/sys/bus/platform/drivers/aspeed-vuart/*/sirq_polarity`

### 5.1.36 File stable/sysfs-driver-dma-idxd

Has the following ABI:

- `/sys/bus/dsa/devices/dsa<m>/version`
- `/sys/bus/dsa/devices/dsa<m>/cdev_major`
- `/sys/bus/dsa/devices/dsa<m>/errors`
- `/sys/bus/dsa/devices/dsa<m>/max_batch_size`
- `/sys/bus/dsa/devices/dsa<m>/max_work_queues_size`
- `/sys/bus/dsa/devices/dsa<m>/max_engines`
- `/sys/bus/dsa/devices/dsa<m>/max_groups`
- `/sys/bus/dsa/devices/dsa<m>/max_tokens`
- `/sys/bus/dsa/devices/dsa<m>/max_transfer_size`
- `/sys/bus/dsa/devices/dsa<m>/max_work_queues`
- `/sys/bus/dsa/devices/dsa<m>/numa_node`
- `/sys/bus/dsa/devices/dsa<m>/op_cap`
- `/sys/bus/dsa/devices/dsa<m>/state`
- `/sys/bus/dsa/devices/dsa<m>/group<m>.n>`
- `/sys/bus/dsa/devices/dsa<m>/engine<m>.n>`
- `/sys/bus/dsa/devices/dsa<m>/wq<m>.n>`
- `/sys/bus/dsa/devices/dsa<m>/configurable`
- `/sys/bus/dsa/devices/dsa<m>/token_limit`
- `/sys/bus/dsa/devices/dsa<m>/cmd_status`
- `/sys/bus/dsa/devices/wq<m>.n>/group_id`
- `/sys/bus/dsa/devices/wq<m>.n>/size`
- `/sys/bus/dsa/devices/wq<m>.n>/type`
- `/sys/bus/dsa/devices/wq<m>.n>/cdev_minor`
- `/sys/bus/dsa/devices/wq<m>.n>/mode`

- `/sys/bus/dsa/devices/wq<m>.<n>/priority`
- `/sys/bus/dsa/devices/wq<m>.<n>/state`
- `/sys/bus/dsa/devices/wq<m>.<n>/threshold`
- `/sys/bus/dsa/devices/wq<m>.<n>/max_transfer_size`
- `/sys/bus/dsa/devices/wq<m>.<n>/max_batch_size`
- `/sys/bus/dsa/devices/engine<m>.<n>/group_id`

### 5.1.37 File stable/sysfs-driver-dma-ioatdma

Has the following ABI:

- `/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/cap`
- `/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/ring_active`
- `/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/ring_size`
- `/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/version`
- `/sys/devices/pciXXXX:XX/0000:XX:XX.X/dma/dma<n>chan<n>/quickdata/intr_coalesce`

### 5.1.38 File stable/sysfs-driver-firmware-zynqmp

Has the following ABI:

- `/sys/devices/platform/firmware\zynqmp-firmware/ggs*`
- `/sys/devices/platform/firmware\zynqmp-firmware/pggs*`
- `/sys/devices/platform/firmware\zynqmp-firmware/shutdown_scope`
- `/sys/devices/platform/firmware\zynqmp-firmware/health_status`

### 5.1.39 File stable/sysfs-driver-ib\_srp

Has the following ABI:

- `/sys/class/infiniband_srp/srp-<hca>-<port_number>/add_target`
- `/sys/class/infiniband_srp/srp-<hca>-<port_number>/ibdev`
- `/sys/class/infiniband_srp/srp-<hca>-<port_number>/port`
- `/sys/class/scsi_host/host<n>/allow_ext_sg`
- `/sys/class/scsi_host/host<n>/ch_count`
- `/sys/class/scsi_host/host<n>/cmd_sg_entries`
- `/sys/class/scsi_host/host<n>/comp_vector`
- `/sys/class/scsi_host/host<n>/dgid`
- `/sys/class/scsi_host/host<n>/id_ext`
- `/sys/class/scsi_host/host<n>/ioc_guid`

- `/sys/class/scsi_host/host<n>/local_ib_device`
- `/sys/class/scsi_host/host<n>/local_ib_port`
- `/sys/class/scsi_host/host<n>/orig_dgid`
- `/sys/class/scsi_host/host<n>/pkey`
- `/sys/class/scsi_host/host<n>/req_lim`
- `/sys/class/scsi_host/host<n>/service_id`
- `/sys/class/scsi_host/host<n>/sgid`
- `/sys/class/scsi_host/host<n>/zero_req_lim`

### 5.1.40 File stable/sysfs-driver-mlxreg-io

Has the following ABI:

- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/asic_health`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld1_version`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld2_version`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/fan_dir`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld3_version`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/jtag_enable`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/select_iio`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/psu1_on`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_aux_pwr_or_ref`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_asic_thermal`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_hotswap_or_halt`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_hotswap_or_wd`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_fw_reset`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_long_pb`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_main_pwr_fail`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_short_pb`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_sw_reset`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_comex_pwr_fail`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_from_comex`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_system`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_voltmon_upgrade_fail`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/cpld4_version`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_comex_thermal`

- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_comex_wd`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_from_asic`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_reload_bios`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_sff_wd`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_swb_wd`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/config1`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/config2`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_ac_pwr_fail`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_platform`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_soc`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/reset_sw_pwr_off`
- `/sys/devices/platform/mlxplat/mlxreg-io/hwmon/hwmon*/pcie_asic_reset_dis`

- */sys/class/srp\_remote\_ports/port-<h>:<n>/state*

### **5.1.54 File stable/thermal-notification**

Has the following ABI:

- *A notification mechanism for thermal related events*

### **5.1.55 File stable/vdso**

Has the following ABI:

- *vDSO*

## 5.2 ABI testing symbols

Documents interfaces that are felt to be stable, as the main development of this interface has been completed.

The interface can be changed to add new features, but the current interface will not break by doing this, unless grave errors or security problems are found in them.

Userspace programs can start to rely on these interfaces, but they must be aware of changes that can occur before these interfaces move to be marked stable.

Programs that use these interfaces are strongly encouraged to add their name to the description of these interfaces, so that the kernel developers can easily notify them if any changes occur.

### 5.2.1 Symbols under /config/acpi

#### /config/acpi

Defined on file *configfs-acpi*

This represents the ACPI subsystem entry point directory. It contains sub-groups corresponding to ACPI configurable options.

#### /config/acpi/table

Defined on file *configfs-acpi*

This group contains the configuration for user defined ACPI tables. The attributes of a user define table are:

##### aml

- a binary attribute that the user can use to fill in the ACPI aml definitions. Once the aml data is written to this file and the file is closed the table will be loaded and ACPI devices will be enumerated. To check if the operation is successful the user must check the error code for close(). If the operation is successful, subsequent writes to this attribute will fail.

The rest of the attributes are read-only and are valid only after the table has been loaded by filling the aml entry:

##### signature

- ASCII table signature

##### length

- length of table in bytes, including the header

##### revision

- ACPI Specification minor version number

### **`oem_id`**

- ASCII OEM identification

### **`oem_table_id`**

- ASCII OEM table identification

### **`oem_revision`**

- OEM revision number

### **`asl_compiler_id`**

- ASCII ASL compiler vendor ID

### **`asl_compiler_revision`**

- ASL compiler version

## 5.2.2 Symbols under `/config/iio`

### **`/config/iio`**

Defined on file *configfs-iio*

This represents Industrial IO configuration entry point directory. It contains sub-groups corresponding to IIO objects.

### **`/config/iio/devices`**

Defined on file *configfs-iio*

Industrial IO software devices directory.

### **`/config/iio/devices/dummy`**

Defined on file *configfs-iio*

Dummy IIO devices directory. Creating a directory here will result in creating a dummy IIO device in the IIO subsystem.

### **`/config/iio/triggers`**

Defined on file *configfs-iio*

Industrial IO software triggers directory.

### **`/config/iio/triggers/hrtimers`**

Defined on file *configfs-iio*

High resolution timers directory. Creating a directory here will result in creating a hrtimer trigger in the IIO subsystem.

### 5.2.3 Symbols under /config/pcie-gadget

#### /config/pcie-gadget

Defined on file *configfs-spear-pcie-gadget*

Interface is used to configure selected dual mode PCIe controller as device and then program its various registers to configure it as a particular device type. This interfaces can be used to show spear' s PCIe device capability.

Nodes are only visible when configfs is mounted. To mount configfs in /config directory use:

```
# mount -t configfs none /config/
```

For nth PCIe Device Controller /config/pcie-gadget.n/:

link	used to enable ltssm and read its status.
int_type	used to configure and read type of supported interrupt
no_of_msi	used to configure number of MSI vector needed and to read no of MSI granted.
inta	write 1 to assert INTA and 0 to de-assert.
send_msi	write MSI vector to be sent.
vendor_id	used to write and read vendor id (hex)
device_id	used to write and read device id (hex)
bar0_size	used to write and read bar0_size
bar0_address	used to write and read bar0 mapped area in hex.
bar0_rw_offset	used to write and read offset of bar0 where bar0_data will be written or read.
bar0_data	used to write and read data at bar0_rw_offset.

### 5.2.4 Symbols under /config/rdma\_cm

#### /config/rdma\_cm

Defined on file *configfs-rdma\_cm*

Interface is used to configure RDMA-cable HCAs in respect to RDMA-CM attributes.

Attributes are visible only when configfs is mounted. To mount configfs in /config directory use: # mount -t configfs none /config/

In order to set parameters related to a specific HCA, a directory for this HCA has to be created: mkdir -p /config/rdma\_cm/<hca>

### /config/rdma\_cm/<hca>/ports/<port-num>/default\_roce\_mode

Defined on file *configfs-rdma\_cm*

RDMA-CM based connections from HCA <hca> at port <port-num> will be initiated with this RoCE type as default. The possible RoCE types are either “IB/RoCE v1” or “RoCE v2”. This parameter has RW access.

### /config/rdma\_cm/<hca>/ports/<port-num>/default\_roce\_tos

Defined on file *configfs-rdma\_cm*

RDMA-CM QPs from HCA <hca> at port <port-num> will be created with this TOS as default. This can be overridden by using the rdma\_set\_option API. The possible RoCE TOS values are 0-255.

## 5.2.5 Symbols under /config/stp-policy

### /config/stp-policy

Defined on file *configfs-stp-policy*

This group contains policies mandating Master/Channel allocation for software sources wishing to send trace data over an STM device.

### /config/stp-policy/<device>.<policy>

Defined on file *configfs-stp-policy*

This group is the root of a policy; its name is a concatenation of an stm device name to which this policy applies and an arbitrary string. If <device> part doesn’t match an existing stm device, mkdir will fail with ENODEV; if that device already has a policy assigned to it, mkdir will fail with EBUSY.

### /config/stp-policy/<device>.<policy>/<node>

Defined on file *configfs-stp-policy*

Policy node is a string identifier that software clients will use to request a master/channel to be allocated and assigned to them.

### /config/stp-policy/<device>.<policy>/<node>/channels

Defined on file *configfs-stp-policy*

Range of channels from which to allocate for users of this node. Write two numbers: the first channel and the last channel number.

**/config/stp-policy/<device>.<policy>/<node>/masters**

Defined on file *configfs-stp-policy*

Range of masters from which to allocate for users of this node. Write two numbers: the first master and the last master number.

**/config/stp-policy/<device>.<policy>/device**

Defined on file *configfs-stp-policy*

STM device to which this policy applies, read only. Same as the <device> component of its parent directory.

**/config/stp-policy/<device>:p\_sys-t.<policy>/<node>/clocksync\_interval**

Defined on file *configfs-stp-policy-p\_sys-t*

Time interval in milliseconds. Send a CLOCKSYNC packet if this many milliseconds have passed since the previous CLOCKSYNC packet from this source. Zero is the default and stands for “never send the CLOCKSYNC”. It makes sense to use this option with sources that generate constant and/or periodic data, like `stm_heartbeat`.

**/config/stp-policy/<device>:p\_sys-t.<policy>/<node>/do\_len**

Defined on file *configfs-stp-policy-p\_sys-t*

Include payload length in the MIPI SyS-T header, boolean. If enabled, the SyS-T protocol encoder will include payload length in each packet’s metadata. This is normally redundant if the underlying transport protocol supports marking message boundaries (which STP does), so this is off by default.

**/config/stp-policy/<device>:p\_sys-t.<policy>/<node>/ts\_interval**

Defined on file *configfs-stp-policy-p\_sys-t*

Time interval in milliseconds. Include a timestamp in the MIPI SyS-T packet metadata, if this many milliseconds have passed since the previous packet from this source. Zero is the default and stands for “never send the timestamp”.

**/config/stp-policy/<device>:p\_sys-t.<policy>/<node>/uuid**

Defined on file *configfs-stp-policy-p\_sys-t*

UUID source identifier string, RW. Default value is randomly generated at the `mkdir <node>` time. Data coming from trace sources that use this <node> will be tagged with this UUID in the MIPI SyS-T packet stream, to allow the decoder

to discern between different sources within the same master/channel range, and identify the higher level decoders that may be needed for each source.

### 5.2.6 Symbols under /config/usb-gadget

#### /config/usb-gadget

Defined on file *configfs-usb-gadget*

This group contains sub-groups corresponding to created USB gadgets.

#### /config/usb-gadget/gadget

Defined on file *configfs-usb-gadget*

The attributes of a gadget:

UDC	bind a gadget to UDC/unbind a gadget; write UDC' s name found in /sys/class/udc/* to bind a gadget, empty string “” to unbind.
max_speed	maximum speed the driver supports. Valid names are super-speed-plus, super-speed, high-speed, full-speed, and low-speed.
bDevice-Class	USB device class code
bDevice-SubClass	USB device subclass code
bDevice-Protocol	USB device protocol code
bMax-Packet-Size0	maximum endpoint 0 packet size
bcdDevice	bcd device release number
bcdUSB	bcd USB specification version number
idProduct	product ID
idVendor	vendor ID

#### /config/usb-gadget/gadget/configs

Defined on file *configfs-usb-gadget*

This group contains a USB gadget' s configurations

#### /config/usb-gadget/gadget/configs/config

Defined on file *configfs-usb-gadget*

The attributes of a configuration:

bmAttributes	configuration characteristics
MaxPower	maximum power consumption from the bus

---

**/config/usb-gadget/gadget/configs/config/strings**

Defined on file *configfs-usb-gadget*

This group contains subdirectories for language-specific strings for this configuration.

---

**/config/usb-gadget/gadget/configs/config/strings/language**

Defined on file *configfs-usb-gadget*

The attributes:

configuration	configuration description
---------------	---------------------------

---

**/config/usb-gadget/gadget/functions**

Defined on file *configfs-usb-gadget*

This group contains functions available to this USB gadget.

---

**/config/usb-gadget/gadget/functions/<func>.<inst>/interface.<n>**

Defined on file *configfs-usb-gadget*

This group contains “Feature Descriptors” specific for one gadget’ s USB interface or one interface group described by an IAD.

The attributes:

compatible_id	8-byte string for “Compatible ID”
sub_compatible_id	8-byte string for “Sub Compatible ID”

---

**/config/usb-gadget/gadget/functions/<func>.<inst>/interface.<n>/<property>**

Defined on file *configfs-usb-gadget*

This group contains “Extended Property Descriptors” specific for one gadget’ s USB interface or one interface group described by an IAD.

The attributes:

type	value 1..7 for interpreting the data <ul style="list-style-type: none"><li>• 1: unicode string</li><li>• 2: unicode string with environment variable</li><li>• 3: binary</li><li>• 4: little-endian 32-bit</li><li>• 5: big-endian 32-bit</li><li>• 6: unicode string with a symbolic link</li><li>• 7: multiple unicode strings</li></ul>
data	blob of data to be interpreted depending on type

---

### /config/usb-gadget/gadget/functions/Loopback.name

---

Defined on file *configfs-usb-gadget-loopback*

The attributes:

qlen	depth of loopback queue
buflen	buffer length

---

### /config/usb-gadget/gadget/functions/SourceSink.name

---

Defined on file *configfs-usb-gadget-sourcesink*

The attributes:

pattern	0 (all zeros), 1 (mod63), 2 (none)
isoc_interval	1..16
isoc_maxpacket	0 - 1023 (fs), 0 - 1024 (hs/ss)
isoc_mult	0..2 (hs/ss only)
isoc_maxburst	0..15 (ss only)
buflen	buffer length
bulk_qlen	depth of queue for bulk
iso_qlen	depth of queue for iso

---

### /config/usb-gadget/gadget/functions/acm.name

---

Defined on file *configfs-usb-gadget-acm*

This item contains just one readonly attribute: `port_num`. It contains the port number of the `/dev/ttyGS<n>` device associated with acm function's instance "name".

---

**/config/usb-gadget/gadget/functions/ecm.name**

---

Defined on file *configfs-usb-gadget-ecl*

The attributes:

**ifname**

- network device interface name associated with this function instance

**qmult**

- queue length multiplier for high and super speed

**host\_addr**

- MAC address of host' s end of this Ethernet over USB link

**dev\_addr**

- MAC address of device' s end of this Ethernet over USB link

---

**/config/usb-gadget/gadget/functions/eem.name**

---

Defined on file *configfs-usb-gadget-eem*

The attributes:

ifname	network device interface name associated with this function instance
qmult	queue length multiplier for high and super speed
host_addr	MAC address of host' s end of this Ethernet over USB link
dev_addr	MAC address of device' s end of this Ethernet over USB link

---

---

**/config/usb-gadget/gadget/functions/ffs.name**

---

Defined on file *configfs-usb-gadget-ffs*

The purpose of this directory is to create and remove it.

A corresponding USB function instance is created/removed. There are no attributes here.

All parameters are set through FunctionFS.

---

**/config/usb-gadget/gadget/functions/geth.name**

---

Defined on file *configfs-usb-gadget-subset*

The attributes:

ifname	network device interface name associated with this function instance
qmult	queue length multiplier for high and super speed
host_addr	MAC address of host's end of this Ethernet over USB link
dev_addr	MAC address of device's end of this Ethernet over USB link

---

### **/config/usb-gadget/gadget/functions/gser.name**

Defined on file *configs-usb-gadget-serial*

This item contains just one readonly attribute: `port_num`. It contains the port number of the `/dev/ttysGS<n>` device associated with `gser` function's instance "name".

### **/config/usb-gadget/gadget/functions/hid.name**

Defined on file *configs-usb-gadget-hid*

The attributes:

protocol	HID protocol to use
re-	blob corresponding to HID report descriptors except the data
port_desc	passed through <code>/dev/hidg&lt;N&gt;</code>
re-	HID report length
port_length	
subclass	HID device subclass to use

---

### **/config/usb-gadget/gadget/functions/mass\_storage.name**

Defined on file *configs-usb-gadget-mass-storage*

The attributes:

stall	Set to permit function to halt bulk endpoints. Disabled on some USB devices known not to work correctly. You should set it to true.
num_bu	Number of pipeline buffers. Valid numbers are 2..4. Available only if <code>CONFIG_USB_GADGET_DEBUG_FILES</code> is set.

---

### **/config/usb-gadget/gadget/functions/mass\_storage.name/lun.name**

Defined on file *configs-usb-gadget-mass-storage*

The attributes:

file	The path to the backing file for the LUN. Required if LUN is not marked as removable.
ro	Flag specifying access to the LUN shall be read-only. This is implied if CD-ROM emulation is enabled as well as when it was impossible to open “filename” in R/W mode.
re-movable	Flag specifying that LUN shall be indicated as being removable.
cdrom	Flag specifying that LUN shall be reported as being a CD-ROM.
no-fua	Flag specifying that FUA flag in SCSI WRITE(10,12)

**/config/usb-gadget/gadget/functions/midi.name**

Defined on file *configs-usb-gadget-midi*

The attributes:

index	index value for the USB MIDI adapter
id	ID string for the USB MIDI adapter
buflen	MIDI buffer length
qlen	USB read request queue length
in_ports	number of MIDI input ports
out_ports	number of MIDI output ports

**/config/usb-gadget/gadget/functions/ncm.name**

Defined on file *configs-usb-gadget-ncm*

The attributes:

**ifname - network device interface name associated with this function instance**

**qmult - queue length multiplier for high and super speed**

**host\_addr - MAC address of host' s end of this**  
Ethernet over USB link

**dev\_addr - MAC address of device' s end of this**  
Ethernet over USB link

**/config/usb-gadget/gadget/functions/obex.name**

Defined on file *configs-usb-gadget-obex*

This item contains just one readonly attribute: `port_num`. It contains the port number of the `/dev/ttyGS<n>` device associated with obex function' s instance “name” .

### **/config/usb-gadget/gadget/functions/phonet.name**

Defined on file *configfs-usb-gadget-phonet*

This item contains just one readonly attribute: `ifname`. It contains the network interface name assigned during network device registration.

### **/config/usb-gadget/gadget/functions/printer.name**

Defined on file *configfs-usb-gadget-printer*

The attributes:

<code>pnp_string</code>	Data to be passed to the host in pnp string
<code>q_len</code>	Number of requests per endpoint

### **/config/usb-gadget/gadget/functions/rndis.name**

Defined on file *configfs-usb-gadget-rndis*

The attributes:

<code>ifname</code>	network device interface name associated with this function instance
<code>qmult</code>	queue length multiplier for high and super speed
<code>host_addr</code>	MAC address of host' s end of this Ethernet over USB link
<code>dev_addr</code>	MAC address of device' s end of this Ethernet over USB link
<code>class</code>	USB interface class, default is 02 (hex)
<code>subclass</code>	USB interface subclass, default is 06 (hex)
<code>protocol</code>	USB interface protocol, default is 00 (hex)

### **/config/usb-gadget/gadget/functions/tcm.name**

Defined on file *configfs-usb-gadget-tcm*

There are no attributes because all the configuration is performed in the “target” subsystem of configfs.

### **/config/usb-gadget/gadget/functions/uac1.name**

Defined on file *configfs-usb-gadget-uac1*

The attributes:

c_chmask	capture channel mask
c_srate	capture sampling rate
c_sszie	capture sample size (bytes)
p_chmask	playback channel mask
p_srate	playback sampling rate
p_sszie	playback sample size (bytes)
req_number	the number of pre-allocated request for both capture and playback

**/config/usb-gadget/gadget/functions/uac1\_legacy.name**

Defined on file *configfs-usb-gadget-uac1\_legacy*

The attributes:

audio\_buf\_size - audio buffer size fn\_cap - capture pcm device file name fn\_ctrl - control device file name fn\_play - playback pcm device file name req\_buf\_size - ISO OUT endpoint request buffer size req\_count - ISO OUT endpoint request count

**/config/usb-gadget/gadget/functions/uac2.name**

Defined on file *configfs-usb-gadget-uac2*

The attributes:

c_chmask	capture channel mask
c_srate	capture sampling rate
c_sszie	capture sample size (bytes)
p_chmask	playback channel mask
p_srate	playback sampling rate
p_sszie	playback sample size (bytes)

**/config/usb-gadget/gadget/functions/uvc.name**

Defined on file *configfs-usb-gadget-uvc*

UVC function directory

streaming_maxburst	0..15 (ss only)
streaming_maxpacket	1..1023 (fs), 1..3072 (hs/ss)
streaming_interval	1..16

**/config/usb-gadget/gadget/functions/uvc.name/control**

Defined on file *configfs-usb-gadget-uvc*

Control descriptors

All attributes read only:

bInterfaceNumber USB interface number for this streaming interface

---

### /config/usb-gadget/gadget/functions/uvc.name/control/class

---

Defined on file *configfs-usb-gadget-uvc*

Class descriptors

---

### /config/usb-gadget/gadget/functions/uvc.name/control/class/fs

---

Defined on file *configfs-usb-gadget-uvc*

Full speed control class descriptors

---

### /config/usb-gadget/gadget/functions/uvc.name/control/class/ss

---

Defined on file *configfs-usb-gadget-uvc*

Super speed control class descriptors

---

### /config/usb-gadget/gadget/functions/uvc.name/control/header

---

Defined on file *configfs-usb-gadget-uvc*

Control header descriptors

---

### /config/usb-gadget/gadget/functions/uvc.name/control/header/name

---

Defined on file *configfs-usb-gadget-uvc*

Specific control header descriptors

dwClockFrequency bcdUVC

---

### /config/usb-gadget/gadget/functions/uvc.name/control/processing

---

Defined on file *configfs-usb-gadget-uvc*

Processing unit descriptors

---

### /config/usb-gadget/gadget/functions/uvc.name/control/processing/default

---

Defined on file *configfs-usb-gadget-uvc*

Default processing unit descriptors

All attributes read only:

iProcessing	index of string descriptor
bmControls	bitmap specifying which controls are supported for the video stream
wMaxMultiplier	maximum digital magnification x100
bSourceID	id of the terminal to which this unit is connected
bUnitID	a non-zero id of this unit

### **/config/usb-gadget/gadget/functions/uvc.name/control/terminal**

Defined on file *configfs-usb-gadget-uvc*

Terminal descriptors

### **/config/usb-gadget/gadget/functions/uvc.name/control/terminal/camera**

Defined on file *configfs-usb-gadget-uvc*

Camera terminal descriptors

### **/config/usb-gadget/gadget/functions/uvc.name/control/terminal/camera/default**

Defined on file *configfs-usb-gadget-uvc*

Default camera terminal descriptors

All attributes read only:

bmControls	bitmap specifying which controls are supported for the video stream
wOcularFocalLength	the value of Locular
wObjectiveFocal- LengthMax	the value of Lmin
wObjectiveFocal- LengthMin	the value of Lmax
iTerminal	index of string descriptor
bAssocTerminal	id of the output terminal to which this terminal is connected
wTerminalType	terminal type
bTerminalID	a non-zero id of this terminal

### **/config/usb-gadget/gadget/functions/uvc.name/control/terminal/output**

Defined on file *configfs-usb-gadget-uvc*

Output terminal descriptors

### /config/usb-gadget/gadget/functions/uvc.name/control/terminal/output/default

---

Defined on file *configfs-usb-gadget-uvc*

Default output terminal descriptors

All attributes read only except bSourceID:

iTerminal	index of string descriptor
bSourceID	id of the terminal to which this terminal is connected
bAssocTerminal	id of the input terminal to which this output terminal is associated
wTerminal-Type	terminal type
bTerminalID	a non-zero id of this terminal

---

### /config/usb-gadget/gadget/functions/uvc.name/streaming

---

Defined on file *configfs-usb-gadget-uvc*

Streaming descriptors

All attributes read only:

bInterfaceNumber	USB interface number for this streaming interface
------------------	---

---

### /config/usb-gadget/gadget/functions/uvc.name/streaming/class

---

Defined on file *configfs-usb-gadget-uvc*

Streaming class descriptors

### /config/usb-gadget/gadget/functions/uvc.name/streaming/class/fs

---

Defined on file *configfs-usb-gadget-uvc*

Full speed streaming class descriptors

### /config/usb-gadget/gadget/functions/uvc.name/streaming/class/hs

---

Defined on file *configfs-usb-gadget-uvc*

High speed streaming class descriptors

### /config/usb-gadget/gadget/functions/uvc.name/streaming/class/ss

---

Defined on file *configfs-usb-gadget-uvc*

Super speed streaming class descriptors

---

### **/config/usb-gadget/gadget/functions/uvc.name/streaming/color\_matching**

---

Defined on file *configfs-usb-gadget-uvc*

Color matching descriptors

---

### **/config/usb-gadget/gadget/functions/uvc.name/streaming/color\_matching/default**

---

Defined on file *configfs-usb-gadget-uvc*

Default color matching descriptors

All attributes read only:

bMatrixCoefficients	matrix used to compute luma and chroma values from the color primaries
bTransferCharacteristics	optoelectronic transfer characteristic of the source picture, also called the gamma function
bColorPrimaries	color primaries and the reference white

---

---

### **/config/usb-gadget/gadget/functions/uvc.name/streaming/header**

---

Defined on file *configfs-usb-gadget-uvc*

Streaming header descriptors

---

### **/config/usb-gadget/gadget/functions/uvc.name/streaming/header/name**

---

Defined on file *configfs-usb-gadget-uvc*

Specific streaming header descriptors

All attributes read only:

bTriggerUsage	how the host software will respond to a hardware trigger interrupt event
bTriggerSupport	flag specifying if hardware triggering is supported
bStillCaptureMethod	method of still image capture supported
bTerminalLink	id of the output terminal to which the video endpoint of this interface is connected
bmInfo	capabilities of this video streaming interface

---

---

**/config/usb-gadget/gadget/functions/uvc.name/streaming/mjpeg**

---

Defined on file *configfs-usb-gadget-uvc*

MJPEG format descriptors

---

**/config/usb-gadget/gadget/functions/uvc.name/streaming/mjpeg/name**

---

Defined on file *configfs-usb-gadget-uvc*

Specific MJPEG format descriptors

All attributes read only, except bmaControls and bDefaultFrameIndex:

bFormatIndex	unique id for this format descriptor; only defined after parent header is linked into the streaming class; read-only
bmaControls	this format's data for bmaControls in the streaming header
bmInterfaceFlags	specifies interlace information, read-only
bAspectRatioY	the X dimension of the picture aspect ratio, read-only
bAspectRatioX	the Y dimension of the picture aspect ratio, read-only
bmFlags	characteristics of this format, read-only
bDefaultFrameIndex	optimum frame index for this stream

---

---

**/config/usb-gadget/gadget/functions/uvc.name/streaming/mjpeg/name/name**

---

Defined on file *configfs-usb-gadget-uvc*

Specific MJPEG frame descriptors

bFrameIndex	unique id for this framedescriptor; only defined after parent format is linked into the streaming header; read-only
dwFrameInterval	indicates how frame interval can be programmed; a number of values separated by newline can be specified
dwDefaultFrameInterval	the frame interval the device would like to use as default
dwMaxVideoFrameBufferSize	the maximum number of bytes the compressor will produce for a video frame or still image
dwMaxBitRate	the maximum bit rate at the shortest frame interval in bps
dwMinBitRate	the minimum bit rate at the longest frame interval in bps
wHeight	height of decoded bitmap frame in px
wWidth	width of decoded bitmap frame in px
bmCapabilities	still image support, fixed frame-rate support

**/config/usb-gadget/gadget/functions/uvc.name/streaming/uncompressed**Defined on file *configfs-usb-gadget-uvc*

Uncompressed format descriptors

**/config/usb-gadget/gadget/functions/uvc.name/streaming/uncompressed/name**Defined on file *configfs-usb-gadget-uvc*

Specific uncompressed format descriptors

bFormatIndex	unique id for this format descriptor; only defined after parent header is linked into the streaming class; read-only
bmaControls	this format' s data for bmaControls in the streaming header
bmInterlaceFlags	specifies interlace information, read-only
bAspectRatioY	the X dimension of the picture aspect ratio, read-only
bAspectRatioX	the Y dimension of the picture aspect ratio, read-only
bDefaultFrameIndex	optimum frame index for this stream
bBitsPerPixel	number of bits per pixel used to specify color in the decoded video frame
guidFormat	globally unique id used to identify stream-encoding format

**/config/usb-gadget/gadget/functions/uvc.name/streaming/uncompressed/name/name**Defined on file *configfs-usb-gadget-uvc*

Specific uncompressed frame descriptors

bFrameIndex	unique id for this framedescriptor; only defined after parent format is linked into the streaming header; read-only
dwFrameInterval	indicates how frame interval can be programmed; a number of values separated by newline can be specified
dwDefaultFrameInterval	the frame interval the device would like to use as default
dwMaxVideoFrameBufferSize	the maximum number of bytes the compressor will produce for a video frame or still image
dwMaxBitRate	the maximum bit rate at the shortest frame interval in bps
dwMinBitRate	the minimum bit rate at the longest frame interval in bps
wHeight	height of decoded bitmap frame in px
wWidth	width of decoded bitmap frame in px
bmCapabilities	still image support, fixed frame-rate support

---

**/config/usb-gadget/gadget/os\_desc**

---

Defined on file *configfs-usb-gadget*

This group contains “OS String” extension handling attributes.

use	flag turning “OS Descriptors” support on/off
b_vendor_code	one-byte value used for custom per-device and per-interface requests
qw_sign	an identifier to be reported as “OS String” proper

---

**/config/usb-gadget/gadget/strings**

---

Defined on file *configfs-usb-gadget*

This group contains subdirectories for language-specific strings for this gadget.

---

**/config/usb-gadget/gadget/strings/language**

---

Defined on file *configfs-usb-gadget*

The attributes:

serialnumber	gadget’ s serial number (string)
product	gadget’ s product description
manufacturer	gadget’ s manufacturer description

### 5.2.7 Symbols under /dev/gpiochip

#### /dev/gpiochip[0-9]+

Defined on file *gpio-cdev*

The character device files /dev/gpiochip\* are the interface between GPIO chips and userspace.

The ioctl(2)-based ABI is defined and documented in [include/uapi]<linux/gpio.h>.

The following file operations are supported:

#### **open(2)**

Currently the only useful flags are O\_RDWR.

#### **ioctl(2)**

Initiate various actions.

See the inline documentation in [include/uapi]<linux/gpio.h> for descriptions of all ioctls.

#### **close(2)**

Stops and free up the I/O contexts that was associated with the file descriptor.

Users: TBD

### 5.2.8 Symbols under /dev/kmsg

#### /dev/kmsg

Defined on file *dev-kmsg*

The /dev/kmsg character device node provides userspace access to the kernel's printk buffer.

Injecting messages:

Every write() to the opened device node places a log entry in the kernel's printk buffer.

The logged line can be prefixed with a <N> syslog prefix, which carries the syslog priority and facility. The single decimal prefix number is composed of the 3 lowest bits being the syslog priority and the next 8 bits the syslog facility number.

If no prefix is given, the priority number is the default kernel log priority and the facility number is set to LOG\_USER (1). It is not possible to inject messages from userspace with the facility number LOG\_KERN (0), to make sure that the origin of the messages can always be reliably determined.

Accessing the buffer:

Every read() from the opened device node receives one record of the kernel's printk buffer.

The first read() directly following an open() always returns first message in the buffer; there is no kernel-internal persistent state; many readers can concurrently open the device and read from it, without affecting other readers.

Every read() will receive the next available record. If no more records are available read() will block, or if O\_NONBLOCK is used -EAGAIN returned.

Messages in the record ring buffer get overwritten as whole, there are never partial messages received by read().

In case messages get overwritten in the circular buffer while the device is kept open, the next read() will return -EPIPE, and the seek position be updated to the next available record. Subsequent reads() will return available records again.

Unlike the classic syslog() interface, the 64 bit record sequence numbers allow to calculate the amount of lost messages, in case the buffer gets overwritten. And they allow to reconnect to the buffer and reconstruct the read position if needed, without limiting the interface to a single reader.

The device supports seek with the following parameters:

### **SEEK\_SET, 0**

seek to the first entry in the buffer

### **SEEK\_END, 0**

seek after the last entry in the buffer

### **SEEK\_DATA, 0**

seek after the last record available at the time the last SYSLOG\_ACTION\_CLEAR was issued.

Other seek operations or offsets are not supported because of the special behavior this device has. The device allows to read or write only whole variable length messages (records) that are stored in a ring buffer.

Because of the non-standard behavior also the error values are non-standard. -ESPIPE is returned for non-zero offset. -EINVAL is returned for other operations, e.g. SEEK\_CUR. This behavior and values are historical and could not be modified without the risk of breaking userspace.

The output format consists of a prefix carrying the syslog prefix including priority and facility, the 64 bit message sequence number and the monotonic timestamp in microseconds, and a flag field. All fields are separated by a ‘;’ .

Future extensions might add more comma separated values before the terminating ‘;’ . Unknown fields and values should be gracefully ignored.

The human readable text string starts directly after the ‘;’ and is terminated by a ‘n’ . Untrusted values derived from hardware or other facilities are printed, therefore all non-printable characters and “ itself in the log message are escaped by “x00” C-style hex encoding.

A line starting with ‘ ‘, is a continuation line, adding key/value pairs to the log message, which provide the machine readable context of the message, for reliable processing in userspace.

Example:

```
7,160,424069,-;pci_root PNP0A03:00: host bridge window [io 0x0000-
↳ 0x0cf7] (ignored)
SUBSYSTEM=acpi
DEVICE=+acpi:PNP0A03:00
6,339,5140900,-;NET: Registered protocol family 10
30,340,5690716,-;udevd[80]: starting version 181
```

The DEVICE= key uniquely identifies devices the following way:

b12:8	block dev_t
c127:3	char dev_t
n8	netdev ifindex
+sound:card0	subsystem:devname

The flags field carries ‘-’ by default. A ‘c’ indicates a fragment of a line. Note, that these hints about continuation lines are not necessarily correct, and the stream could be interleaved with unrelated messages, but merging the lines in the output usually produces better human readable results. A similar logic is used internally when messages are printed to the console, /proc/kmsg or the syslog() syscall.

By default, kernel tries to avoid fragments by concatenating when it can and fragments are rare; however, when extended console support is enabled, the in-kernel concatenation is disabled and /dev/kmsg output will contain more fragments. If the log consumer performs concatenation, the end result should be the same. In the future, the in-kernel concatenation may be removed entirely and /dev/kmsg users are recommended to implement fragment handling.

Users: dmesg(1), userspace kernel log consumers

### 5.2.9 Symbols under /dev/rtcX

#### /dev/rtcX

Defined on file [rtc-cdev](#)

The ioctl interface to drivers for real-time clocks (RTCs). Following actions are supported:

- RTC\_RD\_TIME, RTC\_SET\_TIME: Read or set the RTC time. Time format is a Gregorian calendar date and 24 hour wall clock time.
- RTC\_AIE\_ON, RTC\_AIE\_OFF: Enable or disable the alarm interrupt for RTCs that support alarms
- RTC\_ALM\_READ, RTC\_ALM\_SET: Read or set the alarm time for RTCs that support alarms. Can be set upto 24 hours in the future. Requires a separate RTC\_AIE\_ON call to enable the alarm interrupt. (Prefer to use RTC\_WKALM\_\*)

- RTC\_WKALM\_RD, RTC\_WKALM\_SET: For RTCs that support a more powerful interface, which can issue alarms beyond 24 hours and enable IRQs in the same request.
- RTC\_PIE\_ON, RTC\_PIE\_OFF: Enable or disable the periodic interrupt for RTCs that support periodic interrupts.
- RTC\_UIE\_ON, RTC\_UIE\_OFF: Enable or disable the update interrupt for RTCs that support it.
- RTC\_IRQP\_READ, RTC\_IRQP\_SET: Read or set the frequency for periodic interrupts for RTCs that support periodic interrupts. Requires a separate RTC\_PIE\_ON call to enable the periodic interrupts.
- RTC\_VL\_READ: Read the voltage inputs status of the RTC when supported. The value is a bit field of RTC\_VL\_\*, giving the status of the main and backup voltages.
- RTC\_VL\_CLEAR: Clear the voltage status of the RTC. Some RTCs need user interaction when the backup power provider is replaced or charged to be able to clear the status.

The ioctl() calls supported by the older /dev/rtc interface are also supported by the newer RTC class framework. However, because the chips and systems are not standardized, some PC/AT functionality might not be provided. And in the same way, some newer features - including those enabled by ACPI - are exposed by the RTC class framework, but can't be supported by the older driver.

### 5.2.10 Symbols under /dev/wmi

---

#### /dev/wmi/dell-smbios

---

Defined on file *dell-smbios-wmi*

Perform SMBIOS calls on supported Dell machines. through the Dell ACPI-WMI interface.

IOCTL's and buffer formats are defined in: <uapi/linux/wmi.h>

- 1) To perform an SMBIOS call from userspace, you'll need to first determine the minimum size of the calling interface buffer for your machine. Platforms that contain larger buffers can return larger objects from the system firmware. Commonly this size is either 4k or 32k.

To determine the size of the buffer read() a u64 dword from the WMI character device /dev/wmi/dell-smbios.

- 2) After you've determined the minimum size of the calling interface buffer, you can allocate a structure that represents the structure documented above.
- 3) In the 'length' object store the size of the buffer you determined above and allocated.
- 4) In this buffer object, prepare as necessary for the SMBIOS call you're interested in. Typically SMBIOS buffers have "class", "select", and "input" defined to values that coincide with the data you are interested in. Documenting

class/select/input values is outside of the scope of this documentation. Check with the libsmbios project for further documentation on these values.

- 6) Run the call by using ioctl() as described in the header.
- 7) The output will be returned in the buffer object.
- 8) Be sure to free up your allocated object.

### **5.2.11 Symbols under /kvd**

---

---

**/kvd/**

Defined on file *devlink-resource-mlxsw*

The main database in the Spectrum device is a centralized KVD database used for many of the tables used to configure the chip including L2 FDB, L3 LPM, ECMP and more. The KVD is divided into two sections, the first is hash-based table and the second is a linear access table. The division between the linear and hash-based sections is static and require reload before the changes take effect.

### **5.2.12 Symbols under /kvd/hash\_double**

---

---

**/kvd/hash\_double**

Defined on file *devlink-resource-mlxsw*

The hash based section of the KVD is managed by the switch device. Used in case the key is larger than 64 bit.

### **5.2.13 Symbols under /kvd/hash\_single**

---

---

**/kvd/hash\_single**

Defined on file *devlink-resource-mlxsw*

The hash based section of the KVD is managed by the switch device. Used in case the key size is smaller or equal to 64bit.

### 5.2.14 Symbols under /kvd/linear

#### /kvd/linear

Defined on file *devlink-resource-mlxsw*

The linear section of the KVD is managed by software as a flat memory accessed using an index.

### 5.2.15 Symbols under /proc/diskstats

#### /proc/diskstats

Defined on file *procfs-diskstats*

The /proc/diskstats file displays the I/O statistics of block devices. Each line contains the following 14 fields:

1	major number
2	minor number
3	device name
4	reads completed successfully
5	reads merged
6	sectors read
7	time spent reading (ms)
8	writes completed
9	writes merged
10	sectors written
11	time spent writing (ms)
12	I/Os currently in progress
13	time spent doing I/Os (ms)
14	weighted time spent doing I/Os (ms)

Kernel 4.18+ appends four more fields for discard tracking putting the total at 18:

15	discards completed successfully
16	discards merged
17	sectors discarded
18	time spent discarding

Kernel 5.5+ appends two more fields for flush requests:

19	flush requests completed successfully
20	time spent flushing

For more details refer to *I/O statistics fields*

### 5.2.16 Symbols under /proc/pid

#### /proc/pid/smaps\_rollup

Defined on file *procfs-smaps\_rollup*

This file provides pre-summed memory information for a process. The format is almost identical to /proc/pid/smaps, except instead of an entry for each VMA in a process, smaps\_rollup has a single entry (tagged “[rollup]”) for which each field is the sum of the corresponding fields from all the maps in /proc/pid/smaps. Additionally, the fields Pss\_Anon, Pss\_File and Pss\_Shmem are not present in /proc/pid/smaps. These fields represent the sum of the Pss field of each type (anon, file, shmem). For more details, see /filesystems/proc and the procfs man page.

Typical output looks like this:

```
00100000-ff709000 ---p 00000000 00:00 0 [rollup]
Size:           1192 kB
KernelPageSize:   4 kB
MMUPageSize:     4 kB
Rss:            884 kB
Pss:            385 kB
Pss_Anon:        301 kB
Pss_File:        80 kB
Pss_Shmem:       4 kB
Shared_Clean:    696 kB
Shared_Dirty:    0 kB
Private_Clean:   120 kB
Private_Dirty:   68 kB
Referenced:      884 kB
Anonymous:       68 kB
LazyFree:        0 kB
AnonHugePages:   0 kB
ShmemPmdMapped: 0 kB
Shared_Hugetlb:  0 kB
Private_Hugetlb: 0 kB
Swap:            0 kB
SwapPss:         0 kB
Locked:          385 kB
```

### 5.2.17 Symbols under /sys

#### /sys/…/<device>/<UUID>/

Defined on file *sysfs-bus-vfio-mddev*

This directory represents device directory of mediated device. It contains all the attributes related to mediated device.

### /sys/…/<device>/<UUID>/mdev\_type

Defined on file *sysfs-bus-vfio-mdev*

This is symbolic link pointing to supported type, <type-id> directory of which this mediated device is created.

### /sys/…/<device>/<UUID>/remove

Defined on file *sysfs-bus-vfio-mdev*

Writing ‘1’ to this file destroys the mediated device. The vendor driver can fail the remove() callback if that device is active and the vendor driver doesn’t support hot unplug. Example:

```
# echo 1 > /sys/bus/mdev/devices/<UUID>/remove
```

### /sys/…/<device>/mdev\_supported\_types/

Defined on file *sysfs-bus-vfio-mdev*

This directory contains list of directories of currently supported mediated device types and their details for <device>. Supported type attributes are defined by the vendor driver who registers with Mediated device framework. Each supported type is a directory whose name is created by adding the device driver string as a prefix to the string provided by the vendor driver.

### /sys/…/<device>/mdev\_supported\_types/<type-id>/

Defined on file *sysfs-bus-vfio-mdev*

This directory gives details of supported type, like name, description, available\_instances, device\_api etc. ‘device\_api’ and ‘available\_instances’ are mandatory attributes to be provided by vendor driver. ‘name’, ‘description’ and other vendor driver specific attributes are optional.

### /sys/…/events/illuminance\_threshY\_falling\_value /sys/…/events/illuminance\_threshY\_raising\_value

Defined on file *sysfs-bus-iio-light-lm3533-als*

Specifies the value of threshold that the device is comparing against for the events enabled by in\_illuminance0\_thresh\_either\_en (0..255), where Y in 0..3.

Note that threshY\_falling must be less than or equal to threshY\_raising.

These thresholds correspond to the eight zone-boundary registers (boundaryY\_{low,high}) and define the five light zones.

---

<code>/sys/…/events/in_accel_raw_mag_value</code>
<code>/sys/…/events/in_accel_x_raw_mag_rising_value</code>
<code>/sys/…/events/in_accel_y_raw_mag_rising_value</code>
<code>/sys/…/events/in_accel_z_raw_mag_rising_value</code>

---

Defined on file [sysfs-bus-iio](#)

The value to which the magnitude of the channel is compared. If number or direction is not specified, applies to all channels of this type.

---

<code>/sys/…/events/in_accel_scale</code>
<code>/sys/…/events/in_accel_peak_scale</code>
<code>/sys/…/events/in_anglvel_scale</code>

/sys/…/events/in_illuminance0_thresh_rising_value
/sys/…/events/in_proximity0_thresh_falling_value
/sys/…/events/in_proximity0_thresh_rising_value
/sys/…/events/in_illuminance_thresh_rising_value
/sys/…/events/in_illuminance_thresh_falling_value

---

Defined on file [sysfs-bus-iio](#)

Specifies the value of threshold that the device is comparing against for the events enabled by <type>Y[\_name]\_thresh[\_rising|falling]\_en.

If separate attributes exist for the two directions, but direction is not specified for this attribute, then a single threshold value applies to both directions.

The raw or input element of the name indicates whether the value is in raw device units or in processed units (as \_raw and \_input do on sysfs direct channel read attributes).

/sys/…/events/in_tempY_thresh_either_hysteresis
/sys/…/events/in_illuminance0_thresh_falling_hysteresis
/sys/…/events/in_illuminance0_thresh_rising_hysteresis
/sys/…/events/in_illuminance0_thresh_either_hysteresis
/sys/…/events/in_proximity0_thresh_falling_hysteresis
/sys/…/events/in_proximity0_thresh_rising_hysteresis
/sys/…/events/in_proximity0_thresh_either_hysteresis

Defined on file [sysfs-bus-iio](#)

Specifies the hysteresis of threshold that the device is comparing against for the events enabled by <type>Y[\_name]\_thresh[\_(rising|falling)]\_hysteresis. If sepa-

rate attributes exist for the two directions, but direction is not specified for this attribute, then a single hysteresis value applies to both directions.

For falling events the hysteresis is added to the \_value attribute for this event to get the upper threshold for when the event goes back to normal, for rising events the hysteresis is subtracted from the \_value attribute. E.g. if in\_voltage0\_raw\_thresh\_rising\_value is set to 1200 and in\_voltage0\_raw\_thresh\_rising\_hysteresis is set to 50. The event will get activated once in\_voltage0\_raw goes above 1200 and will become deactivated again once the value falls below 1150.

```

/sys/…/events/in_activity_running_thresh_rising_period
/sys/…/events/in_activity_running_thresh_falling_period
/sys/…/events/in_illuminance_thresh_either_period

---

Defined on file [sysfs-bus-iio](#)

Period of time (in seconds) for which the condition must be met before an event is generated. If direction is not specified then this period applies to both directions.

---

```
/sys/…/events/in_activity_still_thresh_rising_en
/sys/…/events/in_activity_still_thresh_falling_en
/sys/…/events/in_activity_walking_thresh_rising_en
/sys/…/events/in_activity_walking_thresh_falling_en
/sys/…/events/in_activity_jogging_thresh_rising_en
/sys/…/events/in_activity_jogging_thresh_falling_en
/sys/…/events/in_activity_running_thresh_rising_en
/sys/…/events/in_activity_running_thresh_falling_en
```

---

Defined on file [sysfs-bus-iio](#)

Enables or disables activity events. Depending on direction an event is generated when sensor ENTERS or LEAVES a given state.

---

```
/sys/…/events/in_activity_still_thresh_rising_value
/sys/…/events/in_activity_still_thresh_falling_value
/sys/…/events/in_activity_walking_thresh_rising_value
/sys/…/events/in_activity_walking_thresh_falling_value
/sys/…/events/in_activity_jogging_thresh_rising_value
/sys/…/events/in_activity_jogging_thresh_falling_value
/sys/…/events/in_activity_running_thresh_rising_value
/sys/…/events/in_activity_running_thresh_falling_value
```

---

Defined on file [sysfs-bus-iio](#)

Confidence value (in units as percentage) to be used for deciding when an event should be generated. E.g for running: If the confidence value reported by the sensor is greater than `in_activity_running_thresh_rising_value` then the sensor ENTERS running state. Conversely, if the confidence value reported by the sensor is lower than `in_activity_running_thresh_falling_value` then the sensor is LEAVING running state.

---

```
/sys/…/events/in_illuminance0_threshY_hysteresis
```

---

Defined on file [sysfs-bus-iio-light-lm3533-als](#)

Get the hysteresis for thresholds Y, that is, `threshY_hysteresis = threshY_raising - threshY_falling`

---

```
/sys/…/events/in_illuminance0_thresh_either_en
```

---

Defined on file [sysfs-bus-iio-light-lm3533-als](#)

Event generated when channel passes one of the four thresholds in each direction (rising|falling) and a zone change occurs. The corresponding light zone can be read from `in_illuminance0_zone`.

---

```
/sys/…/events/in_steps_change_en
```

---

Defined on file [sysfs-bus-iio](#)

Event generated when channel passes a threshold on the absolute change in value. E.g. for steps: a step change event is generated each time the user takes N steps, where N is set using in\_steps\_change\_value.

**/sys/…/events/in\_steps\_change\_value**

---

Defined on file [sysfs-bus-iio](#)

Specifies the value of change threshold that the device is comparing against for the events enabled by <type>[Y][\_name]\_roc[\_rising|falling|]\_en. E.g. for steps: if set to 3, a step change event will be generated every 3 steps.

**/sys/…/iio:deviceX/events/in\_accel\_mag\_en

/sys/…/iio:deviceX/events/in_tempY_rock_falling_en
```

---

Defined on file [sysfs-bus-iio](#)

Event generated when channel passes a threshold on the rate of change (1st differential) in the specified (\_rising|\_falling) direction. If the direction is not specified, then either the device will report an event which ever direction a single threshold value is passed in (e.g. <type>[Y][\_name]\_<raw|input>\_roc\_value) or <type>[Y][\_name]\_<raw|input>\_roc\_rising\_value and <type>[Y][\_name]\_<raw|input>\_roc\_falling\_value may take different values, but the device can only enable both rate of change thresholds or neither.

Note the driver will assume the last p events requested are to be enabled where p is however many it supports (which may vary depending on the exact set requested). So if you want to be sure you have set what you think you have, check the contents of these attributes after everything is configured. Drivers may have to buffer any parameters so that they are consistent when a given event type is enabled a future point (and not those for whatever event was previously enabled).

---

Defined on file [sysfs-bus-iio](#)

Event generated when channel passes a threshold in the specified (\_rising|\_falling) direction. If the direction is not specified, then either the device will report an event which ever direction a single threshold value is passed in (e.g. <type>[Y][\_name]<raw|input>\_thresh\_value) or <type>[Y][\_name]<raw|input>\_thresh\_rising\_value and <type>[Y][\_name]<raw|input>\_thresh\_falling\_value may take different values, but the device can only enable both thresholds or neither.

Note the driver will assume the last p events requested are to be enabled where p is how many it supports (which may vary depending on the exact set requested). So if you want to be sure you have set what you think you have, check the contents of these attributes after everything is configured. Drivers may have to buffer any parameters so that they are consistent when a given event type is enabled at a future point (and not those for whatever event was previously enabled).

---

/sys/…/iio:deviceX/in_accelX_power_mode
---

---

Defined on file [sysfs-bus-iio](#)

Specifies the chip power mode. low\_noise: reduce noise level from ADC, low\_power: enable low current consumption. For a list of available output power modes read in\_accel\_power\_mode\_available.

---

/sys/…/iio:deviceX/in_activity_still_input
/sys/…/iio:deviceX/in_activity_walking_input
/sys/…/iio:deviceX/in_activity_jogging_input
/sys/…/iio:deviceX/in_activity_running_input

---

Defined on file *sysfs-bus-iio*

This attribute is used to read the confidence for an activity expressed in units as percentage.

---

**/sys/…/iio:deviceX/in\_anglev\_z\_quadrature\_correction\_raw**

---

Defined on file *sysfs-bus-iio*

This attribute is used to read the amount of quadrature error present in the device at a given time.

---

**/sys/…/iio:deviceX/in\_capacitanceY-capacitanceZ\_raw**

---

Defined on file *sysfs-bus-iio*

Raw differential capacitance measurement equivalent to channel Y - channel Z where these channel numbers apply to the physically equivalent inputs when non differential readings are separately available. In differential only parts, then all that is required is a consistent labeling. Units after application of scale and offset are nanofarads.

---

**/sys/…/iio:deviceX/in\_distance\_input**  
**/sys/…/iio:deviceX/in\_distance\_raw**

---

Defined on file *sysfs-bus-iio*

This attribute is used to read the measured distance to an object or the distance covered by the user since the last reboot while activated. Units after application of scale are meters.

---

**/sys/…/iio:deviceX/in\_energy\_en**  
**/sys/…/iio:deviceX/in\_distance\_en**  
**/sys/…/iio:deviceX/in\_velocity\_sqrt(x^2+y^2+z^2)\_en**  
**/sys/…/iio:deviceX/in\_steps\_en**

---

Defined on file *sysfs-bus-iio*

Activates a device feature that runs in firmware/hardware. E.g. for steps: the pedometer saves power while not used; when activated, it will count the steps taken by the user in firmware and export them through in\_steps\_input.

---

**/sys/…/iio:deviceX/in\_energy\_input**  
**/sys/…/iio:deviceX/in\_energy\_raw**

---

Defined on file *sysfs-bus-iio*

This attribute is used to read the energy value reported by the device (e.g.: human activity sensors report energy burnt by the user). Units after application of scale are Joules.

```
/sys/…/iio:deviceX/in_illuminance_input
/sys/…/iio:deviceX/in_illuminance_raw
/sys/…/iio:deviceX/in_illuminanceY_input
/sys/…/iio:deviceX/in_illuminanceY_raw
/sys/…/iio:deviceX/in_illuminanceY_mean_raw
/sys/…/iio:deviceX/in_illuminance_ir_raw
/sys/…/iio:deviceX/in_illuminance_clear_raw
```

Defined on file [sysfs-bus-iio](#)

Illuminance measurement, units after application of scale and offset are lux.

```
/sys/…/iio:deviceX/in_intensityY_raw
/sys/…/iio:deviceX/in_intensityY_ir_raw
/sys/…/iio:deviceX/in_intensityY_both_raw
/sys/…/iio:deviceX/in_intensityY_uv_raw
/sys/…/iio:deviceX/in_intensityY_duv_raw
```

Defined on file [sysfs-bus-iio](#)

Unit-less light intensity. Modifiers both and ir indicate that measurements contain visible and infrared light components or just infrared light, respectively. Modifier uv indicates that measurements contain ultraviolet light components. Modifier duv indicates that measurements contain deep ultraviolet light components.

```
/sys/…/iio:deviceX/in_intensity_integration_time
/sys/…/iio:deviceX/in_intensity_red_integration_time
/sys/…/iio:deviceX/in_intensity_green_integration_time
/sys/…/iio:deviceX/in_intensity_blue_integration_time
/sys/…/iio:deviceX/in_intensity_clear_integration_time
/sys/…/iio:deviceX/in_illuminance_integration_time
```

Defined on file [sysfs-bus-iio](#)

This attribute is used to get/set the integration time in seconds. If shared across all channels of a given type, <type>\_integration\_time is used.

```
/sys/…/iio:deviceX/in_proximity_raw
/sys/…/iio:deviceX/in_proximity_input
/sys/…/iio:deviceX/in_proximityY_raw
```

Defined on file [sysfs-bus-iio](#)

Proximity measurement indicating that some object is near the sensor, usually by observing reflectivity of infrared or ultrasound emitted.

Often these sensors are unit less and as such conversion to SI units is not possible. Higher proximity measurements indicate closer objects, and vice versa. Units after application of scale and offset are meters.

**/sys/…/iio:deviceX/in\_steps\_debounce\_count**

Defined on file *sysfs-bus-iio*

Specifies the number of steps that must occur within in\_steps\_filter\_debounce\_time for the pedometer to decide the consumer is making steps.

**/sys/…/iio:deviceX/in\_steps\_debounce\_time**

Defined on file *sysfs-bus-iio*

Specifies number of seconds in which we compute the steps that occur in order to decide if the consumer is making steps.

**/sys/…/iio:deviceX/in\_steps\_input**

Defined on file *sysfs-bus-iio*

This attribute is used to read the number of steps taken by the user since the last reboot while activated.

**/sys/…/iio:deviceX/in\_uvindex\_input**

Defined on file *sysfs-bus-iio*

UV light intensity index measuring the human skin's response to different wavelength of sunlight weighted according to the standardised CIE Erythemal Action Spectrum. UV index values range from 0 (low) to >=11 (extreme).

**/sys/…/iio:deviceX/in\_velocity\_sqrt(x^2+y^2+z^2)\_input**  
**/sys/…/iio:deviceX/in\_velocity\_sqrt(x^2+y^2+z^2)\_raw**

Defined on file *sysfs-bus-iio*

This attribute is used to read the current speed value of the user (which is the norm or magnitude of the velocity vector). Units after application of scale are m/s.

**/sys/…/iio:deviceX/in\_velocity\_sqrt(x^2+y^2+z^2)\_integration\_time**

Defined on file *sysfs-bus-iio*

Number of seconds in which to compute speed.

**/sys/…/iio:deviceX/out\_voltageY\_powerdown\_mode\_available**  
**/sys/…/iio:deviceX/out\_voltage\_powerdown\_mode\_available**  
**/sys/…/iio:deviceX/out\_altvoltageY\_powerdown\_mode\_available**  
**/sys/…/iio:deviceX/out\_altvoltage\_powerdown\_mode\_available**

Defined on file [sysfs-bus-iio](#)

Lists all available output power down modes. If Y is not present the mode is shared across all outputs.

```
/sys/…/iio:deviceX/scan_elements/in_accel_type
/sys/…/iio:deviceX/scan_elements/in_anglvel_type

/sys/…/iio:deviceX/scan_elements/in_pressureY_type
/sys/…/iio:deviceX/scan_elements/in_pressure_type
/sys/…/iio:deviceX/scan_elements/in_rot_quaternion_type
/sys/…/iio:deviceX/scan_elements/in_proximity_type
```

Defined on file [sysfs-bus-iio](#)

Description of the scan element data storage within the buffer and hence the form in which it is read from user-space. Form is [be|le]:[s|u]bits/storagebits[>>shift]. be or le specifies big or little endian. s or u specifies if signed (2' s complement) or unsigned. bits is the number of bits of data and storagebits is the space (after padding) that it occupies in the buffer. shift if specified, is the shift that needs to be applied prior to masking out unused bits. Some devices put their data in the middle of the transferred elements with additional information on both sides. Note that some devices will have additional information in the unused bits so to get a clean value, the bits value must be used to mask the buffer output value appropriately. The storagebits value also specifies the data alignment. So s48/64>>2 will be a signed 48 bit integer stored in a 64 bit location aligned to a 64 bit boundary. To obtain the clean value, shift right 2 and apply a mask to zero the top 16 bits of the result. For other storage combinations this attribute will be extended appropriately.

```
/sys/…/iio:deviceX/scan_elements/in_accel_type_available
```

Defined on file [sysfs-bus-iio](#)

If the type parameter can take one of a small set of values, this attribute lists them.

```
/sys/…/in_accel_filter_high_pass_3db_frequency
/sys/…/in_anglvel_filter_high_pass_3db_frequency
/sys/…/in_magn_filter_high_pass_3db_frequency
```

---

Defined on file [sysfs-bus-iio](#)

If a known or controllable high pass filter is applied to the underlying data channel, then this parameter gives the 3dB frequency of the filter in Hz.

---

```
/sys/…/in_accel_filter_low_pass_3db_frequency
/sys/…/in_magn_filter_low_pass_3db_frequency
/sys/…/in_anglvel_filter_low_pass_3db_frequency
```

---

Defined on file [sysfs-bus-iio](#)

If a known or controllable low pass filter is applied to the underlying data channel, then this parameter gives the 3dB frequency of the filter in Hz.

---

**/sys/…/mdev\_supported\_types/<type-id>/available\_instances**

---

Defined on file *sysfs-bus-vfio-mdev*

Reading this attribute will show the number of mediated devices of type <type-id> that can be created. This is a readonly file.

Users:

Userspace applications interested in creating mediated device of that type. Userspace application should check the number of available instances could be created before creating mediated device of this type.

---

**/sys/…/mdev\_supported\_types/<type-id>/create**

---

Defined on file *sysfs-bus-vfio-mdev*

Writing UUID to this file will create mediated device of type <type-id> for parent device <device>. This is a write-only file. For example:

```
# echo "83b8f4f2-509f-382f-3c1e-e6bfe0fa1001" > \
    /sys/devices/foo/mdev_supported_types/foo-1/create
```

---

**/sys/…/mdev\_supported\_types/<type-id>/description**

---

Defined on file *sysfs-bus-vfio-mdev*

Reading this attribute will show description of the type of mediated device that will get created of type <type-id>. This is optional attribute. For example: “2 heads, 512M FB, 2560x1600 maximum resolution”

Users:

Userspace applications interested in knowing the details of a particular <type-id> that can help in understanding the features provided by that type of mediated device.

---

**/sys/…/mdev\_supported\_types/<type-id>/device\_api**

---

Defined on file *sysfs-bus-vfio-mdev*

Reading this attribute will show VFIO device API supported by this type. For example, “vfio-pci” for a PCI device, “vfio-platform” for platform device.

---

**/sys/…/mdev\_supported\_types/<type-id>/devices/**

---

Defined on file *sysfs-bus-vfio-mdev*

This directory contains symbolic links pointing to mdev devices sysfs entries which are created of this <type-id>.

**/sys/…/mdev\_supported\_types/<type-id>/name**

Defined on file *sysfs-bus-vfio-mdev*

Reading this attribute will show human readable name of the mediated device that will get created of type <type-id>. This is optional attribute. For example: “Grid M60-0Q”

Users:

Userspace applications interested in knowing the name of a particular <type-id> that can help in understanding the type of mediated device.

**/sys/…/uevent**

Defined on file *sysfs-uevent*

Enable passing additional variables for synthetic uevents that are generated by writing /sys/…/uevent file.

Recognized extended format is:

ACTION [UUID [KEY=VALUE ...]]

The ACTION is compulsory - it is the name of the uevent action (add, change, remove). There is no change compared to previous functionality here. The rest of the extended format is optional.

You need to pass UUID first before any KEY=VALUE pairs. The UUID must be in xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx format where ‘x’ is a hex digit. The UUID is considered to be a transaction identifier so it’s possible to use the same UUID value for one or more synthetic uevents in which case we logically group these uevents together for any userspace listeners. The UUID value appears in uevent as SYNTH\_UUID=xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx environment variable.

If UUID is not passed in, the generated synthetic uevent gains SYNTH\_UUID=0 environment variable automatically.

The KEY=VALUE pairs can contain alphanumeric characters only.

It’s possible to define zero or more pairs - each pair is then delimited by a space character ‘ ’. Each pair appears in synthetic uevent as SYNTH\_ARG\_KEY=VALUE. That means the KEY name gains SYNTH\_ARG\_ prefix to avoid possible collisions with existing variables.

Example of valid sequence written to the uevent file:

```
add fe4d7c9d-b8c6-4a70-9ef1-3d8a58d18eed A=1 B=abc
```

This generates synthetic uevent including these variables:

```
ACTION=add
SYNTH_ARG_A=1
SYNTH_ARG_B=abc
SYNTH_UUID=fe4d7c9d-b8c6-4a70-9ef1-3d8a58d18eed
```

Users:

udev, userspace tools generating synthetic uevents

### 5.2.18 Symbols under /sys/block

#### /sys/block/\*/device/ncq\_prio\_enable

Defined on file *sysfs-block-device*

(RW) Write to the file to turn on or off the SATA ncq (native command queueing) support. By default this feature is turned off.

#### /sys/block/\*/device/sw\_activity

Defined on file *sysfs-block-device*

(RW) Used by drivers which support software controlled activity LEDs.

It has the following valid values:

- |   |   |
|---|---|
| 0 | OFF - the LED is not activated on activity  |
| 1 | BLINK_ON - the LED blinks on every 10ms when activity is detected.                        |
| 2 | BLINK_OFF - the LED is on when idle, and blinks off every 10ms when activity is detected. |

Note that the user must turn sw\_activity OFF if they wish to control the activity LED via the em\_message file.

#### /sys/block/\*/device/unload\_heads

Defined on file *sysfs-block-device*

(RW) Hard disk shock protection

Writing an integer value to this file will take the heads of the respective drive off the platter and block all I/O operations for the specified number of milliseconds.

- If the device does not support the unload heads feature, access is denied with -EOPNOTSUPP.
- The maximal value accepted for a timeout is 30000 milliseconds.
- A previously set timeout can be cancelled and disk can resume normal operation immediately by specifying a timeout of 0.
- Some hard drives only comply with an earlier version of the ATA standard, but support the unload feature nonetheless. There is no safe way Linux can detect these devices, so this is not enabled by default. If it is known that your device does support the unload feature, then you can tell the kernel to enable it by writing -1. It can be disabled again by writing -2.
- Values below -2 are rejected with -EINVAL

For more information, see [Hard disk shock protection](#)

### **/sys/block/<device>/iosched/target\_latency**

Defined on file [sysfs-cfq-target-latency](#)

The [/sys/block/<device>/iosched/target\\_latency](#) only exists when the user sets cfq to [/sys/block/<device>/scheduler](#). It contains an estimated latency time for the cfq. cfq will use it to calculate the time slice used for every task.

### **/sys/block/<disk>/<part>/stat**

Defined on file [sysfs-block](#)

The [/sys/block/<disk>/<part>/stat](#) files display the I/O statistics of partition <part>. The format is the same as the above-written [/sys/block/<disk>/stat](#) format.

### **/sys/block/<disk>/<partition>/alignment\_offset**

Defined on file [sysfs-block](#)

Storage devices may report a physical block size that is bigger than the logical block size (for instance a drive with 4KB physical sectors exposing 512-byte logical blocks to the operating system). This parameter indicates how many bytes the beginning of the partition is offset from the disk's natural alignment.

### **/sys/block/<disk>/<partition>/discard\_alignment**

Defined on file [sysfs-block](#)

Devices that support discard functionality may internally allocate space in units that are bigger than the exported logical block size. The `discard_alignment` parameter indicates how many bytes the beginning of the partition is offset from the internal allocation unit's natural alignment.

---

**/sys/block/<disk>/alignment\_offset**

---

Defined on file *sysfs-block*

Storage devices may report a physical block size that is bigger than the logical block size (for instance a drive with 4KB physical sectors exposing 512-byte logical blocks to the operating system). This parameter indicates how many bytes the beginning of the device is offset from the disk's natural alignment.

---

**/sys/block/<disk>/bcache/btree\_cache\_size**

---

Defined on file *sysfs-block-bcache*

Number of btree buckets/nodes that are currently cached in memory; cache dynamically grows and shrinks in response to memory pressure from the rest of the system.

---

**/sys/block/<disk>/bcache/btree\_written**

---

Defined on file *sysfs-block-bcache*

For a cache, sum of all btree writes in human readable units.

---

**/sys/block/<disk>/bcache/bucket\_size**

---

Defined on file *sysfs-block-bcache*

For a cache, bucket size in human readable units, as set at cache creation time; should match the erase block size of the SSD for optimal performance.

---

**/sys/block/<disk>/bcache/bypassed**

---

Defined on file *sysfs-block-bcache*

Sum of all reads and writes that have bypassed the cache (due to the sequential cutoff). Expressed as bytes in human readable units.

---

**/sys/block/<disk>/bcache/cache**

---

Defined on file *sysfs-block-bcache*

For a backing device that has cache, a symlink to the bcache/ dir of that cache.

---

**/sys/block/<disk>/bcache/cache\_hit\_ratio**

---

Defined on file *sysfs-block-bcache*

For backing devices: cache hits as a percentage.

### **/sys/block/<disk>/bcache/cache\_hits**

Defined on file *sysfs-block-bcache*

For backing devices: integer number of full cache hits, counted per bio. A partial cache hit counts as a miss.

### **/sys/block/<disk>/bcache/cache\_misses**

Defined on file *sysfs-block-bcache*

For backing devices: integer number of cache misses.

### **/sys/block/<disk>/bcache/clear\_stats**

Defined on file *sysfs-block-bcache*

Writing to this file resets all the statistics for the device.

### **/sys/block/<disk>/bcache/discard**

Defined on file *sysfs-block-bcache*

For a cache, a boolean allowing discard/TRIM to be turned off or back on if the device supports it.

### **/sys/block/<disk>/bcache/nbuckets**

Defined on file *sysfs-block-bcache*

For a cache, the number of usable buckets.

### **/sys/block/<disk>/bcache/sequential\_cutoff**

Defined on file *sysfs-block-bcache*

For backing devices: Threshold past which sequential IO will skip the cache. Read and written as bytes in human readable units (i.e. echo 10M > sequential\_cutoff).

### **/sys/block/<disk>/bcache/synchronous**

Defined on file *sysfs-block-bcache*

For a cache, a boolean that allows synchronous mode to be switched on and off. In synchronous mode all writes are ordered such that the cache can reliably recover from unclean shutdown; if disabled bcache will not generally wait for writes to complete but if the cache is not shut down cleanly all data will be discarded from the cache. Should not be turned off with writeback caching enabled.

**/sys/block/<disk>/bcache/tree\_depth**

Defined on file *sysfs-block-bcache*

For a cache, height of the btree excluding leaf nodes (i.e. a one node tree will have a depth of 0).

**/sys/block/<disk>/bcache/unregister**

Defined on file *sysfs-block-bcache*

A write to this file causes the backing device or cache to be unregistered. If a backing device had dirty data in the cache, writeback mode is automatically disabled and all dirty data is flushed before the device is unregistered. Caches unregister all associated backing devices before unregistering themselves.

**/sys/block/<disk>/bcache/writeback**

Defined on file *sysfs-block-bcache*

For backing devices: When on, writeback caching is enabled and writes will be buffered in the cache. When off, caching is in writethrough mode; reads and writes will be added to the cache but no write buffering will take place.

**/sys/block/<disk>/bcache/writeback\_delay**

Defined on file *sysfs-block-bcache*

For backing devices: In writeback mode, when dirty data is written to the cache and the cache held no dirty data for that backing device, writeback from cache to backing device starts after this delay, expressed as an integer number of seconds.

**/sys/block/<disk>/bcache/writeback\_percent**

Defined on file *sysfs-block-bcache*

For backing devices: If nonzero, writeback from cache to backing device only takes place when more than this percentage of the cache is used, allowing more write coalescing to take place and reducing total number of writes sent to the backing device. Integer between 0 and 40.

**/sys/block/<disk>/bcache/writeback\_running**

Defined on file *sysfs-block-bcache*

For backing devices: when off, dirty data will not be written from the cache to the backing device. The cache will still be used to buffer writes until it is mostly full, at which point writes transparently revert to writethrough mode. Intended only for benchmarking/testing.

### **/sys/block/<disk>/bcache/written**

Defined on file *sysfs-block-bcache*

For a cache, total amount of data in human readable units written to the cache, excluding all metadata.

### **/sys/block/<disk>/discard\_alignment**

Defined on file *sysfs-block*

Devices that support discard functionality may internally allocate space in units that are bigger than the exported logical block size. The `discard_alignment` parameter indicates how many bytes the beginning of the device is offset from the internal allocation unit's natural alignment.

### **/sys/block/<disk>/integrity/device\_is\_integrity\_capable**

Defined on file *sysfs-block*

Indicates whether a storage device is capable of storing integrity metadata. Set if the device is T10 PI-capable.

### **/sys/block/<disk>/integrity/format**

Defined on file *sysfs-block*

Metadata format for integrity capable block device. E.g. T10-DIF-TYPE1-CRC.

### **/sys/block/<disk>/integrity/protection\_interval\_bytes**

Defined on file *sysfs-block*

Describes the number of data bytes which are protected by one integrity tuple. Typically the device's logical block size.

### **/sys/block/<disk>/integrity/read\_verify**

Defined on file *sysfs-block*

Indicates whether the block layer should verify the integrity of read requests serviced by devices that support sending integrity metadata.

### **/sys/block/<disk>/integrity/tag\_size**

Defined on file *sysfs-block*

Number of bytes of integrity tag space available per 512 bytes of data.

---

**/sys/block/<disk>/integrity/write\_generate**

Defined on file *sysfs-block*

Indicates whether the block layer should automatically generate checksums for write requests bound for devices that support receiving integrity metadata.

---

**/sys/block/<disk>/queue/chunk\_sectors**

Defined on file *sysfs-block*

chunk\_sectors has different meaning depending on the type of the disk. For a RAID device (dm-raid), chunk\_sectors indicates the size in 512B sectors of the RAID volume stripe segment. For a zoned block device, either host-aware or host-managed, chunk\_sectors indicates the size in 512B sectors of the zones of the device, with the eventual exception of the last zone of the device which may be smaller.

---

**/sys/block/<disk>/queue/discard\_granularity**

Defined on file *sysfs-block*

Devices that support discard functionality may internally allocate space using units that are bigger than the logical block size. The discard\_granularity parameter indicates the size of the internal allocation unit in bytes if reported by the device. Otherwise the discard\_granularity will be set to match the device's physical block size. A discard\_granularity of 0 means that the device does not support discard functionality.

---

**/sys/block/<disk>/queue/discard\_max\_bytes**

Defined on file *sysfs-block*

Devices that support discard functionality may have internal limits on the number of bytes that can be trimmed or unmapped in a single operation. Some storage protocols also have inherent limits on the number of blocks that can be described in a single command. The discard\_max\_bytes parameter is set by the device driver to the maximum number of bytes that can be discarded in a single operation. Discard requests issued to the device must not exceed this limit. A discard\_max\_bytes value of 0 means that the device does not support discard functionality.

---

**/sys/block/<disk>/queue/discard\_zeroes\_data**

Defined on file *sysfs-block*

Will always return 0. Don't rely on any specific behavior for discards, and don't read this file.

### **/sys/block/<disk>/queue/io\_timeout**

Defined on file *sysfs-block*

io\_timeout is the request timeout in milliseconds. If a request does not complete in this time then the block driver timeout handler is invoked. That timeout handler can decide to retry the request, to fail it or to start a device recovery strategy.

### **/sys/block/<disk>/queue/logical\_block\_size**

Defined on file *sysfs-block*

This is the smallest unit the storage device can address. It is typically 512 bytes.

### **/sys/block/<disk>/queue/max\_active\_zones**

Defined on file *sysfs-block*

For zoned block devices (zoned attribute indicating “host-managed” or “host-aware”), the sum of zones belonging to any of the zone states: EXPLICIT OPEN, IMPLICIT OPEN or CLOSED, is limited by this value. If this value is 0, there is no limit.

### **/sys/block/<disk>/queue/max\_open\_zones**

Defined on file *sysfs-block*

For zoned block devices (zoned attribute indicating “host-managed” or “host-aware”), the sum of zones belonging to any of the zone states: EXPLICIT OPEN or IMPLICIT OPEN, is limited by this value. If this value is 0, there is no limit.

### **/sys/block/<disk>/queue/minimum\_io\_size**

Defined on file *sysfs-block*

Storage devices may report a granularity or preferred minimum I/O size which is the smallest request the device can perform without incurring a performance penalty. For disk drives this is often the physical block size. For RAID arrays it is often the stripe chunk size. A properly aligned multiple of minimum\_io\_size is the preferred request size for workloads where a high number of I/O operations is desired.

### **/sys/block/<disk>/queue/nomerges**

Defined on file *sysfs-block*

Standard I/O elevator operations include attempts to merge contiguous I/Os. For known random I/O loads these attempts will always fail and result in extra cycles

being spent in the kernel. This allows one to turn off this behavior on one of two ways: When set to 1, complex merge checks are disabled, but the simple one-shot merges with the previous I/O request are enabled. When set to 2, all merge tries are disabled. The default value is 0 - which enables all types of merge tries.

### /sys/block/<disk>/queue/nr\_zones

Defined on file *sysfs-block*

nr\_zones indicates the total number of zones of a zoned block device (“host-aware” or “host-managed” zone model). For regular block devices, the value is always 0.

### /sys/block/<disk>/queue/optimal\_io\_size

Defined on file *sysfs-block*

Storage devices may report an optimal I/O size, which is the device’s preferred unit for sustained I/O. This is rarely reported for disk drives. For RAID arrays it is usually the stripe width or the internal track size. A properly aligned multiple of optimal\_io\_size is the preferred request size for workloads where sustained throughput is desired. If no optimal I/O size is reported this file contains 0.

### /sys/block/<disk>/queue/physical\_block\_size

Defined on file *sysfs-block*

This is the smallest unit a physical storage device can write atomically. It is usually the same as the logical block size but may be bigger. One example is SATA drives with 4KB sectors that expose a 512-byte logical block size to the operating system. For stacked block devices the physical\_block\_size variable contains the maximum physical\_block\_size of the component devices.

### /sys/block/<disk>/queue/write\_same\_max\_bytes

Defined on file *sysfs-block*

Some devices support a write same operation in which a single data block can be written to a range of several contiguous blocks on storage. This can be used to wipe areas on disk or to initialize drives in a RAID configuration. write\_same\_max\_bytes indicates how many bytes can be written in a single write same command. If write\_same\_max\_bytes is 0, write same is not supported by the device.

### /sys/block/<disk>/queue/write\_zeroes\_max\_bytes

Defined on file *sysfs-block*

Devices that support write zeroes operation in which a single request can be issued to zero out the range of contiguous blocks on storage without having any

payload in the request. This can be used to optimize writing zeroes to the devices. write\_zeroes\_max\_bytes indicates how many bytes can be written in a single write zeroes command. If write\_zeroes\_max\_bytes is 0, write zeroes is not supported by the device.

### /sys/block/<disk>/queue/zoned

Defined on file [sysfs-block](#)

zoned indicates if the device is a zoned block device and the zone model of the device if it is indeed zoned. The possible values indicated by zoned are “none” for regular block devices and “host-aware” or “host-managed” for zoned block devices. The characteristics of host-aware and host-managed zoned block devices are described in the ZBC (Zoned Block Commands) and ZAC (Zoned Device ATA Command Set) standards. These standards also define the “drive-managed” zone model. However, since drive-managed zoned block devices do not support zone commands, they will be treated as regular block devices and zoned will report “none” .

### /sys/block/<disk>/stat

Defined on file [sysfs-block](#)

The [/sys/block/<disk>/stat](#) files displays the I/O statistics of disk <disk>. They contain 11 fields:

1	reads completed successfully
2	reads merged
3	sectors read
4	time spent reading (ms)
5	writes completed
6	writes merged
7	sectors written
8	time spent writing (ms)
9	I/Os currently in progress
10	time spent doing I/Os (ms)
11	weighted time spent doing I/Os (ms)
12	discards completed
13	discards merged
14	sectors discarded
15	time spent discarding (ms)
16	flush requests completed
17	time spent flushing (ms)

For more details refer [I/O statistics fields](#)

### /sys/block/dm-<num>/dm/name

Defined on file [sysfs-block-dm](#)

Device-mapper device name. Read-only string containing mapped device name.  
Users: util-linux, device-mapper udev rules

---

**/sys/block/dm-<num>/dm/rq\_based\_seq\_io\_merge\_deadline**

---

Defined on file *sysfs-block-dm*

Allow control over how long a request that is a reasonable merge candidate can be queued on the request queue. The resolution of this deadline is in microseconds (ranging from 1 to 100000 usecs). Setting this attribute to 0 (the default) will disable request-based DM's merge heuristic and associated extra accounting. This attribute is not applicable to bio-based DM devices so it will only ever report 0 for them.

---

**/sys/block/dm-<num>/dm/suspended**

---

Defined on file *sysfs-block-dm*

Device-mapper device suspend state. Contains the value 1 while the device is suspended. Otherwise it contains 0. Read-only attribute.

Users: util-linux, device-mapper udev rules

---

**/sys/block/dm-<num>/dm/use\_blk\_mq**

---

Defined on file *sysfs-block-dm*

Request-based Device-mapper blk-mq I/O path mode. Contains the value 1 if the device is using blk-mq. Otherwise it contains 0. Read-only attribute.

---

**/sys/block/dm-<num>/dm/uuid**

---

Defined on file *sysfs-block-dm*

Device-mapper device UUID. Read-only string containing DM-UUID or empty string if DM-UUID is not set.

Users: util-linux, device-mapper udev rules

---

**/sys/block/etherd\*/firmware-version**

---

Defined on file *sysfs-block-aoe*

(RO) Version of the firmware in the target.

---

**/sys/block/etherd\*/mac**

---

Defined on file *sysfs-block-aoe*

(RO) The ethernet address of the remote Ata over Ethernet (AoE) device.

### **/sys/block/etherd\*/netif**

Defined on file *sysfs-block-aoe*

(RO) The names of the network interfaces on the localhost (comma separated) through which we are communicating with the remote AoE device.

### **/sys/block/etherd\*/payload**

Defined on file *sysfs-block-aoe*

(RO) The amount of user data transferred (in bytes) inside each AoE command on the network, network headers excluded.

### **/sys/block/etherd\*/state**

Defined on file *sysfs-block-aoe*

(RO) Device status. The state attribute is “up” when the device is ready for I/O and “down” if detected but unusable. The “down,closewait” state shows that the device is still open and cannot come up again until it has been closed. The “up,kickme” state means that the driver wants to send more commands to the target but found out there were already the max number of commands waiting for a response. It will retry again after being kicked by the periodic timer handler routine.

### **/sys/block/loopX/loop/autoclear**

Defined on file *sysfs-block-loop*

(RO) Shows if the device is in autoclear mode or not ( “1” or “0” ). Autoclear (if set) indicates that the loopback device will self-destruct after last close.

### **/sys/block/loopX/loop/backing\_file**

Defined on file *sysfs-block-loop*

(RO) The path of the backing file that the loop device maps its data blocks to.

### **/sys/block/loopX/loop/dio**

Defined on file *sysfs-block-loop*

(RO) Shows if direct IO is being used to access backing file or not ( “1” or “0” ).

### **/sys/block/loopX/loop/offset**

Defined on file *sysfs-block-loop*

(RO) Start offset (in bytes).

---

**/sys/block/loopX/loop/partscan**

---

Defined on file *sysfs-block-loop*

(RO) Shows if automatic partition scanning is enabled for the device or not ( “1” or “0” ). This can be requested individually per loop device during its setup by setting LO\_FLAGS\_PARTSCAN in in the ioctl request. By default, no partition tables are scanned.

---

**/sys/block/loopX/loop/sizelimit**

---

Defined on file *sysfs-block-loop*

(RO) The size (in bytes) that the block device maps, starting from the offset.

---

**/sys/block/rnbd<N>/rnbd/access\_mode**

---

Defined on file *sysfs-block-rnbd*

Contains the device access mode: ro, rw or migration.

---

**/sys/block/rnbd<N>/rnbd/mapping\_path**

---

Defined on file *sysfs-block-rnbd*

Contains the path that was passed as “device\_path” to the map\_device operation.

---

**/sys/block/rnbd<N>/rnbd/session**

---

Defined on file *sysfs-block-rnbd*

RNBD uses RTRS session to transport the data between client and server. The entry “session” contains the name of the session, that was used to establish the RTRS session. It’ s the same name that was passed as server parameter to the map\_device entry.

---

**/sys/block/rnbd<N>/rnbd/state**

---

Defined on file *sysfs-block-rnbd*

The file contains the current state of the block device. The state file returns “open” when the device is successfully mapped from the server and accepting I/O requests. When the connection to the server gets disconnected in case of an error (e.g. link failure), the state file returns “closed” and all I/O requests submitted to it will fail with -EIO.

### **/sys/block/rnbd<N>/rnbd/unmap\_device**

Defined on file *sysfs-block-rnbd*

To unmap a volume, “normal” or “force” has to be written to: */sys/block/rnbd<N>/rnbd/unmap\_device*

When “normal” is used, the operation will fail with EBUSY if any process is using the device. When “force” is used, the device is also unmapped when device is in use. All I/Os that are in progress will fail.

Example:

```
# echo "normal" > /sys/block/rnbd0/rnbd/unmap_device
```

### **/sys/block/rssd\*/status**

Defined on file *sysfs-block-rssd*

This is a read-only file. Indicates the status of the device.

### **/sys/block/zram<id>/backing\_dev**

Defined on file *sysfs-block-zram*

The backing\_dev file is read-write and set up backing device for zram to write incompressible pages. For using, user should enable CONFIG\_ZRAM\_WRITEBACK.

### **/sys/block/zram<id>/bd\_stat**

Defined on file *sysfs-block-zram*

The bd\_stat file is read-only and represents backing device’s statistics (bd\_count, bd\_reads, bd\_writes) in a format similar to block layer statistics file format.

### **/sys/block/zram<id>/comp\_algorithm**

Defined on file *sysfs-block-zram*

The comp\_algorithm file is read-write and lets to show available and selected compression algorithms, change compression algorithm selection.

### **/sys/block/zram<id>/compact**

Defined on file *sysfs-block-zram*

The compact file is write-only and trigger compaction for allocator zrm uses. The allocator moves some objects so that it could free fragment space.

---

**/sys/block/zram<id>/debug\_stat**

Defined on file *sysfs-block-zram*

The debug\_stat file is read-only and represents various device's debugging info useful for kernel developers. Its format is not documented intentionally and may change anytime without any notice.

---

**/sys/block/zram<id>/disksize**

Defined on file *sysfs-block-zram*

The disksize file is read-write and specifies the disk size which represents the limit on the *uncompressed* worth of data that can be stored in this disk. Unit: bytes

---

**/sys/block/zram<id>/idle**

Defined on file *sysfs-block-zram*

idle file is write-only and mark zram slot as idle. If system has mounted debugfs, user can see which slots are idle via /sys/kernel/debug/zram/zram<id>/block\_state

---

**/sys/block/zram<id>/initstate**

Defined on file *sysfs-block-zram*

The initstate file is read-only and shows the initialization state of the device.

---

**/sys/block/zram<id>/io\_stat**

Defined on file *sysfs-block-zram*

The io\_stat file is read-only and accumulates device's I/O statistics not accounted by block layer. For example, failed\_reads, failed\_writes, etc. File format is similar to block layer statistics file format.

---

**/sys/block/zram<id>/max\_comp\_streams**

Defined on file *sysfs-block-zram*

The max\_comp\_streams file is read-write and specifies the number of backend's zcomp\_strm compression streams (number of concurrent compress operations).

---

**/sys/block/zram<id>/mem\_limit**

Defined on file *sysfs-block-zram*

The mem\_limit file is write-only and specifies the maximum amount of memory ZRAM can use to store the compressed data. The limit could be changed in run time and “0” means disable the limit. No limit is the initial state. Unit: bytes

### **/sys/block/zram<id>/mem\_used\_max**

Defined on file *sysfs-block-zram*

The mem\_used\_max file is write-only and is used to reset the counter of maximum memory zram have consumed to store compressed data. For resetting the value, you should write “0”. Otherwise, you could see -EINVAL. Unit: bytes

### **/sys/block/zram<id>/mm\_stat**

Defined on file *sysfs-block-zram*

The mm\_stat file is read-only and represents device’s mm statistics (orig\_data\_size, compr\_data\_size, etc.) in a format similar to block layer statistics file format.

### **/sys/block/zram<id>/reset**

Defined on file *sysfs-block-zram*

The reset file is write-only and allows resetting the device. The reset operation frees all the memory associated with this device.

### **/sys/block/zram<id>/writeback**

Defined on file *sysfs-block-zram*

The writeback file is write-only and trigger idle and/or huge page writeback to backing device.

### **/sys/block/zram<id>/writeback\_limit**

Defined on file *sysfs-block-zram*

The writeback\_limit file is read-write and specifies the maximum amount of write-back ZRAM can do. The limit could be changed in run time.

### **/sys/block/zram<id>/writeback\_limit\_enable**

Defined on file *sysfs-block-zram*

The writeback\_limit\_enable file is read-write and specifies enable of writeback\_limit feature. “1” means enable the feature. No limit “0” is the initial state.

### 5.2.19 Symbols under /sys/bus

#### /sys/bus/\*/drivers/ufshcd/\*/auto\_hibern8

Defined on file *sysfs-driver-ufs*

This file contains the auto-hibernate idle timer setting of a UFS host controller. A value of ‘0’ means auto-hibernate is not enabled. Otherwise the value is the number of microseconds of idle time before the UFS host controller will autonomously put the link into hibernate state. That will save power at the expense of increased latency. Note that the hardware supports 10-bit values with a power-of-ten multiplier which allows a maximum value of 102300000. Refer to the UFS Host Controller Interface specification for more details.

#### /sys/bus/acpi/devices/…/adr

Defined on file *sysfs-bus-acpi*

This attribute contains the output of the device object’s \_ADR control method, which is present for ACPI device objects representing devices having standard enumeration algorithms, such as PCI.

#### /sys/bus/acpi/devices/…/description

Defined on file *sysfs-bus-acpi*

This attribute contains the output of the device object’s \_STR control method, if present.

#### /sys/bus/acpi/devices/…/eject

Defined on file *sysfs-bus-acpi*

Writing 1 to this attribute will trigger hot removal of this device object. This file exists for every device object that has \_EJ0 method.

#### /sys/bus/acpi/devices/…/hid

Defined on file *sysfs-bus-acpi*

This attribute indicates the hardware ID (\_HID) of the device object. For example, PNP0103. This file is present for device objects having the \_HID control method.

#### /sys/bus/acpi/devices/…/hrv

Defined on file *sysfs-bus-acpi*

(RO) Allows users to read the hardware version of non-PCI hardware, if the \_HRV control method is present. It is mostly useful for non-PCI devices because lspci can list the hardware version for PCI devices.

### /sys/bus/acpi/devices/…/modalias

Defined on file *sysfs-bus-acpi*

This attribute indicates the PNP IDs of the device object. That is acpi:HHHHHHHH:[CCCCCCC:] . Where each HHHHHHHH or CCCCCCCC contains device object' s PNPID (\_HID or \_CID).

### /sys/bus/acpi/devices/…/path

Defined on file *sysfs-bus-acpi*

This attribute indicates the full path of ACPI namespace object associated with the device object. For example, \_SB\_.PCI0.

This file is not present for device objects representing fixed ACPI hardware features (like power and sleep buttons).

### /sys/bus/acpi/devices/…/status

Defined on file *sysfs-bus-acpi*

(RO) Returns the ACPI device status: enabled, disabled or functioning or present, if the method \_STA is present.

The return value is a decimal integer representing the device' s status bitmap:

Bit [0]	Set if the device is present.
Bit [1]	Set if the device is enabled and decoding its resources.
Bit [2]	Set if the device should be shown in the UI.
Bit [3]	Set if the device is functioning properly (cleared if device failed its diagnostics).
Bit [4]	Set if the battery is present.
Bits [31:5]	Reserved (must be cleared)

If bit [0] is clear, then bit 1 must also be clear (a device that is not present cannot be enabled).

Bit 0 can be clear (not present) with bit [3] set (device is functional). This case is used to indicate a valid device for which no device driver should be loaded.

More special cases are covered in the ACPI specification.

### /sys/bus/acpi/devices/…/uid

Defined on file *sysfs-bus-acpi*

This attribute contains the output of the device object' s \_UID control method, if present.

---

**/sys/bus/acpi/intel-rapid-start/wakeup\_events**

---

Defined on file *sysfs-driver-intel-rapid-start*

An integer representing a set of wakeup events as follows: 1: Wake to enter hibernation when the wakeup timer expires 2: Wake to enter hibernation when the battery reaches a critical level

These values are ORed together. For example, a value of 3 indicates that the system will wake to enter hibernation when either the wakeup timer expires or the battery reaches a critical level.

---

**/sys/bus/acpi/intel-rapid-start/wakeup\_time**

---

Defined on file *sysfs-driver-intel-rapid-start*

An integer representing the length of time the system will remain asleep before waking up to enter hibernation. This value is in minutes.

---

**/sys/bus/amba/devices/…/driver\_override**

---

Defined on file *sysfs-bus-amba*

This file allows the driver for a device to be specified which will override standard OF, ACPI, ID table, and name matching. When specified, only a driver with a name matching the value written to driver\_override will have an opportunity to bind to the device. The override is specified by writing a string to the driver\_override file (echo vfio-amba > driver\_override) and may be cleared with an empty string (echo > driver\_override). This returns the device to standard matching rules binding. Writing to driver\_override does not automatically unbind the device from its current driver or make any attempt to automatically load the specified driver. If no driver with a matching name is currently loaded in the kernel, the device will not bind to any driver. This also allows devices to opt-out of driver binding using a driver\_override name such as "none". Only a single driver may be specified in the override, there is no support for parsing delimiters.

---

**/sys/bus/bcma/devices/…/class**

---

Defined on file *sysfs-bus-bcma*

Each BCMA core is identified by few fields, including class it belongs to. See include/linux/bcma/bcma.h for possible values.

---

**/sys/bus/bcma/devices/…/id**

---

Defined on file *sysfs-bus-bcma*

There are a few types of BCMA cores, they can be identified by id field.

### **/sys/bus/bcma/devices/…/manuf**

Defined on file *sysfs-bus-bcma*

Each BCMA core has it's manufacturer id. See include/linux/bcma/bcma.h for possible values.

### **/sys/bus/bcma/devices/…/rev**

Defined on file *sysfs-bus-bcma*

BCMA cores of the same type can still slightly differ depending on their revision. Use it for detailed programming.

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_clear**

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Deactivate a single channel.

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_free**

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) show channels with no attached trigger signals.

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_gate\_disable**

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Disable CTIGATE for single channel.

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_gate\_enable**

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Enable CTIGATE for single channel (Write) or list enabled channels through the gate (R).

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_inuse**

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) show channels with at least one attached trigger signal.

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_pulse**

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Pulse a single channel - activate for a single clock cycle.

---

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_set**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Activate a single channel.

---

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_xtrigs\_in**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Read to see input triggers connected to selected view channel.

---

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_xtrigs\_out**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Read to see output triggers connected to selected view channel.

---

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_xtrigs\_reset**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Clear all channel / trigger programming.

---

### **/sys/bus/coresight/devices/<cti-name>/channels/chan\_xtrigs\_sel**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Write channel number to select a channel to view, read to see selected channel number.

---

### **/sys/bus/coresight/devices/<cti-name>/channels/trig\_filter\_enable**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Enable or disable trigger output signal filtering.

---

### **/sys/bus/coresight/devices/<cti-name>/channels/trigin\_attach**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Attach a CTI input trigger to a CTM channel.

---

### **/sys/bus/coresight/devices/<cti-name>/channels/trigin\_detach**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Detach a CTI input trigger from a CTM channel.

---

**/sys/bus/coresight/devices/<cti-name>/channels/trigout\_attach**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Attach a CTI output trigger to a CTM channel.

---

**/sys/bus/coresight/devices/<cti-name>/channels/trigout\_detach**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Detach a CTI output trigger from a CTM channel.

---

**/sys/bus/coresight/devices/<cti-name>/channels/trigout\_filtered**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) List of output triggers filtered across all connections.

---

**/sys/bus/coresight/devices/<cti-name>/ctmid**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Display the associated CTM ID

---

**/sys/bus/coresight/devices/<cti-name>/enable**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Enable/Disable the CTI hardware.

---

**/sys/bus/coresight/devices/<cti-name>/nr\_trigger\_cons**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Number of devices connected to triggers on this CTI

---

**/sys/bus/coresight/devices/<cti-name>/powered**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Indicate if the CTI hardware is powered.

---

**/sys/bus/coresight/devices/<cti-name>/regs/appclear**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Write APPCLEAR register to deactivate channel.

---

### **/sys/bus/coresight/devices/<cti-name>/regs/apppulse**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Write APPPULSE to pulse a channel active for one clock cycle.

---

### **/sys/bus/coresight/devices/<cti-name>/regs/appset**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Set CTIAPPSET register to activate channel. Read back to determine current value of register.

---

### **/sys/bus/coresight/devices/<cti-name>/regs/asicctl**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Read or write ASICCTL register.

---

### **/sys/bus/coresight/devices/<cti-name>/regs/chinstatus**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Read current status of channel inputs.

---

### **/sys/bus/coresight/devices/<cti-name>/regs/choutstatus**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) read current status of channel outputs.

---

### **/sys/bus/coresight/devices/<cti-name>/regs/gate**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Read or write CTIGATE register.

---

### **/sys/bus/coresight/devices/<cti-name>/regs/inen**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Read or write the CTIINEN register selected by inout\_sel.

---

### **/sys/bus/coresight/devices/<cti-name>/regs/inout\_sel**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Select the index for inen and outen registers.

---

**/sys/bus/coresight/devices/<cti-name>/regs/intack**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Write) Write the INTACK register.

---

**/sys/bus/coresight/devices/<cti-name>/regs/outen**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(RW) Read or write the CTIOUTEN register selected by inout\_sel.

---

**/sys/bus/coresight/devices/<cti-name>/regs/triginstatus**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) read current status of input trigger signals

---

**/sys/bus/coresight/devices/<cti-name>/regs/trigoutstatus**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) read current status of output trigger signals.

---

**/sys/bus/coresight/devices/<cti-name>/triggers<N>/in\_signals**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Input trigger signals from connected device <N>

---

**/sys/bus/coresight/devices/<cti-name>/triggers<N>/in\_types**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Functional types for the input trigger signals from connected device <N>

---

**/sys/bus/coresight/devices/<cti-name>/triggers<N>/name**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Name of connected device <N>

---

**/sys/bus/coresight/devices/<cti-name>/triggers<N>/out\_signals**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Output trigger signals to connected device <N>

---

**/sys/bus/coresight/devices/<cti-name>/triggers<N>/out\_types**

---

Defined on file *sysfs-bus-coresight-devices-cti*

(Read) Functional types for the output trigger signals to connected device <N>

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/addr\_acctype**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used in conjunction with @addr\_idx. Specifies characteristics about the address comparator being configured, for example the access type, the kind of instruction to trace, processor context ID to trigger on, etc. Individual fields in the access type register may vary on the version of the trace entity.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/addr\_idx**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

Select which address comparator or pair (of comparators) to work with.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/addr\_range**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used in conjunction with @addr\_idx. Specifies the range of addresses to trigger on. Inclusion or exclusion is specified in the corresponding access type register.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/addr\_single**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used in conjunction with @addr\_idx. Specifies the single address to trigger on, highly influenced by the configuration options of the corresponding access type register.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/addr\_start**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used in conjunction with @addr\_idx. Specifies the single address to start tracing on, highly influenced by the configuration options of the corresponding access type register.

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/addr\_stop**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used in conjunction with @addr\_idx. Specifies the single address to stop tracing on, highly influenced by the configuration options of the corresponding access type register.

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/cntr\_event**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used in conjunction with cntr\_idx, give access to the counter event register.

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/cntr\_idx**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Specifies the counter to work on.

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/cntr\_rld\_event**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used in conjunction with cntr\_idx, give access to the counter reload event register.

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/cntr\_rld\_val**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used in conjunction with cntr\_idx, give access to the counter reload value register.

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/cntr\_val**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used in conjunction with cntr\_idx, give access to the counter value register.

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/cpu**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Holds the cpu number this tracer is affined to.

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/ctxid\_idx**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Specifies the index of the context ID register to be selected.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/ctxid\_mask**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Mask to apply to all the context ID comparator.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/ctxid\_pid**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Used with the ctxid\_idx, specify with context ID to trigger on.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/curr\_seq\_state**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(Read) Holds the current state of the sequencer.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/enable\_event**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Defines which event triggers a trace.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/enable\_source**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Enable/disable tracing on this specific trace entry. Enabling a source implies the source has been configured properly and a sink has been identified for it. The path of coresight components linking the source to the sink is configured and managed automatically by the coresight framework.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/etmsr**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Gives access to the ETM status register, which holds programming information and status on certain events.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/fifo\_full\_level**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Number of byte left in the fifo before considering it full. Depending on the tracer's version, can also hold threshold for data suppression.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmccer**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM Configuration Code Extension register (0x1e8). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmccr**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM Configuration Code register (0x004). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmcr**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM Main Control register (0x000). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmidr**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM ID register (0x1e4). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmscr**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM System Configuration register (0x014). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmtecr1**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM Enable Conrol #1 register (0x024). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmtecr2**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM Enable Control #2 register (0x01c). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmteevr**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM Trace Enable Event register (0x020). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmtraceidr**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM Trace ID register (0x200). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mgmt/etmtsscr**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RO) Print the content of the ETM Trace Start/Stop Control register (0x018). The value is read directly from the HW.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/mode**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Interface with the driver's 'mode' field, controlling various aspects of the trace entity such as time stamping, context ID size and cycle accurate tracing. Driver specific and bound to change depending on the driver.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/nr\_addr\_cmp**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(Read) Provides the number of address comparators pairs accessible on a trace unit, as specified by bit 3:0 of register ETMCCR.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/nr\_cntr**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(Read) Provides the number of counters accessible on a trace unit, as specified by bit 15:13 of register ETMCCR.

---

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/nr\_ctxid\_cmp**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(Read) Provides the number of context ID comparator available on a trace unit, as specified by bit 25:24 of register ETMCCR.

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/reset**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(Write) Cancels all configuration on a trace unit and set it back to its boot configuration.

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/seq\_12\_event**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Defines the event that causes the sequencer to transition from state 1 to state 2.

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/seq\_13\_event**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Defines the event that causes the sequencer to transition from state 1 to state 3.

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/seq\_21\_event**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Defines the event that causes the sequencer to transition from state 2 to state 1.

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/seq\_23\_event**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Defines the event that causes the sequencer to transition from state 2 to state 3.

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/seq\_31\_event**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Defines the event that causes the sequencer to transition from state 3 to state 1.

**/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/seq\_32\_event**

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Defines the event that causes the sequencer to transition from state 3 to state 2.

---

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/sync\_freq**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Holds the trace synchronization frequency value - must be programmed with the various implementation behavior in mind.

---

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/timestamp\_event**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Defines an event that requests the insertion of a timestamp into the trace stream.

---

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/traceid**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Holds the trace ID that will appear in the trace stream coming from this trace entity.

---

### **/sys/bus/coresight/devices/<memory\_map>.[etm|ptm]/trigger\_event**

---

Defined on file *sysfs-bus-coresight-devices-etm3x*

(RW) Define the event that controls the trigger.

---

### **/sys/bus/coresight/devices/<memory\_map>.etb/enable\_sink**

---

Defined on file *sysfs-bus-coresight-devices-etb10*

(RW) Add/remove a sink from a trace path. There can be multiple source for a single sink.

ex:

```
echo 1 > /sys/bus/coresight/devices/20010000.etb/enable_sink
```

---

### **/sys/bus/coresight/devices/<memory\_map>.etb/mgmt/ctl**

---

Defined on file *sysfs-bus-coresight-devices-etb10*

(Read) Shows the value held by the ETB Control register. The value is read directly from HW register CTL, 0x020.

### **/sys/bus/coresight/devices/<memory\_map>.etb/mgmt/ffcr**

Defined on file *sysfs-bus-coresight-devices-etb10*

(Read) Shows the value held by the ETB Formatter and Flush Control register. The value is read directly from HW register FFCR, 0x304.

### **/sys/bus/coresight/devices/<memory\_map>.etb/mgmt/ffsr**

Defined on file *sysfs-bus-coresight-devices-etb10*

(Read) Shows the value held by the ETB Formatter and Flush Status register. The value is read directly from HW register FFSR, 0x300.

### **/sys/bus/coresight/devices/<memory\_map>.etb/mgmt/rdp**

Defined on file *sysfs-bus-coresight-devices-etb10*

(Read) Defines the depth, in words, of the trace RAM in powers of 2. The value is read directly from HW register RDP, 0x004.

### **/sys/bus/coresight/devices/<memory\_map>.etb/mgmt/rrp**

Defined on file *sysfs-bus-coresight-devices-etb10*

(Read) Shows the value held by the ETB RAM Read Pointer register that is used to read entries from the Trace RAM over the APB interface. The value is read directly from HW register RRP, 0x014.

### **/sys/bus/coresight/devices/<memory\_map>.etb/mgmt/rwp**

Defined on file *sysfs-bus-coresight-devices-etb10*

(Read) Shows the value held by the ETB RAM Write Pointer register that is used to sets the write pointer to write entries from the CoreSight bus into the Trace RAM. The value is read directly from HW register RWP, 0x018.

### **/sys/bus/coresight/devices/<memory\_map>.etb/mgmt/sts**

Defined on file *sysfs-bus-coresight-devices-etb10*

(Read) Shows the value held by the ETB status register. The value is read directly from HW register STS, 0x00C.

### **/sys/bus/coresight/devices/<memory\_map>.etb/mgmt/trg**

Defined on file *sysfs-bus-coresight-devices-etb10*

(Read) Similar to “trigger\_cntr” above except that this value is read directly from HW register TRG, 0x01C.

---

**/sys/bus/coresight/devices/<memory\_map>.etb/trigger\_cntr**

---

Defined on file *sysfs-bus-coresight-devices-etb10*

(RW) Disables write access to the Trace RAM by stopping the formatter after a defined number of words have been stored following the trigger event. The number of 32-bit words written into the Trace RAM following the trigger event is equal to the value stored in this register+1 (from ARM ETB-TRM).

---

**/sys/bus/coresight/devices/<memory\_map>.funnel/funnel\_ctrl**

---

Defined on file *sysfs-bus-coresight-devices-funnel*

(RW) Enables the slave ports and defines the hold time of the slave ports.

---

**/sys/bus/coresight/devices/<memory\_map>.funnel/priority**

---

Defined on file *sysfs-bus-coresight-devices-funnel*

(RW) Defines input port priority order.

---

**/sys/bus/coresight/devices/<memory\_map>.stm/enable\_source**

---

Defined on file *sysfs-bus-coresight-devices-stm*

(RW) Enable/disable tracing on this specific trace macrocell. Enabling the trace macrocell implies it has been configured properly and a sink has been identified for it. The path of coresight components linking the source to the sink is configured and managed automatically by the coresight framework.

---

**/sys/bus/coresight/devices/<memory\_map>.stm/hwevent\_enable**

---

Defined on file *sysfs-bus-coresight-devices-stm*

(RW) Provides access to the HW event enable register, used in conjunction with HW event bank select register.

---

**/sys/bus/coresight/devices/<memory\_map>.stm/hwevent\_select**

---

Defined on file *sysfs-bus-coresight-devices-stm*

(RW) Gives access to the HW event block select register (STMHEBSR) in order to configure up to 256 channels. Used in conjunction with “hwevent\_enable” register as described above.

---

**/sys/bus/coresight/devices/<memory\_map>.stm/port\_enable**

---

Defined on file *sysfs-bus-coresight-devices-stm*

(RW) Provides access to the stimulus port enable register (STMSPER). Used in conjunction with “port\_select” described below.

---

### **/sys/bus/coresight/devices/<memory\_map>.stm/port\_select**

---

Defined on file *sysfs-bus-coresight-devices-stm*

(RW) Used to determine which bank of stimulus port bit in register STMSPER (see above) apply to.

---

### **/sys/bus/coresight/devices/<memory\_map>.stm/status**

---

Defined on file *sysfs-bus-coresight-devices-stm*

(Read) List various control and status registers. The specific layout and content is driver specific.

---

### **/sys/bus/coresight/devices/<memory\_map>.stm/traceid**

---

Defined on file *sysfs-bus-coresight-devices-stm*

(RW) Holds the trace ID that will appear in the trace stream coming from this trace entity.

---

### **/sys/bus/coresight/devices/<memory\_map>.tmc/buffer\_size**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(RW) Size of the trace buffer for TMC-ETR when used in SYSFS mode. Writable only for TMC-ETR configurations. The value should be aligned to the kernel page-size.

---

### **/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/ctl**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Shows the value held by the TMC Control register. The value is read directly from HW register CTL, 0x020.

---

### **/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/devid**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Indicates the capabilities of the Coresight TMC. The value is read directly from the DEVID register, 0xFC8,

---

### **/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/ffcr**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Shows the value held by the TMC Formatter and Flush Control register. The value is read directly from HW register FFCR, 0x304.

---

**/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/ffsr**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Shows the value held by the TMC Formatter and Flush Status register. The value is read directly from HW register FFSR, 0x300.

---

**/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/mode**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Shows the value held by the TMC Mode register, which indicate the mode the device has been configured to enact. The value is read directly from the MODE register, 0x028.

---

**/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/rrp**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Shows the value held by the TMC RAM Read Pointer register that is used to read entries from the Trace RAM over the APB interface. The value is read directly from HW register RRP, 0x014.

---

**/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/rsz**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Defines the size, in 32-bit words, of the local RAM buffer. The value is read directly from HW register RSZ, 0x004.

---

**/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/rwp**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Shows the value held by the TMC RAM Write Pointer register that is used to sets the write pointer to write entries from the CoreSight bus into the Trace RAM. The value is read directly from HW register RWP, 0x018.

---

**/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/sts**

---

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Shows the value held by the TMC status register. The value is read directly from HW register STS, 0x00C.

### **/sys/bus/coresight/devices/<memory\_map>.tmc/mgmt/trg**

Defined on file *sysfs-bus-coresight-devices-tmc*

(Read) Similar to “trigger\_cntr” above except that this value is read directly from HW register TRG, 0x01C.

### **/sys/bus/coresight/devices/<memory\_map>.tmc/trigger\_cntr**

Defined on file *sysfs-bus-coresight-devices-tmc*

(RW) Disables write access to the Trace RAM by stopping the formatter after a defined number of words have been stored following the trigger event. Additional interface for this driver are expected to be added as it matures.

### **/sys/bus/coresight/devices/etm<N>/addr\_cmp\_view**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Print the current settings for the selected address comparator.

### **/sys/bus/coresight/devices/etm<N>/addr\_exlevel\_s\_ns**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Set the Exception Level matching bits for secure and non-secure exception levels.

### **/sys/bus/coresight/devices/etm<N>/addr\_idx**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Select which address comparator or pair (of comparators) to work with.

### **/sys/bus/coresight/devices/etm<N>/addr\_instdatatype**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls what type of comparison the trace unit performs.

### **/sys/bus/coresight/devices/etm<N>/addr\_range**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Used to setup address range comparator values.

### **/sys/bus/coresight/devices/etm<N>/addr\_single**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Used to setup single address comparator values.

---

### **/sys/bus/coresight/devices/etm<N>/bb\_ctrl**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls which regions in the memory map are enabled to use branch broadcasting.

---

### **/sys/bus/coresight/devices/etm<N>/cntr\_ctrl**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls the operation of the selected counter.

---

### **/sys/bus/coresight/devices/etm<N>/cntr\_idx**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Select which counter unit to work with.

---

### **/sys/bus/coresight/devices/etm<N>/cntr\_val**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) This sets or returns the current count value of the specific counter.

---

### **/sys/bus/coresight/devices/etm<N>/cntrldvr**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) This sets or returns the reload count value of the specific counter.

---

### **/sys/bus/coresight/devices/etm<N>/cpu**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) The CPU this tracing entity is associated with.

---

### **/sys/bus/coresight/devices/etm<N>/ctxid\_idx**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Select which context ID comparator to work with.

---

### **/sys/bus/coresight/devices/etm<N>/ctxid\_masks**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Mask for all 8 context ID comparator value registers (if implemented).

---

**/sys/bus/coresight/devices/etm<N>/ctxid\_pid**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Get/Set the context ID comparator value to trigger on.

---

**/sys/bus/coresight/devices/etm<N>/cyc\_threshold**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Sets the threshold value for cycle counting.

---

**/sys/bus/coresight/devices/etm<N>/enable\_source**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Enable/disable tracing on this specific trace entry. Enabling a source implies the source has been configured properly and a sink has been identified for it. The path of coresight components linking the source to the sink is configured and managed automatically by the coresight framework.

---

**/sys/bus/coresight/devices/etm<N>/event**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls the tracing of arbitrary events from bank 0 to 3.

---

**/sys/bus/coresight/devices/etm<N>/event\_instre**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls the behavior of the events in bank 0 to 3.

---

**/sys/bus/coresight/devices/etm<N>/event\_ts**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls the insertion of global timestamps in the trace streams.

---

**/sys/bus/coresight/devices/etm<N>/event\_vinst**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls instruction trace filtering.

---

### **/sys/bus/coresight/devices/etm<N>/mgmt/trcauthstatus**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Print the content of the Authentication Status Register (0xFB8). The value is taken directly from the HW.

---

### **/sys/bus/coresight/devices/etm<N>/mgmt/trcconfig**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Print the content of the trace configuration register (0x010) as currently set by SW.

---

### **/sys/bus/coresight/devices/etm<N>/mgmt/trcdevid**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Print the content of the Device ID Register (0xFC8). The value is taken directly from the HW.

---

### **/sys/bus/coresight/devices/etm<N>/mgmt/trcdevtype**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Print the content of the Device Type Register (0xFCC). The value is taken directly from the HW.

---

### **/sys/bus/coresight/devices/etm<N>/mgmt/trclsr**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Print the content of the SW Lock Status Register (0xFB4). The value is taken directly from the HW.

---

### **/sys/bus/coresight/devices/etm<N>/mgmt/trcoslsr**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Print the content of the OS Lock Status Register (0x304). The value is taken directly from the HW.

---

### **/sys/bus/coresight/devices/etm<N>/mgmt/trcpdcr**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Print the content of the Power Down Control Register (0x310). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/mgmt/trcpdsr**

---

Defined on file [sysfs-bus-coresight-devices-etm4x](#)

(Read) Print the content of the Power Down Status Register (0x314). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/mgmt/trcpidr0**

---

Defined on file [sysfs-bus-coresight-devices-etm4x](#)

(Read) Print the content of the Peripheral ID0 Register (0xFE0). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/mgmt/trcpidr1**

---

Defined on file [sysfs-bus-coresight-devices-etm4x](#)

(Read) Print the content of the Peripheral ID1 Register (0xFE4). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/mgmt/trcpidr2**

---

Defined on file [sysfs-bus-coresight-devices-etm4x](#)

(Read) Print the content of the Peripheral ID2 Register (0xFE8). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/mgmt/trcpidr3**

---

Defined on file [sysfs-bus-coresight-devices-etm4x](#)

(Read) Print the content of the Peripheral ID3 Register (0xFEC). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/mgmt/trctraceid**

---

Defined on file [sysfs-bus-coresight-devices-etm4x](#)

(Read) Print the content of the trace ID register (0x040).

---

**/sys/bus/coresight/devices/etm<N>/mode**

---

Defined on file [sysfs-bus-coresight-devices-etm4x](#)

(RW) Controls various modes supported by this ETM, for example P0 instruction tracing, branch broadcast, cycle counting and context ID tracing.

---

### **/sys/bus/coresight/devices/etm<N>/nr\_addr\_cmp**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Indicates the number of address comparator pairs that are available for tracing.

---

### **/sys/bus/coresight/devices/etm<N>/nr\_cntr**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Indicates the number of counters that are available for tracing.

---

### **/sys/bus/coresight/devices/etm<N>/nr\_ext\_inp**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Indicates how many external inputs are implemented.

---

### **/sys/bus/coresight/devices/etm<N>/nr\_pe\_cmp**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Indicates the number of PE comparator inputs that are available for tracing.

---

### **/sys/bus/coresight/devices/etm<N>/nr\_resource**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Indicates the number of resource selection pairs that are available for tracing.

---

### **/sys/bus/coresight/devices/etm<N>/nr\_ss\_cmp**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Indicates the number of single-shot comparator controls that are available for tracing.

---

### **/sys/bus/coresight/devices/etm<N>/nrseqstate**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Indicates the number of sequencer states that are implemented.

---

### **/sys/bus/coresight/devices/etm<N>/ns\_exlevel\_vinst**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) In non-secure state, each bit controls whether instruction tracing is enabled for the corresponding exception level.

---

**/sys/bus/coresight/devices/etm<N>/numcidc**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Indicates the number of Context ID comparators that are available for tracing.

---

**/sys/bus/coresight/devices/etm<N>/numvmidc**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Indicates the number of VMID comparators that are available for tracing.

---

**/sys/bus/coresight/devices/etm<N>/pe**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls which PE to trace.

---

**/sys/bus/coresight/devices/etm<N>/res\_ctrl**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls the selection of the resources in the trace unit.

---

**/sys/bus/coresight/devices/etm<N>/res\_idx**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Select which resource selection unit to work with.

---

**/sys/bus/coresight/devices/etm<N>/reset**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Write) Cancels all configuration on a trace unit and set it back to its boot configuration.

---

**/sys/bus/coresight/devices/etm<N>/s\_exlevel\_vinst**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) In Secure state, each bit controls whether instruction tracing is enabled for the corresponding exception level.

---

**/sys/bus/coresight/devices/etm<N>/seq\_event**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Moves the sequencer state to a specific state.

---

**/sys/bus/coresight/devices/etm<N>/seq\_idx**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Select which sequensor.

---

**/sys/bus/coresight/devices/etm<N>/seq\_reset\_event**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Moves the sequencer to state 0 when a programmed event occurs.

---

**/sys/bus/coresight/devices/etm<N>/seq\_state**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Use this to set, or read, the sequencer state.

---

**/sys/bus/coresight/devices/etm<N>/sshot\_ctrl**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Access the selected single shot control register.

---

**/sys/bus/coresight/devices/etm<N>/sshot\_idx**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Select the single shot control register to access.

---

**/sys/bus/coresight/devices/etm<N>/sshot\_pe\_ctrl**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Access the selected single show PE comparator control register.

---

**/sys/bus/coresight/devices/etm<N>/sshot\_status**

---

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Print the current value of the selected single shot status register.

### **/sys/bus/coresight/devices/etm<N>/syncfreq**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Controls how often trace synchronization requests occur.

### **/sys/bus/coresight/devices/etm<N>/trcidr/trcidr0**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the tracing capabilities of the trace unit (0x1E0). The value is taken directly from the HW.

### **/sys/bus/coresight/devices/etm<N>/trcidr/trcidr1**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the tracing capabilities of the trace unit (0x1E4). The value is taken directly from the HW.

### **/sys/bus/coresight/devices/etm<N>/trcidr/trcidr10**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the number of P1 right-hand keys that the trace unit can use (0x188). The value is taken directly from the HW.

### **/sys/bus/coresight/devices/etm<N>/trcidr/trcidr11**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the number of special P1 right-hand keys that the trace unit can use (0x18C). The value is taken directly from the HW.

### **/sys/bus/coresight/devices/etm<N>/trcidr/trcidr12**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the number of conditional P1 right-hand keys that the trace unit can use (0x190). The value is taken directly from the HW.

### **/sys/bus/coresight/devices/etm<N>/trcidr/trcidr13**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the number of special conditional P1 right-hand keys that the trace unit can use (0x194). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/trcidr/trcidr2**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the maximum size of the data value, data address, VMID, context ID and instruction address in the trace unit (0x1E8). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/trcidr/trcidr3**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the value associated with various resources available to the trace unit. See the Trace Macrocell architecture specification for more details (0x1E8). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/trcidr/trcidr4**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns how many resources the trace unit supports (0x1F0). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/trcidr/trcidr5**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns how many resources the trace unit supports (0x1F4). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/trcidr/trcidr8**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the maximum speculation depth of the instruction trace stream. (0x180). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/trcidr/trcidr9**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(Read) Returns the number of P0 right-hand keys that the trace unit can use (0x184). The value is taken directly from the HW.

---

**/sys/bus/coresight/devices/etm<N>/vinst\_pe\_cmp\_start\_stop**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Access the start stop control register for PE input comparators.

**/sys/bus/coresight/devices/etm<N>/vmid\_idx**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Select which virtual machine ID comparator to work with.

**/sys/bus/coresight/devices/etm<N>/vmid\_masks**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Mask for all 8 virtual machine ID comparator value registers (if implemented).

**/sys/bus/coresight/devices/etm<N>/vmid\_val**

Defined on file *sysfs-bus-coresight-devices-etm4x*

(RW) Get/Set the virtual machine ID comparator value to trigger on.

**/sys/bus/counter/devices/counterX/countY/ceiling**

Defined on file *sysfs-bus-counter*

Count value ceiling for Count Y. This is the upper limit for the respective counter.

**/sys/bus/counter/devices/counterX/countY/count**

Defined on file *sysfs-bus-counter*

Count data of Count Y represented as a string.

**/sys/bus/counter/devices/counterX/countY/count\_mode**

Defined on file *sysfs-bus-counter*

Count mode for channel Y. The ceiling and floor values for Count Y are used by the count mode where required. The following count modes are available:

**normal:**

Counting is continuous in either direction.

**range limit:**

An upper or lower limit is set, mimicking limit switches in the mechanical counterpart. The upper limit is set to the Count Y ceiling value, while the lower limit is set to the Count Y floor value. The counter freezes at count = ceiling when counting up, and at count = floor when counting down. At either of these limits, the counting is resumed only when the count direction is reversed.

**non-recycle:**

The counter is disabled whenever a counter overflow or underflow takes place. The counter is re-enabled when a new count value is loaded to the counter via a preset operation or direct write.

**modulo-n:**

A count value boundary is set between the Count Y floor value and the Count Y ceiling value. The counter is reset to the Count Y floor value at count = ceiling when counting up, while the counter is set to the Count Y ceiling value at count = floor when counting down; the counter does not freeze at the boundary points, but counts continuously throughout.

---

<code>/sys/bus/counter/devices/counterX/countY/count_mode_available</code>
<code>/sys/bus/counter/devices/counterX/countY/error_noise_available</code>
<code>/sys/bus/counter/devices/counterX/countY/function_available</code>
<code>/sys/bus/counter/devices/counterX/countY/signalZ_action_available</code>

---

Defined on file *sysfs-bus-counter*

Discrete set of available values for the respective Count Y configuration are listed in this file. Values are delimited by newline characters.

---

<code>/sys/bus/counter/devices/counterX/countY/direction</code>
---

---

Defined on file *sysfs-bus-counter*

Read-only attribute that indicates the count direction of Count Y. Two count directions are available: forward and backward.

Some counter devices are able to determine the direction of their counting. For example, quadrature encoding counters can determine the direction of movement by evaluating the leading phase of the respective A and B quadrature encoding signals. This attribute exposes such count directions.

---

<code>/sys/bus/counter/devices/counterX/countY/enable</code>
--

---

Defined on file *sysfs-bus-counter*

Whether channel Y counter is enabled. Valid attribute values are boolean.

This attribute is intended to serve as a pause/unpause mechanism for Count Y. Suppose a counter device is used to count the total movement of a conveyor belt: this attribute allows an operator to temporarily pause the counter, service the conveyor belt, and then finally unpause the counter to continue where it had left off.

---

<code>/sys/bus/counter/devices/counterX/countY/error_noise</code>
---

---

Defined on file *sysfs-bus-counter*

Read-only attribute that indicates whether excessive noise is present at the channel Y counter inputs.

### /sys/bus/counter/devices/counterX/countY/floor

Defined on file *sysfs-bus-counter*

Count value floor for Count Y. This is the lower limit for the respective counter.

### /sys/bus/counter/devices/counterX/countY/function

Defined on file *sysfs-bus-counter*

Count function mode of Count Y; count function evaluation is triggered by conditions specified by the Count Y signalZ\_action attributes. The following count functions are available:

**increase:**

Accumulated count is incremented.

**decrease:**

Accumulated count is decremented.

**pulse-direction:**

Rising edges on signal A updates the respective count. The input level of signal B determines direction.

**quadrature x1 a:**

If direction is forward, rising edges on quadrature pair signal A updates the respective count; if the direction is backward, falling edges on quadrature pair signal A updates the respective count. Quadrature encoding determines the direction.

**quadrature x1 b:**

If direction is forward, rising edges on quadrature pair signal B updates the respective count; if the direction is backward, falling edges on quadrature pair signal B updates the respective count. Quadrature encoding determines the direction.

**quadrature x2 a:**

Any state transition on quadrature pair signal A updates the respective count. Quadrature encoding determines the direction.

**quadrature x2 b:**

Any state transition on quadrature pair signal B updates the respective count. Quadrature encoding determines the direction.

**quadrature x4:**

Any state transition on either quadrature pair signals updates the respective count. Quadrature encoding determines the direction.

### /sys/bus/counter/devices/counterX/countY/name

Defined on file *sysfs-bus-counter*

Read-only attribute that indicates the device-specific name of Count Y. If possible, this should match the name of the respective channel as it appears in the device datasheet.

---

**/sys/bus/counter/devices/counterX/countY/prescaler**

---

Defined on file [sysfs-bus-counter-ftm-quaddec](#)

Configure the prescaler value associated with Count Y. On the FlexTimer, the counter clock source passes through a prescaler (i.e. a counter). This acts like a clock divider.

---

**/sys/bus/counter/devices/counterX/countY/prescaler\_available**

---

Defined on file [sysfs-bus-counter-ftm-quaddec](#)

Discrete set of available values for the respective Count Y configuration are listed in this file. Values are delimited by newline characters.

---

**/sys/bus/counter/devices/counterX/countY/preset**

---

Defined on file [sysfs-bus-counter](#)

If the counter device supports preset registers – registers used to load counter channels to a set count upon device-defined preset operation trigger events – the preset count for channel Y is provided by this attribute.

---

**/sys/bus/counter/devices/counterX/countY/preset\_enable**

---

Defined on file [sysfs-bus-counter](#)

Whether channel Y counter preset operation is enabled. Valid attribute values are boolean.

---

**/sys/bus/counter/devices/counterX/countY/signalZ\_action**

---

Defined on file [sysfs-bus-counter](#)

Action mode of Count Y for Signal Z. This attribute indicates the condition of Signal Z that triggers the count function evaluation for Count Y. The following action modes are available:

**none:**

Signal does not trigger the count function. In Pulse-Direction count function mode, this Signal is evaluated as Direction.

**rising edge:**

Low state transitions to high state.

**falling edge:**

High state transitions to low state.

### **both edges:**

Any state transition.

---

### **/sys/bus/counter/devices/counterX/name**

---

Defined on file *sysfs-bus-counter*

Read-only attribute that indicates the device-specific name of the Counter. This should match the name of the device as it appears in its respective datasheet.

---

### **/sys/bus/counter/devices/counterX/num\_counts**

---

Defined on file *sysfs-bus-counter*

Read-only attribute that indicates the total number of Counts belonging to the Counter.

---

### **/sys/bus/counter/devices/counterX/num\_signals**

---

Defined on file *sysfs-bus-counter*

Read-only attribute that indicates the total number of Signals belonging to the Counter.

---

### **/sys/bus/counter/devices/counterX/signalY/cable\_fault**

---

Defined on file *sysfs-bus-counter-104-quad-8*

Read-only attribute that indicates whether a differential encoder cable fault (not connected or loose wires) is detected for the respective channel of Signal Y. Valid attribute values are boolean. Detection must first be enabled via the corresponding cable\_fault\_enable attribute.

---

### **/sys/bus/counter/devices/counterX/signalY/cable\_fault\_enable**

---

Defined on file *sysfs-bus-counter-104-quad-8*

Whether detection of differential encoder cable faults for the respective channel of Signal Y is enabled. Valid attribute values are boolean.

---

### **/sys/bus/counter/devices/counterX/signalY/filter\_clock\_prescaler**

---

Defined on file *sysfs-bus-counter-104-quad-8*

Filter clock factor for input Signal Y. This prescaler value affects the inputs of both quadrature pair signals.

---

### **/sys/bus/counter/devices/counterX/signalY/index\_polarity**

---

Defined on file [sysfs-bus-counter-104-quad-8](#)

Active level of index input Signal Y; irrelevant in non-synchronous load mode.

---

**/sys/bus/counter/devices/counterX/signalY/index\_polarity\_available**  
**/sys/bus/counter/devices/counterX/signalY/synchronous\_mode\_available**

---

Defined on file [sysfs-bus-counter-104-quad-8](#)

Discrete set of available values for the respective Signal Y configuration are listed in this file.

---

**/sys/bus/counter/devices/counterX/signalY/name**

---

Defined on file [sysfs-bus-counter](#)

Read-only attribute that indicates the device-specific name of Signal Y. If possible, this should match the name of the respective signal as it appears in the device datasheet.

---

**/sys/bus/counter/devices/counterX/signalY/signal**

---

Defined on file [sysfs-bus-counter](#)

Signal data of Signal Y represented as a string.

---

**/sys/bus/counter/devices/counterX/signalY/synchronous\_mode**

---

Defined on file [sysfs-bus-counter-104-quad-8](#)

Configure the counter associated with Signal Y for non-synchronous or synchronous load mode. Synchronous load mode cannot be selected in non-quadrature (Pulse-Direction) clock mode.

**non-synchronous:**

A logic low level is the active level at this index input. The index function (as enabled via preset\_enable) is performed directly on the active level of the index input.

**synchronous:**

Intended for interfacing with encoder Index output in quadrature clock mode. The active level is configured via index\_polarity. The index function (as enabled via preset\_enable) is performed synchronously with the quadrature clock on the active level of the index input.

---

**/sys/bus/css/devices/…/driver\_override**

---

Defined on file [sysfs-bus-css](#)

This file allows the driver for a device to be specified. When specified, only a driver with a name matching the value written to driver\_override will have an

opportunity to bind to the device. The override is specified by writing a string to the driver\_override file (`echo vfio-ccw > driver_override`) and may be cleared with an empty string (`echo > driver_override`). This returns the device to standard matching rules binding. Writing to driver\_override does not automatically unbind the device from its current driver or make any attempt to automatically load the specified driver. If no driver with a matching name is currently loaded in the kernel, the device will not bind to any driver. This also allows devices to opt-out of driver binding using a driver\_override name such as “none”. Only a single driver may be specified in the override, there is no support for parsing delimiters.

Note that unlike the mechanism of the same name for pci, this file does not allow to override basic matching rules. I.e., the driver must still match the subchannel type of the device.

### **/sys/bus/css/devices/…/modalias**

Defined on file *sysfs-bus-css*

Contains the module alias as reported with uevents. It is of the format `css:t<type>` and present for all subchannel types.

### **/sys/bus/css/devices/…/type**

Defined on file *sysfs-bus-css*

Contains the subchannel type, as reported by the hardware. This attribute is present for all subchannel types.

### **/sys/bus/css/drivers/io\_subchannel/…/chpids**

Defined on file *sysfs-bus-css*

Contains the ids of the channel paths used by this subchannel, as reported by the channel subsystem during subchannel recognition.

Note: This is an I/O-subchannel specific attribute.

Users: s390-tools, HAL

### **/sys/bus/css/drivers/io\_subchannel/…/pimpampom**

Defined on file *sysfs-bus-css*

Contains the PIM/PAM/POM values, as reported by the channel subsystem when last queried by the common I/O layer (this implies that this attribute is not necessarily in sync with the values current in the channel subsystem).

Note: This is an I/O-subchannel specific attribute.

Users: s390-tools, HAL

### **/sys/bus/dfl/devices/dfl\_dev.X/feature\_id**

Defined on file *sysfs-bus-dfl*

Read-only. It returns feature identifier local to its DFL FIU type.

Format: 0x%x

**/sys/bus/dfl/devices/dfl\_dev.X/type**

Defined on file *sysfs-bus-dfl*

Read-only. It returns type of DFL FIU of the device. Now DFL supports 2 FIU types, 0 for FME, 1 for PORT.

Format: 0x%x

**/sys/bus/drivers/corsair/<dev>/current\_profile**

Defined on file *sysfs-driver-hid-corsair*

Get/set the current selected profile. Values are from 1 to 3.

**/sys/bus/drivers/corsair/<dev>/macro\_mode**

Defined on file *sysfs-driver-hid-corsair*

Get/set the current playback mode. “SW” for software mode where G-keys triggers their regular key codes. “HW” for hardware playback mode where the G-keys play their macro from the on-board memory.

**/sys/bus/event\_source/devices/<dev>/format**

Defined on file *sysfs-bus-event\_source-devices-format*

Attribute group to describe the magic bits that go into perf\_event\_attr::config[012] for a particular pmu. Each attribute of this group defines the ‘hardware’ bitmask we want to export, so that userspace can deal with sane name/value pairs.

Userspace must be prepared for the possibility that attributes define overlapping bit ranges. For example:

```
attr1 = 'config:0-23'
attr2 = 'config:0-7'
attr3 = 'config:12-35'
```

Example: ‘config1:1,6-10,44’ Defines contents of attribute that occupies bits 1,6-10,44 of perf\_event\_attr::config1.

**/sys/bus/event\_source/devices/<pmu>/events/<event>**

Defined on file *sysfs-bus-event\_source-devices-events*

Per-pmu performance monitoring events specific to the running system

Each file (except for some of those with a ‘.’ in them, ‘.unit’ and ‘.scale’ ) in the ‘events’ directory describes a single performance monitoring event supported by the <pmu>. The name of the file is the name of the event.

File contents:

```
<term>[=<value>][,<term>[=<value>]]…
```

Where <term> is one of the terms listed under /sys/bus/event\_source/devices/<pmu>/format/ and <value> is a number in base-16 format with a ‘0x’ prefix (lowercase only). If a <term> is specified alone (without an assigned value), it is implied that 0x1 is assigned to that <term>.

Examples (each of these lines would be in a separate file):

event=0x2abc	event=0x423,inv,cmask=0x3	do-
main=0x1,offset=0x8,starting_index=0xffff		do-
main=0x1,offset=0x8,core=?		

Each of the assignments indicates a value to be assigned to a particular set of bits (as defined by the format file corresponding to the <term>) in the perf\_event structure passed to the perf\_open syscall.

In the case of the last example, a value replacing “?” would need to be provided by the user selecting the particular event. This is referred to as “event parameterization”. Event parameters have the format ‘param=?’ .

---

### /sys/bus/event\_source/devices/<pmu>/events/<event>.scale

---

Defined on file *sysfs-bus-event\_source-devices-events*

Perf event scaling factors

A string representing a floating point value expressed in scientific notation to be multiplied by the event count received from the kernel to match the unit specified in the <event>.unit file.

Example:

```
2.3283064365386962890625e-10
```

This is provided to avoid performing floating point arithmetic in the kernel.

---

### /sys/bus/event\_source/devices/<pmu>/events/<event>.unit

---

Defined on file *sysfs-bus-event\_source-devices-events*

Perf event units

A string specifying the English plural numerical unit that <event> (once multiplied by <event>.scale) represents.

Example:

```
Joules
```

---

### /sys/bus/event\_source/devices/dfl\_fmeX/cpumask

---

Defined on file [sysfs-bus-event\\_source-devices-dfl\\_fme](#)

Read-only. This file always returns cpu which the PMU is bound for access to all fme pmu performance monitoring events.

### **/sys/bus/event\_source/devices/dfl\_fmeX/events**

Defined on file [sysfs-bus-event\\_source-devices-dfl\\_fme](#)

Read-only. Attribute group to describe performance monitoring events specific to fme. Each attribute in this group describes a single performance monitoring event supported by this fme pmu. The name of the file is the name of the event. (See ABI/testing/sysfs-bus-event\_source-devices-events).

All supported performance monitoring events are listed below.

Basic events (evtype=0x00):

```
clock = "event=0x00,evtype=0x00,portid=0xff"
```

Cache events (evtype=0x01):

```
cache_read_hit      = "event=0x00,evtype=0x01,portid=0xff"
cache_read_miss    = "event=0x01,evtype=0x01,portid=0xff"
cache_write_hit    = "event=0x02,evtype=0x01,portid=0xff"
cache_write_miss   = "event=0x03,evtype=0x01,portid=0xff"
cache_hold_request = "event=0x05,evtype=0x01,portid=0xff"
cache_data_write_port_contention =
                     "event=0x06,evtype=0x01,portid=0xff"
cache_tag_write_port_contention =
                     "event=0x07,evtype=0x01,portid=0xff"
cache_tx_req_stall = "event=0x08,evtype=0x01,portid=0xff"
cache_rx_req_stall = "event=0x09,evtype=0x01,portid=0xff"
cache_eviction     = "event=0xa,evtype=0x01,portid=0xff"
```

Fabric events (evtype=0x02):

```
fab_pcie0_read      = "event=0x00,evtype=0x02,portid=0xff"
fab_pcie0_write     = "event=0x01,evtype=0x02,portid=0xff"
fab_pcie1_read      = "event=0x02,evtype=0x02,portid=0xff"
fab_pcie1_write     = "event=0x03,evtype=0x02,portid=0xff"
fab_upi_read        = "event=0x04,evtype=0x02,portid=0xff"
fab_upi_write       = "event=0x05,evtype=0x02,portid=0xff"
fab_mmio_read       = "event=0x06,evtype=0x02,portid=0xff"
fab_mmio_write      = "event=0x07,evtype=0x02,portid=0xff"
fab_port_pcie0_read = "event=0x00,evtype=0x02,portid=?"
fab_port_pcie0_write = "event=0x01,evtype=0x02,portid=?"
fab_port_pcie1_read = "event=0x02,evtype=0x02,portid=?"
fab_port_pcie1_write = "event=0x03,evtype=0x02,portid=?"
fab_port_upi_read   = "event=0x04,evtype=0x02,portid=?"
fab_port_upi_write  = "event=0x05,evtype=0x02,portid=?"
fab_port_mmio_read  = "event=0x06,evtype=0x02,portid=?"
fab_port_mmio_write = "event=0x07,evtype=0x02,portid=?"
```

VTD events (evtype=0x03):

```
vtd_port_read_transaction = "event=0x00,evtype=0x03,portid=?"
vtd_port_write_transaction = "event=0x01,evtype=0x03,portid=?"
vtd_port_devtlb_read_hit = "event=0x02,evtype=0x03,portid=?"
vtd_port_devtlb_write_hit = "event=0x03,evtype=0x03,portid=?"
vtd_port_devtlb_4k_fill = "event=0x04,evtype=0x03,portid=?"
vtd_port_devtlb_2m_fill = "event=0x05,evtype=0x03,portid=?"
vtd_port_devtlb_1g_fill = "event=0x06,evtype=0x03,portid=?"
```

VTD SIP events (evtype=0x04):

```
vtd_sip_iotlb_4k_hit = "event=0x00,evtype=0x04,portid=0xff"
vtd_sip_iotlb_2m_hit = "event=0x01,evtype=0x04,portid=0xff"
vtd_sip_iotlb_1g_hit = "event=0x02,evtype=0x04,portid=0xff"
vtd_sip_slpwc_l3_hit = "event=0x03,evtype=0x04,portid=0xff"
vtd_sip_slpwc_l4_hit = "event=0x04,evtype=0x04,portid=0xff"
vtd_sip_rcc_hit = "event=0x05,evtype=0x04,portid=0xff"
vtd_sip_iotlb_4k_miss = "event=0x06,evtype=0x04,portid=0xff"
vtd_sip_iotlb_2m_miss = "event=0x07,evtype=0x04,portid=0xff"
vtd_sip_iotlb_1g_miss = "event=0x08,evtype=0x04,portid=0xff"
vtd_sip_slpwc_l3_miss = "event=0x09,evtype=0x04,portid=0xff"
vtd_sip_slpwc_l4_miss = "event=0x0a,evtype=0x04,portid=0xff"
vtd_sip_rcc_miss = "event=0x0b,evtype=0x04,portid=0xff"
```

### **/sys/bus/event\_source/devices/dfl\_fmeX/format**

Defined on file [sysfs-bus-event\\_source-devices-dfl\\_fme](#)

Read-only. Attribute group to describe the magic bits that go into perf\_event\_attr.config for a particular pmu. (See ABI/testing/sysfs-bus-event\_source-devices-format).

Each attribute under this group defines a bit range of the perf\_event\_attr.config. All supported attributes are listed below:

```
event = "config:0-11" - event ID
evtype = "config:12-15" - event type
portid = "config:16-23" - event source
```

For example:

```
fab_mmio_read = "event=0x06,evtype=0x02,portid=0xff"
```

It shows this fab\_mmio\_read is a fabric type (0x02) event with 0x06 local event id for overall monitoring (portid=0xff).

### **/sys/bus/event\_source/devices/hv\_24x7/event\_descs/<event-name>**

Defined on file [sysfs-bus-event\\_source-devices-hv\\_24x7](#)

Provides the description of a particular event as provided by the firmware. If firmware does not provide a description, no file will be created.

Note that the event-name lacks the domain suffix appended for events in the events/ dir.

### **/sys/bus/event\_source/devices/hv\_24x7/event\_long\_descs/<event-name>**

Defined on file *sysfs-bus-event\_source-devices-hv\_24x7*

Provides the “long” description of a particular event as provided by the firmware. If firmware does not provide a description, no file will be created.

Note that the event-name lacks the domain suffix appended for events in the events/ dir.

### **/sys/bus/event\_source/devices/hv\_24x7/format**

Defined on file *sysfs-bus-event\_source-devices-hv\_24x7*

Read-only. Attribute group to describe the magic bits that go into perf\_event\_attr.config for a particular pmu. (See ABI/testing/sysfs-bus-event\_source-devices-format).

Each attribute under this group defines a bit range of the perf\_event\_attr.config. All supported attributes are listed below:

```
chip = "config:16-31"
core  = "config:16-31"
domain = "config:0-3"
lpar  = "config:0-15"
offset = "config:32-63"
vcpu  = "config:16-31"
```

For example:

```
PM_PB_CYC = "domain=1,offset=0x80,chip=? ,lpar=0x0"
```

In this event, ‘?’ after chip specifies that this value will be provided by user while running this event.

### **/sys/bus/event\_source/devices/hv\_24x7/interface/catalog**

Defined on file *sysfs-bus-event\_source-devices-hv\_24x7*

Provides access to the binary “24x7 catalog” provided by the hypervisor on POWER7 and 8 systems. This catalog lists events available from the powerpc “hv\_24x7” pmu. Its format is documented here: <https://raw.githubusercontent.com/jmesmon/catalog-24x7/master/hv-24x7-catalog.h>

### **/sys/bus/event\_source/devices/hv\_24x7/interface/catalog\_length**

Defined on file *sysfs-bus-event\_source-devices-hv\_24x7*

A number equal to the length in bytes of the catalog. This is also extractable from the provided binary “catalog” sysfs entry.

### **/sys/bus/event\_source/devices/hv\_24x7/interface/catalog\_version**

Defined on file *sysfs-bus-event\_source-devices-hv\_24x7*

Expose the “version” field of the 24x7 catalog. This is also extractable from the provided binary “catalog” sysfs entry.

### **/sys/bus/event\_source/devices/hv\_gpci/format**

Defined on file *sysfs-bus-event\_source-devices-hv\_gpci*

Read-only. Attribute group to describe the magic bits that go into perf\_event\_attr.config for a particular pmu. (See ABI/testing/sysfs-bus-event\_source-devices-format).

Each attribute under this group defines a bit range of the perf\_event\_attr.config. All supported attributes are listed below:

```
counter_info_version = "config:16-23"
length = "config:24-31"
partition_id = "config:32-63"
request = "config:0-31"
sibling_part_id = "config:32-63"
hw_chip_id = "config:32-63"
offset = "config:32-63"
phys_processor_idx = "config:32-63"
secondary_index = "config:0-15"
starting_index = "config:32-63"
```

For example:

```
processor_core_utilization_instructions_completed = "request=0x94,
                                                    phys_processor_idx=?,
                                                    counter_info_version=0x8,
                                                    length=8,
                                                    offset=0x18"
```

In this event, ‘?’ after phys\_processor\_idx specifies this value this value will be provided by user while running this event.

### **/sys/bus/event\_source/devices/hv\_gpci/interface/collect\_privileged**

Defined on file *sysfs-bus-event\_source-devices-hv\_gpci*

‘0’ if the hypervisor is configured to forbid access to event counters being accumulated by other guests and to physical domain event counters.

‘1’ if that access is allowed.

---

**/sys/bus/event\_source/devices/hv\_gpci/interface/expanded**

Defined on file *sysfs-bus-event\_source-devices-hv\_gpci*

0 or 1. Indicates whether we have access to “EXPANDED” events (listed in arch/powerpc/perf/hv-gpci.h).

---

**/sys/bus/event\_source/devices/hv\_gpci/interface/ga**

Defined on file *sysfs-bus-event\_source-devices-hv\_gpci*

0 or 1. Indicates whether we have access to “GA” events (listed in arch/powerpc/perf/hv-gpci.h).

---

**/sys/bus/event\_source/devices/hv\_gpci/interface/kernel\_version**

Defined on file *sysfs-bus-event\_source-devices-hv\_gpci*

A number indicating the latest version of the gpci interface that the kernel is aware of.

---

**/sys/bus/event\_source/devices/hv\_gpci/interface/lab**

Defined on file *sysfs-bus-event\_source-devices-hv\_gpci*

0 or 1. Indicates whether we have access to “LAB” events (listed in arch/powerpc/perf/hv-gpci.h).

---

**/sys/bus/event\_source/devices/hv\_gpci/interface/version**

Defined on file *sysfs-bus-event\_source-devices-hv\_gpci*

A number indicating the version of the gpci interface that the hypervisor reports supporting.

---

**/sys/bus/fcoe/**

Defined on file *sysfs-bus-fcoe*

The FCoE bus. Attributes in this directory are control interfaces.

Attributes:

**ctlr\_create:**

‘FCoE Controller’ instance creation interface. Writing an <ifname> to this file will allocate and populate sysfs with a fcoe\_ctrl\_device (ctlr\_X). The user can then configure any per-port settings and finally write to the fcoe\_ctrl\_device’s ‘start’ attribute to begin the kernel’s discovery and login process.

**ctlr\_destroy:**

'FCoE Controller' instance removal interface. Writing a fcoe\_ctrlr\_device's sysfs name to this file will log the fcoe\_ctrlr\_device out of the fabric or otherwise connected FCoE devices. It will also free all kernel memory allocated for this fcoe\_ctrlr\_device and any structures associated with it, this includes the scsi\_host.

**/sys/bus/fcoe/devices/ctlr\_X**

Defined on file [sysfs-bus-fcoe](#)

'FCoE Controller' instances on the fcoe bus. The FCoE Controller now has a three stage creation process. 1) Write interface name to ctlr\_create 2) Configure the FCoE Controller (ctlr\_X) 3) Enable the FCoE Controller to begin discovery and login. The FCoE Controller is destroyed by writing it's name, i.e. ctlr\_X to the ctlr\_delete file.

Attributes:

**fcf\_dev\_loss\_tmo:**

Device loss timeout period (see below). Changing this value will change the dev\_loss\_tmo for all FCFs discovered by this controller.

**mode:**

Display or change the FCoE Controller's mode. Possible modes are 'Fabric' and 'VN2VN'. If a FCoE Controller is started in 'Fabric' mode then FIP FCF discovery is initiated and ultimately a fabric login is attempted. If a FCoE Controller is started in 'VN2VN' mode then FIP VN2VN discovery and login is performed. A FCoE Controller only supports one mode at a time.

**enabled:**

Whether an FCoE controller is enabled or disabled. 0 if disabled, 1 if enabled. Writing either 0 or 1 to this file will enable or disable the FCoE controller.

**lesb/link\_fail:**

Link Error Status Block (LESB) link failure count.

**lesb/vlink\_fail:**

Link Error Status Block (LESB) virtual link failure count.

**lesb/miss\_fka:**

Link Error Status Block (LESB) missed FCoE Initialization Protocol (FIP) Keep-Alives (FKA).

**lesb/symb\_err:**

Link Error Status Block (LESB) symbolic error count.

**lesb/err\_block:**

Link Error Status Block (LESB) block error count.

**lesb/fcs\_error:**

Link Error Status Block (LESB) Fibre Channel Services error count.

Notes: ctlr\_X (global increment starting at 0)

---

**/sys/bus/fcoe/devices/fcf\_X**

Defined on file [sysfs-bus-fcoe](#)

‘FCoE FCF’ instances on the fcoe bus. A FCF is a Fibre Channel Forwarder, which is a FCoE switch that can accept FCoE (Ethernet) packets, unpack them, and forward the embedded Fibre Channel frames into a FC fabric. It can also take outbound FC frames and pack them in Ethernet packets to be sent to their destination on the Ethernet segment.

Attributes:

**fabric\_name:**

Identifies the fabric that the FCF services.

**switch\_name:**

Identifies the FCF.

**priority:**

The switch’ s priority amongst other FCFs on the same fabric.

**selected:**

1 indicates that the switch has been selected for use; 0 indicates that the switch will not be used.

**fc\_map:**

The Fibre Channel MAP

**vfid:**

The Virtual Fabric ID

**mac:**

The FCF’ s MAC address

**fka\_period:**

The FIP Keep-Alive period

**fabric\_state:** The internal kernel state

- “Unknown” - Initialization value
- “Disconnected” - No link to the FCF/fabric
- “Connected” - Host is connected to the FCF
- “Deleted” - FCF is being removed from the system

**dev\_loss\_tmo:** The device loss timeout period for this FCF.

**Notes: A device loss infrastructure similar to the FC Transport’ s**

is present in fcoe\_sysfs. It is nice to have so that a link flapping adapter doesn’ t continually advance the count used to identify the discovered FCF. FCFs will exist in a “Disconnected” state until either the timer expires and the FCF becomes “Deleted” or the FCF is rediscovered and becomes “Connected.”

**Users:** The first user of this interface will be the fcoeadm application, which is commonly packaged in the fcoe-utils package.

### /sys/bus/fsl-mc/drivers/…/bind

Defined on file *sysfs-bus-fsl-mc*

Writing a device location to this file will cause the driver to attempt to bind to the device found at this location. The format for the location is Object.Id and is the same as found in /sys/bus/fsl-mc/devices/.

For example:

```
# echo dpni.2 > /sys/bus/fsl-mc/drivers/fsl_dpaa2_eth/bind
```

### /sys/bus/fsl-mc/drivers/…/unbind

Defined on file *sysfs-bus-fsl-mc*

Writing a device location to this file will cause the driver to attempt to unbind from the device found at this location. The format for the location is Object.Id and is the same as found in /sys/bus/fsl-mc/devices/.

For example:

```
# echo dpni.2 > /sys/bus/fsl-mc/drivers/fsl_dpaa2_eth/unbind
```

### /sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/speed

Defined on file *sysfs-driver-wacom*

The /sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/speed file controls reporting speed of Wacom bluetooth tablet. Reading from this file returns 1 if tablet reports in high speed mode or 0 otherwise. Writing to this file one of these values switches reporting speed.

### /sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom\_led/button<n>\_rawimg

Defined on file *sysfs-driver-wacom*

When writing a 1024 byte raw image in Wacom Intuos 4 interleaving format to the file, the image shows up on Button N of the device. The image is a 64x32 pixel 4-bit gray image. The 1024 byte binary is split up into 16x 64 byte chunks. Each 64 byte chunk encodes the image data for two consecutive lines on the display. The low nibble of each byte contains the first line, and the high nibble contains the second line. When the Wacom Intuos 4 is connected over Bluetooth, the image has to contain 256 bytes (64x32 px 1 bit colour). The format is also scrambled, like in the USB mode, and it can be summarized by converting:

```
76543210 into GECA6420.  
HGFEDCBA      HFDB7531
```

---

**/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom\_led/buttons\_luminance**

---

Defined on file *sysfs-driver-wacom*

Writing to this file sets the overall luminance level (0..15) of all eight button OLED displays.

---

**/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom\_led/led**

---

Defined on file *sysfs-driver-wacom*

Attribute group for control of the status LEDs and the OLEDs. This attribute group is only available for Intuos 4 M, L, and XL (with LEDs and OLEDs), Intuos 4 WL, Intuos 5 (LEDs only), Intuos Pro (LEDs only) and Cintiq 21UX2 and Cintiq 24HD (LEDs only). Therefore its presence implicitly signifies the presence of said LEDs and OLEDs on the tablet device.

---

**/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom\_led/status0\_luminance**

---

Defined on file *sysfs-driver-wacom*

<obsoleted by the LED class API now exported by the driver> Writing to this file sets the status LED luminance (1..127) when the stylus does not touch the tablet surface, and no button is pressed on the stylus. This luminance level is normally lower than the level when a button is pressed.

---

**/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom\_led/status1\_luminance**

---

Defined on file *sysfs-driver-wacom*

<obsoleted by the LED class API now exported by the driver> Writing to this file sets the status LED luminance (1..127) when the stylus touches the tablet surface, or any button is pressed on the stylus.

---

**/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom\_led/status\_led0\_select**

---

Defined on file *sysfs-driver-wacom*

<obsoleted by the LED class API now exported by the driver> Writing to this file sets which one of the four (for Intuos 4 and Intuos 5) or of the right four (for Cintiq 21UX2 and Cintiq 24HD) status LEDs is active (0..3). The other three LEDs on the same side are always inactive.

---

**/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom\_led/status\_led1\_select**

---

Defined on file *sysfs-driver-wacom*

<obsoleted by the LED class API now exported by the driver> Writing to this file sets which one of the left four (for Cintiq 21UX2 and Cintiq 24HD) status LEDs is active (0..3). The other three LEDs on the left are always inactive.

---

### /sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom\_remote/<serial\_number>/remo

---

Defined on file *sysfs-driver-wacom*

<obsoleted by the LED class API now exported by the driver> Reading from this file reports the mode status of the remote as indicated by the LED lights on the device. If no reports have been received from the paired device, reading from this file will report ‘-1’ . The mode is read-only and cannot be set through the driver.

---

### /sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom\_remote/unpair\_remote

---

Defined on file *sysfs-driver-wacom*

Writing the character sequence ‘\*’ followed by a newline to this file will delete all of the current pairings on the device. Other character sequences are reserved. This file is write only.

---

### /sys/bus/hid/drivers/logitech-hidpp-device/<dev>/builtin\_power\_supply

---

Defined on file *sysfs-driver-hid-logitech-hidpp*

Presence of this file indicates that HID++ driver is capable of handling battery properties in the kernel. This way, upower can add a udev rule to decide whether or not it should use the internal unifying support or the generic kernel one.

---

### /sys/bus/hid/drivers/logitech-hidpp-device/<dev>/range

---

Defined on file *sysfs-driver-hid-logitech-hidpp*

(RW) This attribute controls the amount of ‘turn’ permitted in Logitech G920 wheel. Reading from the file shows the current range of the steering wheel. Writing a value within the min and max boundary sets the range of the wheel.

---

### /sys/bus/hid/drivers/logitech/<dev>/alternate\_modes

---

Defined on file *sysfs-driver-hid-logitech-lg4ff*

Displays a set of alternate modes supported by a wheel. Each mode is listed as follows:

Tag: Mode Name

Currently active mode is marked with an asterisk. List also contains an abstract item “native” which always denotes the native mode of the wheel. Echoing the mode tag switches the wheel into the corresponding mode. Depending on the exact model of the wheel not all listed modes might always be selectable. If a wheel

cannot be switched into the desired mode, -EINVAL is returned accompanied with an explanatory message in the kernel log. This entry is not created for devices that have only one mode.

Currently supported mode switches:

Driving Force Pro:

**DF-EX --> DFP**

G25:

**DF-EX --> DFP --> G25**

G27:

**DF-EX <\*> DFP <-> G25 <-> G27**  
**DF-EX <\*-----> G25 <-> G27**  
**DF-EX <\*-----> G27**

G29:

**DF-EX <\*> DFP <-> G25 <-> G27 <-> G29**  
**DF-EX <\*-----> G25 <-> G27 <-> G29**  
**DF-EX <\*-----> G27 <-> G29**  
**DF-EX <\*-----> G29**

DFGT:

**DF-EX <\*> DFP <-> DFGT**  
**DF-EX <\*-----> DFGT**

- hid\_logitech module must be loaded with lg4ff\_no\_autoswitch=1 parameter set in order for the switch to DF-EX mode to work.

---

**/sys/bus/hid/drivers/logitech/<dev>/combine\_pedals**

Defined on file *sysfs-driver-hid-logitech-lg4ff*

Controls whether a combined value of accelerator and brake is reported on the Y axis of the controller. Useful for older games which can do not work with separate accelerator/brake axis. Off ( ‘0’ ) by default, enabled by setting ‘1’ .

---

**/sys/bus/hid/drivers/logitech/<dev>/range**

Defined on file *sysfs-driver-hid-logitech-lg4ff*

Display minimum, maximum and current range of the steering wheel. Writing a value within min and max boundaries sets the range of the wheel.

---

**/sys/bus/hid/drivers/logitech/<dev>/real\_id**

Defined on file [sysfs-driver-hid-logitech-lg4ff](#)

Displays the real model of the wheel regardless of any alternate mode the wheel might be switched to. It is a read-only value. This entry is not created for devices that have only one mode.

**/sys/bus/hid/drivers/ntrig/<dev>/activate\_slack**

Defined on file [sysfs-driver-hid-ntrig](#)

(RW) Number of contact frames ignored before acknowledging the start of activity (activating touch).

**/sys/bus/hid/drivers/ntrig/<dev>/activation\_width**  
**/sys/bus/hid/drivers/ntrig/<dev>/activation\_height**

Defined on file [sysfs-driver-hid-ntrig](#)

Thresholds to override activation slack.

activation_width	(RW) Width threshold to immediately start processing touch events.
activation_height	(RW) Height threshold to immediately start processing touch events.

**/sys/bus/hid/drivers/ntrig/<dev>/deactivate\_slack**

Defined on file [sysfs-driver-hid-ntrig](#)

(RW) Number of empty (no contact) frames ignored before acknowledging the end of activity (deactivating touch).

When the last finger is removed from the device, it sends a number of empty frames. By holding off on deactivation for a few frames false erroneous disconnects can be tolerated, where the sensor may mistakenly not detect a finger that is still present.

**/sys/bus/hid/drivers/ntrig/<dev>/min\_width**  
**/sys/bus/hid/drivers/ntrig/<dev>/min\_height**

Defined on file [sysfs-driver-hid-ntrig](#)

Minimum size contact accepted.

min_width	(RW) Minimum touch contact width to decide activation and activity.
min_height	(RW) Minimum touch contact height to decide activation and activity.

---

**/sys/bus/hid/drivers/ntrig/<dev>/sensor\_logical\_width  
/sys/bus/hid/drivers/ntrig/<dev>/sensor\_logical\_height**

---

Defined on file *sysfs-driver-hid-ntrig*

(RO) The range for positions reported during activity.

---

**/sys/bus/hid/drivers/ntrig/<dev>/sensor\_physical\_width  
/sys/bus/hid/drivers/ntrig/<dev>/sensor\_physical\_height**

---

Defined on file *sysfs-driver-hid-ntrig*

(RO) These are internal ranges not used for normal events but useful for tuning.

---

**/sys/bus/hid/drivers/prodikeys/…/channel**

---

Defined on file *sysfs-driver-hid-prodikeys*

Allows control (via software) the midi channel to which that pc-midi keyboard will output.midi data. Range: 0..15 Type: Read/write

---

**/sys/bus/hid/drivers/prodikeys/…/octave**

---

Defined on file *sysfs-driver-hid-prodikeys*

Controls the octave shift modifier in the pc-midi driver. The octave can be shifted via software up/down 2 octaves. 0 means the no octave shift. Range: -2..2 (minus 2 to plus 2) Type: Read/Write

---

**/sys/bus/hid/drivers/prodikeys/…/sustain**

---

Defined on file *sysfs-driver-hid-prodikeys*

Allows control (via software) the sustain duration of a note held by the pc-midi driver. 0 means sustain mode is disabled. Range: 0..5000 (milliseconds) Type: Read/write

---

**/sys/bus/hid/drivers/wiimote/<dev>/bboard\_calib**

---

Defined on file *sysfs-driver-hid-wiimote*

This attribute is only provided if the device was detected as a balance board. It provides a single line with 3 calibration values for all 4 sensors. The values are separated by colons and are each 2 bytes long (encoded as 4 digit hexadecimal value). First, 0kg values for all 4 sensors are written, followed by the 17kg values for all 4 sensors and last the 34kg values for all 4 sensors.

Calibration data is already applied by the kernel to all input values but may be used by user-space to perform other transformations.

### /sys/bus/hid/drivers/wiimote/<dev>/devtype

Defined on file *sysfs-driver-hid-wiimote*

While a device is initialized by the wiimote driver, we perform a device detection and signal a “change” uevent after it is done. This file shows the detected device type. “pending” means that the detection is still ongoing, “unknown” means, that the device couldn’t be detected or loaded. “generic” means, that the device couldn’t be detected but supports basic Wii Remote features and can be used. Other strings for each device-type are available and may be added if new device-specific detections are added. Currently supported are:

gen10:	First Wii Remote generation
gen20:	Second Wii Remote Plus generation (builtin MP)
balanceboard:	Wii Balance Board

### /sys/bus/hid/drivers/wiimote/<dev>/extension

Defined on file *sysfs-driver-hid-wiimote*

This file contains the currently connected and initialized extensions. It can be one of: none, motionp, nunchuck, classic, motionp+nunchuck, motionp+classic motionp is the official Nintendo Motion+ extension, nunchuck is the official Nintendo Nunchuck extension and classic is the Nintendo Classic Controller extension. The motionp extension can be combined with the other two.

Starting with kernel-version 3.11 Motion Plus hotplugging is supported and if detected, it’s no longer reported as static extension. You will get uevent notifications for the motion-plus device then.

/sys/bus/hid/drivers/wiimote/<dev>/led1  
/sys/bus/hid/drivers/wiimote/<dev>/led2  
/sys/bus/hid/drivers/wiimote/<dev>/led3  
/sys/bus/hid/drivers/wiimote/<dev>/led4

Defined on file *sysfs-driver-hid-wiimote*

Make it possible to set/get current led state. Reading from it returns 0 if led is off and 1 if it is on. Writing 0 to it disables the led, writing 1 enables it.

### /sys/bus/hid/drivers/wiimote/<dev>/pro\_calib

Defined on file *sysfs-driver-hid-wiimote*

This attribute is only provided if the device was detected as a pro-controller. It provides a single line with 4 calibration values for all 4 analog sticks. Format is: “x1:y1 x2:y2” . Data is prefixed with a +/- . Each value is a signed 16bit number.

Data is encoded as decimal numbers and specifies the offsets of the analog sticks of the pro-controller.

Calibration data is already applied by the kernel to all input values but may be used by user-space to perform other transformations.

Calibration data is detected by the kernel during device setup. You can write “scann” into this file to re-trigger calibration. You can also write data directly in the form “x1:y1 x2:y2” to set the calibration values manually.

---

**/sys/bus/hsi**

Defined on file [sysfs-bus-hsi](#)

High Speed Synchronous Serial Interface (HSI) is a serial interface mainly used for connecting application engines (APE) with cellular modem engines (CMT) in cellular handsets. The bus will be populated with devices (hs1\_clients) representing the protocols available in the system. Bus drivers implement those protocols.

---

**/sys/bus/hsi/devices/…/modalias**

Defined on file [sysfs-bus-hsi](#)

Stores the same MODALIAS value emitted by uevent Format: hsi:<hs1\_client device name>

---

**/sys/bus/i2c/…/idle\_state**

Defined on file [sysfs-bus-i2c-devices-pca954x](#)

Value that exists only for mux devices that can be written to control the behaviour of the multiplexer on idle. Possible values:

- |        |  |
|--------|--|
| -2     | disconnect on idle, i.e. deselect the last used channel, which is useful when there is a device with an address that conflicts with another device on another mux on the same parent bus.                      |
| -1     | leave the mux as-is, which is the most optimal setting in terms of I2C operations and is the default mode.   |
| 0..<n> | set the mux to a predetermined channel, which is useful if there is one channel that is used almost always, and you want to reduce the latency for normal operations after rare transactions on other channels |

---

**/sys/bus/i2c/devices/…/bd9571mwv-regulator.\*.auto/backup\_mode**

Defined on file [sysfs-driver-bd9571mwv-regulator](#)

Read/write the current state of DDR Backup Mode, which controls if DDR power rails will be kept powered during system suspend. (“on” / “1” = enabled, “off” / “0” = disabled). Two types of power switches (or control signals) can be used:

- A. With a momentary power switch (or pulse signal), DDR Backup Mode is enabled by default when available, as the PMIC will be configured only during system suspend.
- B. With a toggle power switch (or level signal), the following steps must be followed exactly:
  1. Configure PMIC for backup mode, to change the role of the accessory power switch from a power switch to a wake-up switch,
  2. Switch accessory power switch off, to prepare for system suspend, which is a manual step not controlled by software,
  3. Suspend system,
  4. Switch accessory power switch on, to resume the system.

DDR Backup Mode must be explicitly enabled by the user, to invoke step 1.

See also Documentation/devicetree/bindings/mfd/bd9571mwv.txt.

Users: User space applications for embedded boards equipped with a BD9571MWV PMIC.

### **/sys/bus/i2c/devices/…/calibration**

Defined on file [sysfs-bus-i2c-devices-hm6352](#)

Sets the calibration on or off (1 = on, 0 = off). See the chip data sheet.

### **/sys/bus/i2c/devices/…/device**

Defined on file [sysfs-bus-i2c-devices-fsa9480](#)

show what device is attached

NONE	no device
USB	USB device is attached
UART	UART is attached
CHARGER	Charger is attached
JIG	JIG is attached

### **/sys/bus/i2c/devices/…/heading0\_input**

Defined on file [sysfs-bus-i2c-devices-hm6352](#)

Reports the current heading from the compass as a floating point value in degrees.

### **/sys/bus/i2c/devices/…/output\_hvled[n]**

Defined on file [sysfs-bus-i2c-devices-lm3533](#)

Set the controlling backlight device for high-voltage current sink HVLED[n] (n = 1, 2) (0, 1).

---

**/sys/bus/i2c/devices/…/output\_lvled[n]**

Defined on file *sysfs-bus-i2c-devices-lm3533*

Set the controlling led device for low-voltage current sink LVLED[n] (n = 1..5) (0..3).

---

**/sys/bus/i2c/devices/…/power\_state**

Defined on file *sysfs-bus-i2c-devices-hm6352*

Sets the power state of the device. 0 sets the device into sleep mode, 1 wakes it up.

---

**/sys/bus/i2c/devices/…/switch**

Defined on file *sysfs-bus-i2c-devices-fsa9480*

show or set the state of manual switch

VAUDIO	switch to VAUDIO path
UART	switch to UART path
AUDIO	switch to AUDIO path
DHOST	switch to DHOST path
AUTO	switch automatically by device

---

**/sys/bus/i2c/devices/…/trickle\_charge\_bypass**

Defined on file *sysfs-bus-i2c-devices-bq32k*

Attribute for enable/disable the trickle charge bypass The trickle\_charge\_bypass attribute allows the userspace to enable/disable the Trickle charge FET bypass.

---

**/sys/bus/i2c/devices/xxx/fw\_version**

Defined on file *sysfs-driver-input-exc3000*

Reports the firmware version provided by the touchscreen, for example “00\_T6” on a EXC80H60

Access: Read

Valid values: Represented as string

---

**/sys/bus/i2c/devices/xxx/model**

Defined on file *sysfs-driver-input-exc3000*

Reports the model identification provided by the touchscreen, for example “Orion\_1320” on a EXC80H60

Access: Read

Valid values: Represented as string

**/sys/bus/i2c/drivers/ucsi\_ccg/…/do\_flash**

Defined on file *sysfs-driver-ucsi-ccg*

Tell the driver for Cypress CCGx Type-C controller to attempt firmware upgrade by writing [Yy1] to the file.

**/sys/bus/i3c/devices/<bus-id>-<device-pid>**

Defined on file *sysfs-bus-i3c*

These directories are just symbolic links to /sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>.

**/sys/bus/i3c/devices/i3c-<bus-id>**

Defined on file *sysfs-bus-i3c*

An I3C bus. This directory will contain one sub-directory per I3C device present on the bus.

**/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>**

Defined on file *sysfs-bus-i3c*

An I3C device present on I3C bus identified by <bus-id>. Note that all devices are represented including the master driving the bus.

**/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/bcr**

Defined on file *sysfs-bus-i3c*

BCR stands for Bus Characteristics Register and express the device capabilities in term of speed, maximum read/write length, etc. See the I3C specification for more details.

**/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/dcr**

Defined on file *sysfs-bus-i3c*

DCR stands for Device Characteristics Register and express the device capabilities in term of exposed features. See the I3C specification for more details.

---

**/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/dynamic\_address**

Defined on file *sysfs-bus-i3c*

Dynamic address assigned to device <bus-id>-<device-pid>. This address may change if the bus is re-initialized.

---

**/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/hdrcap**

Defined on file *sysfs-bus-i3c*

Expose the HDR (High Data Rate) capabilities of a device. Returns a list of supported HDR mode, each element is separated by space. Modes can be “hdr-ddr”, “hdr-tsp” and “hdr-tsl” .

See the I3C specification for more details about these HDR modes.

---

**/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/pid**

Defined on file *sysfs-bus-i3c*

PID stands for Provisional ID and is used to uniquely identify a device on a bus. This PID contains information about the vendor, the part and an instance ID so that several devices of the same type can be connected on the same bus. See the I3C specification for more details.

---

**/sys/bus/i3c/devices/i3c-<bus-id>/bcr**

Defined on file *sysfs-bus-i3c*

BCR stands for Bus Characteristics Register and express the device capabilities in term of speed, maximum read/write length, etc. See the I3C specification for more details. This entry describes the BCR of the master controller driving the bus.

---

**/sys/bus/i3c/devices/i3c-<bus-id>/current\_master**

Defined on file *sysfs-bus-i3c*

Expose the master that owns the bus (<bus-id>-<master-pid>) at the time this file is read. Note that bus ownership can change overtime, so there’s no guarantee that when the read() call returns, the value returned is still valid.

---

**/sys/bus/i3c/devices/i3c-<bus-id>/dcr**

Defined on file *sysfs-bus-i3c*

DCR stands for Device Characteristics Register and express the device capabilities in term of exposed features. See the I3C specification for more details. This entry describes the DCR of the master controller driving the bus.

### **/sys/bus/i3c/devices/i3c-<bus-id>/dynamic\_address**

Defined on file *sysfs-bus-i3c*

Dynamic address assigned to the master controller. This address may change if the bus is re-initialized.

### **/sys/bus/i3c/devices/i3c-<bus-id>/hdrcap**

Defined on file *sysfs-bus-i3c*

Expose the HDR (High Data Rate) capabilities of a device. Returns a list of supported HDR mode, each element is separated by space. Modes can be “hdr-ddr” , “hdr-tsp” and “hdr-tsl” . See the I3C specification for more details about these HDR modes.

This entry describes the HDRCAP of the master controller driving the bus.

### **/sys/bus/i3c/devices/i3c-<bus-id>/i2c\_scl\_frequency**

Defined on file *sysfs-bus-i3c*

The frequency (expressed in Hz) of the SCL signal when operating in I2C mode.

### **/sys/bus/i3c/devices/i3c-<bus-id>/i3c\_scl\_frequency**

Defined on file *sysfs-bus-i3c*

The frequency (expressed in Hz) of the SCL signal when operating in I3C SDR mode.

### **/sys/bus/i3c/devices/i3c-<bus-id>/mode**

Defined on file *sysfs-bus-i3c*

I3C bus mode. Can be “pure” , “mixed-fast” or “mixed-slow” . See the I3C specification for a detailed description of what each of these modes implies.

### **/sys/bus/i3c/devices/i3c-<bus-id>/pid**

Defined on file *sysfs-bus-i3c*

PID stands for Provisional ID and is used to uniquely identify a device on a bus. This PID contains information about the vendor, the part and an instance ID so that several devices of the same type can be connected on the same bus. See

the I3C specification for more details. This entry describes the PID of the master controller driving the bus.

---

**/sys/bus/iio/devices/device[n]/in\_illuminance0\_calibrate**

Defined on file [sysfs-bus-iio-light-tsl2772](#)

Causes an internal calibration of the als gain trim value which is later used in calculating illuminance in lux.

---

**/sys/bus/iio/devices/device[n]/in\_illuminance\_calibrate**

Defined on file [sysfs-bus-iio-light-tsl2583](#)

This property causes an internal calibration of the als gain trim value which is later used in calculating illuminance in lux.

---

**/sys/bus/iio/devices/device[n]/in\_illuminance\_input\_target**

Defined on file [sysfs-bus-iio-light-tsl2583](#)

This property is the known externally illuminance (in lux). It is used in the process of calibrating the device accuracy.

---

**/sys/bus/iio/devices/device[n]/in\_illuminance\_lux\_table**

Defined on file [sysfs-bus-iio-light-tsl2583](#)

This property gets/sets the table of coefficients used in calculating illuminance in lux.

---

**/sys/bus/iio/devices/device[n]/in\_proximity0\_calibrate**

Defined on file [sysfs-bus-iio-light-tsl2772](#)

Causes a recalculation and adjustment to the proximity\_thresh\_rising\_value.

---

**/sys/bus/iio/devices/iio:device\*/buffer/hwfifo\_timeout**

Defined on file [sysfs-bus-iio](#)

A read/write property to provide capability to delay reporting of samples till a timeout is reached. This allows host processors to sleep, while the sensor is storing samples in its internal fifo. The maximum timeout in seconds can be specified by setting hwfifo\_timeout. The current delay can be read by reading hwfifo\_timeout. A value of 0 means that there is no timeout.

---

**/sys/bus/iio/devices/iio:deviceX**

Defined on file *sysfs-bus-iio*

Hardware chip or device accessed by one communication port. Corresponds to a grouping of sensor channels. X is the IIO index of the device.

**/sys/bus/iio/devices/iio:deviceX/ac\_excitation\_en**

---

Defined on file *sysfs-bus-iio-adc-ad7192*

This attribute, if available, is used to enable the AC excitation mode found on some converters. In ac excitation mode, the polarity of the excitation voltage is reversed on alternate cycles, to eliminate DC errors.

**/sys/bus/iio/devices/iio:deviceX/battery\_low**

---

Defined on file *sysfs-bus-iio-meas-spec*

Reading returns either ‘1’ or ‘0’ . ‘1’ means that the battery level supplied to sensor is below 2.25V. This ABI is available for tsys02d, htu21, ms8607

**/sys/bus/iio/devices/iio:deviceX/bridge\_switch\_en**

---

Defined on file *sysfs-bus-iio-adc-ad7192*

This attribute, if available, is used to close or open the bridge power down switch found on some converters. In bridge applications, such as strain gauges and load cells, the bridge itself consumes the majority of the current in the system. To minimize the current consumption of the system, the bridge can be disconnected (when it is not being used using the bridge\_switch\_en attribute).

**/sys/bus/iio/devices/iio:deviceX/buffer**

---

Defined on file *sysfs-bus-iio*

Directory of attributes relating to the buffer for the device.

**/sys/bus/iio/devices/iio:deviceX/buffer/data\_available**

---

Defined on file *sysfs-bus-iio*

A read-only value indicating the bytes of data available in the buffer. In the case of an output buffer, this indicates the amount of empty space available to write data to. In the case of an input buffer, this indicates the amount of data available for reading.

**/sys/bus/iio/devices/iio:deviceX/buffer/enable**

---

Defined on file *sysfs-bus-iio*

Actually start the buffer capture up. Will start trigger if first device and appropriate.

---

**/sys/bus/iio/devices/iio:deviceX/buffer/hwfifo\_enabled**

---

Defined on file *sysfs-bus-iio*

A read-only boolean value that indicates if the hardware fifo is currently enabled or disabled. If the device does not have a hardware fifo this entry is not present. The hardware fifo is enabled when the buffer is enabled if the current hardware fifo watermark level is set and other current device settings allows it (e.g. if a trigger is set that samples data differently that the hardware fifo does then hardware fifo will not enabled).

If the hardware fifo is enabled and the level of the hardware fifo reaches the hardware fifo watermark level the device will flush its hardware fifo to the device buffer. Doing a non blocking read on the device when no samples are present in the device buffer will also force a flush.

When the hardware fifo is enabled there is no need to use a trigger to use buffer mode since the watermark settings guarantees that the hardware fifo is flushed to the device buffer.

---

**/sys/bus/iio/devices/iio:deviceX/buffer/hwfifo\_watermark**

---

Defined on file *sysfs-bus-iio*

Read-only entry that contains a single integer specifying the current watermark level for the hardware fifo. If the device does not have a hardware fifo this entry is not present. The watermark level for the hardware fifo is set by the driver based on the value set by the user in buffer/watermark but taking into account hardware limitations (e.g. most hardware buffers are limited to 32-64 samples, some hardware buffers watermarks are fixed or have minimum levels). A value of 0 means that the hardware watermark is unset.

---

**/sys/bus/iio/devices/iio:deviceX/buffer/hwfifo\_watermark\_available**

---

Defined on file *sysfs-bus-iio*

A list of positive integers specifying the available watermark levels for the hardware fifo. This entry is optional and if it is not present it means that all the values between hwfifo\_watermark\_min and hwfifo\_watermark\_max are supported.

If the user sets buffer/watermark to a value greater than hwfifo\_watermark\_min but not equal to any of the values in this list, the driver will chose an appropriate value for the hardware fifo watermark level.

---

**/sys/bus/iio/devices/iio:deviceX/buffer/hwfifo\_watermark\_max**

---

Defined on file *sysfs-bus-iio*

A single positive integer specifying the maximum watermark level for the hardware fifo of this device. If the device does not have a hardware fifo this entry is not present.

If the user sets buffer/watermark to a value greater than this one, then the hardware watermark will be capped at this value.

---

**/sys/bus/iio/devices/iio:deviceX/buffer/hwfifo\_watermark\_min**

---

Defined on file [sysfs-bus-iio](#)

A single positive integer specifying the minimum watermark level for the hardware fifo of this device. If the device does not have a hardware fifo this entry is not present.

If the user sets buffer/watermark to a value less than this one, then the hardware watermark will remain unset.

---

**/sys/bus/iio/devices/iio:deviceX/buffer/length**

---

Defined on file [sysfs-bus-iio](#)

Number of scans contained by the buffer.

---

**/sys/bus/iio/devices/iio:deviceX/buffer/length\_align\_bytes**

---

Defined on file [sysfs-bus-iio-dma-buffer](#)

DMA buffers tend to have a alignment requirement for the buffers. If this alignment requirement is not met samples might be dropped from the buffer.

This property reports the alignment requirements in bytes. This means that the buffer size in bytes needs to be a integer multiple of the number reported by this file.

The alignment requirements in number of sample sets will depend on the enabled channels and the bytes per channel. This means that the alignment requirement in samples sets might change depending on which and how many channels are enabled. Whereas the alignment requirement reported in bytes by this property will remain static and does not depend on which channels are enabled.

---

**/sys/bus/iio/devices/iio:deviceX/buffer/watermark**

---

Defined on file [sysfs-bus-iio](#)

A single positive integer specifying the maximum number of scan elements to wait for.

Poll will block until the watermark is reached.

Blocking read will wait until the minimum between the requested read amount or the low water mark is available.

Non-blocking read will retrieve the available samples from the buffer even if there are less samples than watermark level. This allows the application to block on poll with a timeout and read the available samples after the timeout expires and thus have a maximum delay guarantee.

---

**/sys/bus/iio/devices/iio:deviceX/calibrate**

Defined on file *sysfs-bus-iio-cros-ec*

Writing ‘1’ will perform a FOC (Fast Online Calibration). The corresponding calibration offsets can be read from \*\_calibbias entries.

---

**/sys/bus/iio/devices/iio:deviceX/calibration\_auto\_enable**

Defined on file *sysfs-bus-iio-scd30*

Contaminants build-up in the measurement chamber or optical elements deterioration leads to sensor drift.

One can compensate for sensor drift by using automatic self calibration procedure (asc).

Writing 1 or 0 to this attribute will respectively activate or deactivate asc.

Upon reading current asc status is returned.

---

**/sys/bus/iio/devices/iio:deviceX/calibration\_forced\_value**

Defined on file *sysfs-bus-iio-scd30*

Contaminants build-up in the measurement chamber or optical elements deterioration leads to sensor drift.

One can compensate for sensor drift by using forced recalibration (frc). This is useful in case there’s known co2 reference available nearby the sensor.

Picking value from the range [400 1 2000] and writing it to the sensor will set frc.

Upon reading current frc value is returned. Note that after power cycling default value (i.e 400) is returned even though internally sensor had recalibrated itself.

---

**/sys/bus/iio/devices/iio:deviceX/cleaning\_period**

Defined on file *sysfs-bus-iio-sps30*

Sensor is capable of triggering self cleaning periodically. Period can be changed by writing a new value here. Upon reading the current one is returned. Units are seconds.

Writing 0 disables periodical self cleaning entirely.

---

**/sys/bus/iio/devices/iio:deviceX/cleaning\_period\_available**

Defined on file *sysfs-bus-iio-sps30*

The range of available values in seconds represented as the minimum value, the step and the maximum value, all enclosed in square brackets.

---

### **/sys/bus/iio/devices/iio:deviceX/current\_timestamp\_clock**

---

Defined on file *sysfs-bus-iio*

String identifying current posix clock used to timestamp buffered samples and events for device X.

---

### **/sys/bus/iio/devices/iio:deviceX/events**

---

Defined on file *sysfs-bus-iio*

Configuration of which hardware generated events are passed up to user-space.

---

### **/sys/bus/iio/devices/iio:deviceX/events/in\_illuminance\_period\_available**

---

Defined on file *sysfs-bus-iio*

List of valid periods (in seconds) for which the light intensity must be above the threshold level before interrupt is asserted.

---

### **/sys/bus/iio/devices/iio:deviceX/events/in\_voltageY\_thresh\_falling\_value**

---

Defined on file *sysfs-bus-iio-adc-hi8435*

Channel Y low voltage threshold. If sensor input voltage goes lower then this value then the threshold falling event is pushed. Depending on *in\_voltageY\_sensing\_mode* the low voltage threshold is separately set for “GND-Open” and “Supply-Open” modes. Channels 0..31 have common low threshold values, but could have different *sensing\_modes*.

The low voltage threshold range is between 2..21V. Hysteresis between low and high thresholds can not be lower then 2 and can not be odd.

If falling threshold results hysteresis to odd value then rising threshold is automatically subtracted by one.

---

### **/sys/bus/iio/devices/iio:deviceX/events/in\_voltageY\_thresh\_rising\_value**

---

Defined on file *sysfs-bus-iio-adc-hi8435*

Channel Y high voltage threshold. If sensor input voltage goes higher then this value then the threshold rising event is pushed. Depending on *in\_voltageY\_sensing\_mode* the high voltage threshold is separately set for “GND-Open” and “Supply-Open” modes.

Channels 0..31 have common high threshold values, but could have different sensing\_modes.

The high voltage threshold range is between 3..22V. Hysteresis between low and high thresholds can not be lower than 2 and can not be odd.

If rising threshold results hysteresis to odd value then falling threshold is automatically appended by one.

---

**/sys/bus/iio/devices/iio:deviceX/fault\_oc**

Defined on file *sysfs-bus-iio-temperature-max31856*

Open-circuit fault. The detection of open-circuit faults, such as those caused by broken thermocouple wires. Reading returns either ‘1’ or ‘0’ .

- |     |  |
|-----|--|
| ‘1’ | An open circuit such as broken thermocouple wires has been detected. |
| ‘0’ | No open circuit or broken thermocouple wires are detected            |
- 

---

**/sys/bus/iio/devices/iio:deviceX/fault\_ovuv**

Defined on file *sysfs-bus-iio-temperature-max31856*

Overvoltage or Undervoltage Input Fault. The internal circuitry is protected from excessive voltages applied to the thermocouple cables by integrated MOSFETs at the T+ and T- inputs, and the BIAS output. These MOSFETs turn off when the input voltage is negative or greater than VDD.

Reading returns either ‘1’ or ‘0’ .

- |     |   |
|-----|---|
| ‘1’ | The input voltage is negative or greater than VDD.              |
| ‘0’ | The input voltage is positive and less than VDD (normal state). |
- 

---

**/sys/bus/iio/devices/iio:deviceX/heater\_enable**

Defined on file *sysfs-bus-iio*

‘1’ (enable) or ‘0’ (disable) specifying the enable of heater function. Same reading values apply.

This ABI is especially applicable for humidity sensors to heatup the device and get rid of any condensation in some humidity environment

---

**/sys/bus/iio/devices/iio:deviceX/id**

Defined on file *sysfs-bus-iio-cros-ec*

This attribute is exposed by the CrOS EC sensors driver and represents the sensor ID as exposed by the EC. This ID is used by the Android sensor service hardware abstraction layer (sensor HAL) through the Android container on ChromeOS.

```
/sys/bus/iio/devices/iio:deviceX/in_X_mean_raw
```

Defined on file [sysfs-bus-iio](#)

Averaged raw measurement from channel X. The number of values used for averaging is device specific. The converting rules for normal raw values also applies to the averaged raw values.

```
/sys/bus/iio/devices/iio:deviceX/in_accel_calibbias_available  
/sys/bus/iio/devices/iio:deviceX/in_anglvel_calibbias_available
```

Defined on file [sysfs-bus-iio-icm42600](#)

Range of available values for hardware offset. Values in SI units (m/s<sup>2</sup> for accelerometer and rad/s for gyroscope).

```
/sys/bus/iio/devices/iio:deviceX/in_accel_offset  
/sys/bus/iio/devices/iio:deviceX/in_accel_x_offset  
/sys/bus/iio/devices/iio:deviceX/in_accel_y_offset  
/sys/bus/iio/devices/iio:deviceX/in_accel_z_offset  
/sys/bus/iio/devices/iio:deviceX/in_voltageY_offset  
/sys/bus/iio/devices/iio:deviceX/in_voltage_offset  
/sys/bus/iio/devices/iio:deviceX/in_voltageY_i_offset  
/sys/bus/iio/devices/iio:deviceX/in_voltageY_q_offset  
/sys/bus/iio/devices/iio:deviceX/in_voltage_q_offset  
/sys/bus/iio/devices/iio:deviceX/in_voltage_i_offset  
/sys/bus/iio/devices/iio:deviceX/in_currentY_offset  
/sys/bus/iio/devices/iio:deviceX/in_current_offset  
/sys/bus/iio/devices/iio:deviceX/in_currentY_i_offset  
/sys/bus/iio/devices/iio:deviceX/in_currentY_q_offset  
/sys/bus/iio/devices/iio:deviceX/in_current_q_offset  
/sys/bus/iio/devices/iio:deviceX/in_current_i_offset  
/sys/bus/iio/devices/iio:deviceX/in_tempY_offset  
/sys/bus/iio/devices/iio:deviceX/in_temp_offset  
/sys/bus/iio/devices/iio:deviceX/in_pressureY_offset  
/sys/bus/iio/devices/iio:deviceX/in_pressure_offset  
/sys/bus/iio/devices/iio:deviceX/in_humidityrelative_offset  
/sys/bus/iio/devices/iio:deviceX/in_magn_offset  
/sys/bus/iio/devices/iio:deviceX/in_rot_offset  
/sys/bus/iio/devices/iio:deviceX/in_angl_offset
```

Defined on file [sysfs-bus-iio](#)

If known for a device, offset to be added to <type>[Y]\_raw prior to scaling by <type>[Y]\_scale in order to obtain value in the <type> units as specified in <type>[Y]\_raw documentation. Not present if the offset is always 0 or unknown.

If Y or axis <x|y|z> is not present, then the offset applies to all in channels of <type>. May be writable if a variable offset can be applied on the device. Note that this is different to calibbias which is for devices (or drivers) that apply offsets to compensate for variation between different instances of the part, typically adjusted by using some hardware supported calibration procedure. Calibbias is applied internally, offset is applied in userspace to the \_raw output.

---

```
/sys/bus/iio/devices/iio:deviceX/in_accel_scale_available
/sys/.../iio:deviceX/in_anglvel_scale_available
/sys/.../iio:deviceX/in_magn_scale_available
/sys/.../iio:deviceX/in_illuminance_scale_available
/sys/.../iio:deviceX/in_intensity_scale_available
/sys/.../iio:deviceX/in_proximity_scale_available
/sys/.../iio:deviceX/in_voltageX_scale_available
/sys/.../iio:deviceX/in_voltage-voltage_scale_available
/sys/.../iio:deviceX/out_voltageX_scale_available
/sys/.../iio:deviceX/out_altvoltageX_scale_available
/sys/.../iio:deviceX/in_capacitance_scale_available
/sys/.../iio:deviceX/in_pressure_scale_available
/sys/.../iio:deviceX/in_pressureY_scale_available
```

---

Defined on file [sysfs-bus-iio](#)

If a discrete set of scale values is available, they are listed in this attribute.

---

```
/sys/bus/iio/devices/iio:deviceX/in_accel_x_calibbias
/sys/bus/iio/devices/iio:deviceX/in_accel_y_calibbias
/sys/bus/iio/devices/iio:deviceX/in_accel_z_calibbias
/sys/bus/iio/devices/iio:deviceX/in_anglvel_x_calibbias
/sys/bus/iio/devices/iio:deviceX/in_anglvel_y_calibbias
/sys/bus/iio/devices/iio:deviceX/in_anglvel_z_calibbias
```

---

Defined on file [sysfs-bus-iio-icm42600](#)

Hardware applied calibration offset (assumed to fix production inaccuracies). Values represent a real physical offset expressed in SI units (m/s<sup>2</sup> for accelerometer and rad/s for gyroscope).

---

```
/sys/bus/iio/devices/iio:deviceX/in_accel_x_calibbias
/sys/bus/iio/devices/iio:deviceX/in_accel_y_calibbias
/sys/bus/iio/devices/iio:deviceX/in_accel_z_calibbias
/sys/bus/iio/devices/iio:deviceX/in_anglvel_x_calibbias
/sys/bus/iio/devices/iio:deviceX/in_anglvel_y_calibbias
/sys/bus/iio/devices/iio:deviceX/in_anglvel_z_calibbias
/sys/bus/iio/devices/iio:deviceX/in_illuminance0_calibbias
/sys/bus/iio/devices/iio:deviceX/in_proximity0_calibbias
/sys/bus/iio/devices/iio:deviceX/in_pressureY_calibbias
/sys/bus/iio/devices/iio:deviceX/in_pressure_calibbias
```

---

Defined on file [sysfs-bus-iio](#)

Hardware applied calibration offset (assumed to fix production inaccuracies).

```
/sys/bus/iio/devices/iio:deviceX/in_accel_x_peak_raw  
/sys/bus/iio/devices/iio:deviceX/in_accel_y_peak_raw  
/sys/bus/iio/devices/iio:deviceX/in_accel_z_peak_raw
```

Defined on file [sysfs-bus-iio](#)

Highest value since some reset condition. These attributes allow access to this and are otherwise the direct equivalent of the <type>Y[\_name]\_raw attributes.

```
/sys/bus/iio/devices/iio:deviceX/in_accel_x_raw  
/sys/bus/iio/devices/iio:deviceX/in_accel_y_raw  
/sys/bus/iio/devices/iio:deviceX/in_accel_z_raw
```

Defined on file [sysfs-bus-iio](#)

Acceleration in direction x, y or z (may be arbitrarily assigned but should match other such assignments on device). Has all of the equivalent parameters as per voltageY. Units after application of scale and offset are m/s<sup>2</sup>.

```
/sys/bus/iio/devices/iio:deviceX/in_accel_xyz_squared_peak_raw
```

Defined on file [sysfs-bus-iio](#)

A computed peak value based on the sum squared magnitude of the underlying value in the specified directions.

```
/sys/bus/iio/devices/iio:deviceX/in_activity_calibgender  
/sys/bus/iio/devices/iio:deviceX/in_energy_calibgender  
/sys/bus/iio/devices/iio:deviceX/in_distance_calibgender  
/sys/bus/iio/devices/iio:deviceX/in_velocity_calibgender
```

Defined on file [sysfs-bus-iio](#)

Gender of the user (e.g.: male, female) used by some pedometers to compute the stride length, distance, speed and activity type.

```
/sys/bus/iio/devices/iio:deviceX/in_activity_calibgender_available  
/sys/bus/iio/devices/iio:deviceX/in_energy_calibgender_available  
/sys/bus/iio/devices/iio:deviceX/in_distance_calibgender_available  
/sys/bus/iio/devices/iio:deviceX/in_velocity_calibgender_available
```

Defined on file [sysfs-bus-iio](#)

Lists all available gender values (e.g.: male, female).

---

```
/sys/bus/iio/devices/iio:deviceX/in_activity_calibheight
/sys/bus/iio/devices/iio:deviceX/in_energy_calibheight
/sys/bus/iio/devices/iio:deviceX/in_distance_calibheight
/sys/bus/iio/devices/iio:deviceX/in_velocity_calibheight
```

---

Defined on file [sysfs-bus-iio](#)

Height of the user (in meters) used by some pedometers to compute the stride length, distance, speed and activity type.

---

```
/sys/bus/iio/devices/iio:deviceX/in_allow_async_readout
```

---

Defined on file [sysfs-bus-iio-ina2xx-adc](#)

By default (value ‘0’), the capture thread checks for the Conversion Ready Flag to being set prior to committing a new value to the sample buffer. This synchronizes the in-chip conversion rate with the in-driver readout rate at the cost of an additional register read.

Writing ‘1’ will remove the polling for the Conversion Ready Flags to save the additional i2c transaction, which will improve the bandwidth available for reading data. However, samples can be occasionally skipped or repeated, depending on the beat between the capture and conversion rates.

---

```
/sys/bus/iio/devices/iio:deviceX/in_altvoltageY_compare_interval
```

---

Defined on file [sysfs-bus-iio-adc-envelope-detector](#)

Number of milliseconds to wait for the comparator in each step of the binary search for the input peak level. Needs to relate to the frequency of the input signal.

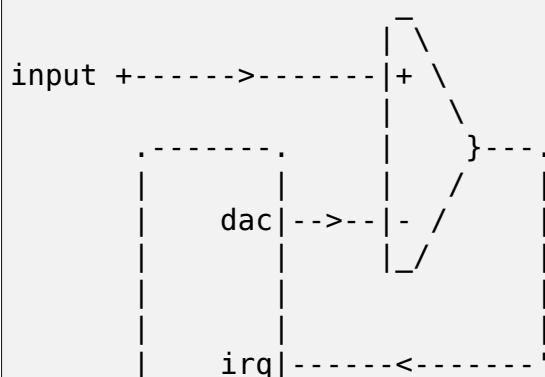

---

```
/sys/bus/iio/devices/iio:deviceX/in_altvoltageY_invert
```

---

Defined on file [sysfs-bus-iio-adc-envelope-detector](#)

The DAC is used to find the peak level of an alternating voltage input signal by a binary search using the output of a comparator wired to an interrupt pin. Like so:

(continues on next page)

(continued from previous page)

The boolean invert attribute (0/1) should be set when the input signal is centered around the maximum value of the dac instead of zero. The envelope detector will search from below in this case and will also invert the result.

The edge/level of the interrupt is also switched to its opposite value.

---

### **/sys/bus/iio/devices/iio:deviceX/in\_angl\_raw**

---

Defined on file *sysfs-bus-iio*

Angle of rotation. Units after application of scale and offset are radians.

---

### **/sys/bus/iio/devices/iio:deviceX/in\_anglev\_x\_raw /sys/bus/iio/devices/iio:deviceX/in\_anglev\_y\_raw /sys/bus/iio/devices/iio:deviceX/in\_anglev\_z\_raw**

---

Defined on file *sysfs-bus-iio*

Angular velocity about axis x, y or z (may be arbitrarily assigned). Has all the equivalent parameters as per voltageY. Units after application of scale and offset are radians per second.

---

### **/sys/bus/iio/devices/iio:deviceX/in\_capacitanceY\_raw**

---

Defined on file *sysfs-bus-iio*

Raw capacitance measurement from channel Y. Units after application of scale and offset are nanofarads.

---

### **/sys/bus/iio/devices/iio:deviceX/in\_concentration\_VOC\_short\_raw**

---

Defined on file *sysfs-bus-iio-chemical-vz89x*

Get the raw calibration VOC value from the sensor. This value has little application outside of calibration.

---

/sys/bus/iio/devices/iio:deviceX/in_concentration_raw
/sys/bus/iio/devices/iio:deviceX/in_concentrationX_raw

/sys/bus/iio/devices/iio:deviceX/in_concentration_voc_raw
/sys/bus/iio/devices/iio:deviceX/in_concentrationX_voc_raw

---

Defined on file [sysfs-bus-iio](#)

Raw (unscaled no offset etc.) reading of a substance. Units after application of scale and offset are percents.

---

/sys/bus/iio/devices/iio:deviceX/in_conversion_mode
---

---

Defined on file [sysfs-bus-iio-vf610](#)

Specifies the hardware conversion mode used. The three available modes are “normal” , “high-speed” and “low-power” , where the last is the default mode.

---

/sys/bus/iio/devices/iio:deviceX/in_count0_enable_mode
--

---

Defined on file [sysfs-bus-iio-timer-stm32](#)

Configure the device counter enable modes, in all case counting direction is set by in\_count0\_count\_direction attribute and the counter is clocked by the internal clock.

**always:**

Counter is always ON.

**gated:**

Counting is enabled when connected trigger signal level is high else counting is disabled.

**triggered:**

Counting is enabled on rising edge of the connected trigger, and remains enabled for the duration of this selected mode.

---

/sys/bus/iio/devices/iio:deviceX/in_count0_preset
---

---

Defined on file [sysfs-bus-iio-timer-stm32](#)

Reading returns the current preset value. Writing sets the preset value. When counting up the counter starts from 0 and fires an event when reach preset value.

When counting down the counter start from preset value and fire event when reach 0.

### **/sys/bus/iio/devices/iio:deviceX/in\_count0\_trigger\_mode**

Defined on file *sysfs-bus-iio-timer-stm32*

Configure the device counter trigger mode counting direction is set by in\_count0\_count\_direction attribute and the counter is clocked by the connected trigger rising edges.

### **/sys/bus/iio/devices/iio:deviceX/in\_countY\_count\_direction**

Defined on file *sysfs-bus-iio*

This interface is deprecated; please use the Counter subsystem.

Raw counter device counters direction for channel Y.

### **/sys/bus/iio/devices/iio:deviceX/in\_countY\_count\_mode**

Defined on file *sysfs-bus-iio-counter-104-quad-8*

This interface is deprecated; please use the Counter subsystem.

Count mode for channel Y. Four count modes are available: normal, range limit, non-recycle, and modulo-n. The preset value for channel Y is used by the count mode where required.

#### **Normal:**

Counting is continuous in either direction.

#### **Range Limit:**

An upper or lower limit is set, mimicking limit switches in the mechanical counterpart. The upper limit is set to the preset value, while the lower limit is set to 0. The counter freezes at count = preset when counting up, and at count = 0 when counting down. At either of these limits, the counting is resumed only when the count direction is reversed.

#### **Non-recycle:**

Counter is disabled whenever a 24-bit count overflow or underflow takes place. The counter is re-enabled when a new count value is loaded to the counter via a preset operation or write to raw.

#### **Modulo-N:**

A count boundary is set between 0 and the preset value. The counter is reset to 0 at count = preset when counting up, while the counter is set to the preset value at count = 0 when counting down; the counter does not freeze at the boundary points, but counts continuously throughout.

### **/sys/bus/iio/devices/iio:deviceX/in\_countY\_noise\_error**

Defined on file [sysfs-bus-iio-counter-104-quad-8](#)

This interface is deprecated; please use the Counter subsystem.

Read-only attribute that indicates whether excessive noise is present at the channel Y count inputs in quadrature clock mode; irrelevant in non-quadrature clock mode.

---

### `/sys/bus/iio/devices/iio:deviceX/in_countY_preset`

---

Defined on file [sysfs-bus-iio-counter-104-quad-8](#)

This interface is deprecated; please use the Counter subsystem.

If the counter device supports preset registers, the preset count for channel Y is provided by this attribute.

---

### `/sys/bus/iio/devices/iio:deviceX/in_countY_quadrature_mode`

---

Defined on file [sysfs-bus-iio-counter-104-quad-8](#)

This interface is deprecated; please use the Counter subsystem.

Configure channel Y counter for non-quadrature or quadrature clock mode. Selecting non-quadrature clock mode will disable synchronous load mode. In quadrature clock mode, the channel Y scale attribute selects the encoder phase division (scale of 1 selects full-cycle, scale of 0.5 selects half-cycle, scale of 0.25 selects quarter-cycle) processed by the channel Y counter.

**Non-quadrature:**

The filter and decoder circuit are bypassed. Encoder A input serves as the count input and B as the UP/DOWN direction control input, with B = 1 selecting UP Count mode and B = 0 selecting Down Count mode.

**Quadrature:**

Encoder A and B inputs are digitally filtered and decoded for UP/DN clock.

---

### `/sys/bus/iio/devices/iio:deviceX/in_countY_raw`

---

Defined on file [sysfs-bus-iio](#)

This interface is deprecated; please use the Counter subsystem.

Raw counter device counts from channel Y. For quadrature counters, multiplication by an available [Y]\_scale results in the counts of a single quadrature signal phase from channel Y.

---

### `/sys/bus/iio/devices/iio:deviceX/in_countY_set_to_preset_on_index`

---

Defined on file [sysfs-bus-iio-counter-104-quad-8](#)

This interface is deprecated; please use the Counter subsystem.

Whether to set channel Y counter with channel Y preset value when channel Y index input is active, or continuously count. Valid attribute values are boolean.

### **/sys/bus/iio/devices/iio:deviceX/in\_count\_count\_direction\_available**

Defined on file *sysfs-bus-iio*

This interface is deprecated; please use the Counter subsystem.

A list of possible counting directions which are:

- “up” : counter device is increasing.
- “down” : counter device is decreasing.

### **/sys/bus/iio/devices/iio:deviceX/in\_count\_count\_mode\_available /sys/bus/iio/devices/iio:deviceX/in\_count\_noise\_error\_available /sys/bus/iio/devices/iio:deviceX/in\_count\_quadrature\_mode\_available /sys/bus/iio/devices/iio:deviceX/in\_index\_index\_polarity\_available /sys/bus/iio/devices/iio:deviceX/in\_index\_synchronous\_mode\_available**

Defined on file *sysfs-bus-iio-counter-104-quad-8*

This interface is deprecated; please use the Counter subsystem.

Discrete set of available values for the respective counter configuration are listed in this file.

### **/sys/bus/iio/devices/iio:deviceX/in\_count\_enable\_mode\_available**

Defined on file *sysfs-bus-iio-timer-stm32*

Reading returns the list possible enable modes.

### **/sys/bus/iio/devices/iio:deviceX/in\_count\_trigger\_mode\_available**

Defined on file *sysfs-bus-iio-timer-stm32*

Reading returns the list possible trigger modes.

### **/sys/bus/iio/devices/iio:deviceX/in\_currentX\_raw /sys/bus/iio/devices/iio:deviceX/in\_currentX\_i\_raw /sys/bus/iio/devices/iio:deviceX/in\_currentX\_q\_raw**

Defined on file *sysfs-bus-iio*

Raw current measurement from channel X. Units are in millamps after application of scale and offset. If no offset or scale is present, output should be considered as processed with the unit in millamps.

Channels with ‘i’ and ‘q’ modifiers always exist in pairs and both channels refer to the same signal. The ‘i’ channel contains the in-phase component of the signal while the ‘q’ channel contains the quadrature component.

---

```
/sys/bus/iio/devices/iio:deviceX/in_currentY_raw  
/sys/bus/iio/devices/iio:deviceX/in_currentY_supply_raw
```

---

Defined on file *sysfs-bus-iio*

Raw (unscaled no bias removal etc.) current measurement from channel Y. In special cases where the channel does not correspond to externally available input one of the named versions may be used. The number must always be specified and unique to allow association with event codes. Units after application of scale and offset are millamps.

---

```
/sys/bus/iio/devices/iio:deviceX/in_current_shunt_resistor
```

---

Defined on file *sysfs-bus-iio-adc-max9611*

The value of the shunt resistor used to compute current flowing between RS+ and RS- voltage sense inputs. In Ohms.

These attributes describe a single physical component, exposed as two distinct attributes as it is used to calculate two different values: power load and current flowing between RS+ and RS- inputs.

---

```
/sys/bus/iio/devices/iio:deviceX/in_electricalconductivity_raw
```

---

Defined on file *sysfs-bus-iio*

Raw (unscaled no offset etc.) electric conductivity reading that can be processed to siemens per meter.

---

```
/sys/bus/iio/devices/iio:deviceX/in_energy_calibweight
```

---

Defined on file *sysfs-bus-iio*

Weight of the user (in kg). It is needed by some pedometers to compute the calories burnt by the user.

---

```
/sys/bus/iio/devices/iio:deviceX/in_filter_notch_center_frequency
```

---

Defined on file *sysfs-bus-iio*

Center frequency in Hz for a notch filter. Used i.e. for line noise suppression.

---

```
/sys/bus/iio/devices/iio:deviceX/in_gravity_x_raw  
/sys/bus/iio/devices/iio:deviceX/in_gravity_y_raw  
/sys/bus/iio/devices/iio:deviceX/in_gravity_z_raw
```

---

Defined on file [sysfs-bus-iio](#)

Gravity in direction x, y or z (may be arbitrarily assigned but should match other such assignments on device). Units after application of scale and offset are m/s<sup>2</sup>.

```
/sys/bus/iio/devices/iio:deviceX/in_gyro_matrix  
/sys/bus/iio/devices/iio:deviceX/in_accel_matrix  
/sys/bus/iio/devices/iio:deviceX/in_magn_matrix
```

Defined on file [sysfs-bus-iio-mpu6050](#)

This is mounting matrix for motion sensors. Mounting matrix is a 3x3 unitary matrix. A typical mounting matrix would look like [0, 1, 0; 1, 0, 0; 0, 0, -1]. Using this information, it would be easy to tell the relative positions among sensors as well as their positions relative to the board that holds these sensors. Identity matrix [1, 0, 0; 0, 1, 0; 0, 0, 1] means sensor chip and device are perfectly aligned with each other. All axes are exactly the same.

```
/sys/bus/iio/devices/iio:deviceX/in_humidityrelative_input
```

Defined on file [sysfs-bus-iio](#)

Scaled humidity measurement in milli percent.

```
/sys/bus/iio/devices/iio:deviceX/in_humidityrelative_raw
```

Defined on file [sysfs-bus-iio](#)

Raw humidity measurement of air. Units after application of scale and offset are milli percent.

```
/sys/bus/iio/devices/iio:deviceX/in_illuminance0_zone
```

Defined on file [sysfs-bus-iio-light-lm3533-als](#)

Get the current light zone (0..4) as defined by the in\_illuminance0\_threshY\_{falling,rising} thresholds.

```
/sys/bus/iio/devices/iio:deviceX/in_incli_x_raw  
/sys/bus/iio/devices/iio:deviceX/in_incli_y_raw  
/sys/bus/iio/devices/iio:deviceX/in_incli_z_raw
```

Defined on file [sysfs-bus-iio](#)

Inclination raw reading about axis x, y or z (may be arbitrarily assigned). Data converted by application of offset and scale to degrees.

```
/sys/bus/iio/devices/iio:deviceX/in_indexY_index_polarity
```

Defined on file [sysfs-bus-iio-counter-104-quad-8](#)

This interface is deprecated; please use the Counter subsystem.

Active level of channel Y index input; irrelevant in non-synchronous load mode.

### **/sys/bus/iio/devices/iio:deviceX/in\_indexY\_raw**

Defined on file [sysfs-bus-iio](#)

This interface is deprecated; please use the Counter subsystem.

Raw counter device index value from channel Y. This attribute provides an absolute positional reference (e.g. a pulse once per revolution) which may be used to home positional systems as required.

### **/sys/bus/iio/devices/iio:deviceX/in\_indexY\_synchronous\_mode**

Defined on file [sysfs-bus-iio-counter-104-quad-8](#)

This interface is deprecated; please use the Counter subsystem.

Configure channel Y counter for non-synchronous or synchronous load mode. Synchronous load mode cannot be selected in non-quadrature clock mode.

#### **Non-synchronous:**

A logic low level is the active level at this index input. The index function (as enabled via `set_to_preset_on_index`) is performed directly on the active level of the index input.

#### **Synchronous:**

Intended for interfacing with encoder Index output in quadrature clock mode. The active level is configured via `index_polarity`. The index function (as enabled via `set_to_preset_on_index`) is performed synchronously with the quadrature clock on the active level of the index input.

### **/sys/bus/iio/devices/iio:deviceX/in\_intensityY\_offset**

Defined on file [sysfs-bus-iio-health-afe440x](#)

Get and set the offset cancellation DAC setting for these stages. The values are expressed in 5-bit sign-magnitude.

### **/sys/bus/iio/devices/iio:deviceX/in\_intensityY\_raw**

Defined on file [sysfs-bus-iio-health-afe440x](#)

Get measured values from the ADC for these stages. Y is the specific stage number corresponding to datasheet stage names as follows:

1	LED2
2	ALED2/LED3
3	LED1
4	ALED1/LED4

---

Note that channels 5 and 6 represent LED2-ALED2 and LED1-ALED1 respectively which simply helper channels containing the calculated difference in the value of stage 1 - 2 and 3 - 4. The values are expressed in 24-bit two's complement.

---

**/sys/bus/iio/devices/iio:deviceX/in\_intensityY\_resistance**  
**/sys/bus/iio/devices/iio:deviceX/in\_intensityY\_capacitance**

---

Defined on file *sysfs-bus-iio-health-afe440x*

Get and set the resistance and the capacitance settings for the Transimpedance Amplifier during the associated stage.

---

**/sys/bus/iio/devices/iio:deviceX/in\_intensity.hardwaregain\_available**

---

Defined on file *sysfs-bus-iio*

Lists all available hardware applied gain factors. Shared across all channels.

---

**/sys/bus/iio/devices/iio:deviceX/in\_intensity\_ir\_large\_raw**

---

Defined on file *sysfs-bus-iio-light-si1133*

Unit-less infrared intensity. The intensity is measured from 4 dark photodiodes. “large” indicate the surface area capturing infrared.

---

**/sys/bus/iio/devices/iio:deviceX/in\_intensity\_ir\_small\_raw**

---

Defined on file *sysfs-bus-iio-light-si1133*

Unit-less infrared intensity. The intensity is measured from 1 dark photodiode. “small” indicate the surface area capturing infrared.

---

**/sys/bus/iio/devices/iio:deviceX/in\_intensity\_large\_raw**

---

Defined on file *sysfs-bus-iio-light-si1133*

Unit-less light intensity with more diodes.

---

**/sys/bus/iio/devices/iio:deviceX/in\_intensity\_x\_raw**  
**/sys/bus/iio/devices/iio:deviceX/in\_intensity\_y\_raw**  
**/sys/bus/iio/devices/iio:deviceX/in\_intensity\_z\_raw**

---

Defined on file [sysfs-bus-iio](#)

Unscaled light intensity according to CIE 1931/DIN 5033 color space. Units after application of scale are nano nanowatts per square meter.

---

/sys/bus/iio/devices/iio:deviceX/in_magn_x_oversampling_ratio
/sys/bus/iio/devices/iio:deviceX/in_magn_y_oversampling_ratio
/sys/bus/iio/devices/iio:deviceX/in_magn_z_oversampling_ratio

---

Defined on file [sysfs-bus-iio](#)

Hardware applied number of measurements for acquiring one data point. The HW will do <type>[\_name]\_oversampling\_ratio measurements and return the average value as output data. Each value resulted from <type>[\_name]\_oversampling\_ratio measurements is considered as one sample for <type>[\_name]\_sampling\_frequency.

---

/sys/bus/iio/devices/iio:deviceX/in_magn_x_raw
/sys/bus/iio/devices/iio:deviceX/in_magn_y_raw
/sys/bus/iio/devices/iio:deviceX/in_magn_z_raw

---

Defined on file [sysfs-bus-iio](#)

Magnetic field along axis x, y or z (may be arbitrarily assigned). Data converted by application of offset then scale to Gauss.

---

/sys/bus/iio/devices/iio:deviceX/in_massconcentration_pm1_input
/sys/bus/iio/devices/iio:deviceX/in_massconcentrationY_pm1_input

/sys/bus/iio/devices/iio:deviceX/in_massconcentrationY_pm10_input

---

Defined on file [sysfs-bus-iio](#)

Mass concentration reading of particulate matter in ug / m3. pmX consists of particles with aerodynamic diameter less or equal to X micrometers.

---

/sys/bus/iio/devices/iio:deviceX/in_ph_raw
--

---

Defined on file [sysfs-bus-iio](#)

Raw (unscaled no offset etc.) pH reading of a substance as a negative base-10 logarithm of hydrodium ions in a litre of water.

---

/sys/bus/iio/devices/iio:deviceX/in_phaseY_raw
--

---

Defined on file [sysfs-bus-iio](#)

Raw (unscaled) phase difference reading from channel Y that can be processed to radians.

```
/sys/bus/iio/devices/iio:deviceX/in_positionrelative_x_raw  
/sys/bus/iio/devices/iio:deviceX/in_positionrelative_y_raw
```

---

Defined on file [sysfs-bus-iio](#)

Relative position in direction x or y on a pad (may be arbitrarily assigned but should match other such assignments on device). Units after application of scale and offset are milli percents from the pad's size in both directions. Should be calibrated by the consumer.

```
/sys/bus/iio/devices/iio:deviceX/in_powerY_raw
```

---

Defined on file [sysfs-bus-iio](#)

Raw (unscaled no bias removal etc.) power measurement from channel Y. The number must always be specified and unique to allow association with event codes. Units after application of scale and offset are milliwatts.

```
/sys/bus/iio/devices/iio:deviceX/in_power_shunt_resistor
```

---

Defined on file [sysfs-bus-iio-adc-max9611](#)

The value of the shunt resistor used to compute power drain on common input voltage pin (RS+). In Ohms.

```
/sys/bus/iio/devices/iio:deviceX/in_pressureY_input  
/sys/bus/iio/devices/iio:deviceX/in_pressure_input
```

---

Defined on file [sysfs-bus-iio](#)

Scaled pressure measurement from channel Y, in kilopascal.

```
/sys/bus/iio/devices/iio:deviceX/in_pressureY_raw  
/sys/bus/iio/devices/iio:deviceX/in_pressure_raw
```

---

Defined on file [sysfs-bus-iio](#)

Raw pressure measurement from channel Y. Units after application of scale and offset are kilopascal.

```
/sys/bus/iio/devices/iio:deviceX/in_proximity0_agc_gain  
/sys/bus/iio/devices/iio:deviceX/in_proximity0_agc_gain_bias
```

---

Defined on file [sysfs-bus-iio-isl29501](#)

This sensor has an automatic gain control (agc) loop which sets the analog signal levels at an optimum level by controlling programmable gain amplifiers. The criteria for optimal gain is determined by the sensor.

Return the actual gain value as an integer in [0; 65536] range when read from.

The agc gain read when measuring crosstalk shall be written into in\_proximity0\_agc\_gain\_bias.

---

```
/sys/bus/iio/devices/iio:deviceX/in_proximity0_calib_phase_temp_a  
/sys/bus/iio/devices/iio:deviceX/in_proximity0_calib_phase_temp_b  
/sys/bus/iio/devices/iio:deviceX/in_proximity0_calib_phase_light_a  
/sys/bus/iio/devices/iio:deviceX/in_proximity0_calib_phase_light_b
```

---

Defined on file [sysfs-bus-iio-isl29501](#)

The sensor is able to perform correction of distance measurements due to changing temperature and ambient light conditions. It can be programmed to correct for a second order error polynomial.

Phase data has to be collected when temperature and ambient light are modulated independently.

Then a least squares curve fit to a second order polynomial has to be generated from the data. The resultant curves have the form  $ax^2 + bx + c$ .

From those two curves, a and b coefficients shall be stored in in\_proximity0\_calib\_phase\_temp\_a and in\_proximity0\_calib\_phase\_temp\_b for temperature and in in\_proximity0\_calib\_phase\_light\_a and in\_proximity0\_calib\_phase\_light\_b for ambient light.

Those values must be integer in [0; 8355840] range.

Finally, the c constant is set by the sensor internally.

The value stored in sensor is displayed when read from.

---

```
/sys/bus/iio/devices/iio:deviceX/in_proximity3_comb_raw
```

---

Defined on file [sysfs-bus-iio-sx9310](#)

Proximity measurement indicating that some object is near the combined sensor. The combined sensor presents proximity measurements constructed by hardware by combining measurements taken from a given set of physical sensors.

---

```
/sys/bus/iio/devices/iio:deviceX/in_proximity_input
```

---

Defined on file [sysfs-bus-iio-proximity-as3935](#)

Get the current distance in meters of storm (1km steps) 1000-40000 = distance in meters

---

```
/sys/bus/iio/devices/iio:deviceX/in_proximity_nearlevel
```

---

Defined on file [\*sysfs-bus-iio-proximity\*](#)

Near level for proximity sensors. This is a single integer value that tells user space when an object should be considered close to the device. If the value read from the sensor is above or equal to the value in this file an object should typically be considered near.

---

```
/sys/bus/iio/devices/iio:deviceX/in_resistance_raw  
/sys/bus/iio/devices/iio:deviceX/in_resistanceX_raw  
/sys/bus/iio/devices/iio:deviceX/out_resistance_raw  
/sys/bus/iio/devices/iio:deviceX/out_resistanceX_raw
```

---

Defined on file [\*sysfs-bus-iio\*](#)

Raw (unscaled no offset etc.) resistance reading that can be processed into an ohm value.

---

```
/sys/bus/iio/devices/iio:deviceX/in_rot_from_north_magnetic_tilt_comp_raw  
/sys/bus/iio/devices/iio:deviceX/in_rot_from_north_true_tilt_comp_raw  
/sys/bus/iio/devices/iio:deviceX/in_rot_from_north_magnetic_raw  
/sys/bus/iio/devices/iio:deviceX/in_rot_from_north_true_raw
```

---

Defined on file [\*sysfs-bus-iio\*](#)

Raw value of rotation from true/magnetic north measured with or without compensation from tilt sensors.

---

```
/sys/bus/iio/devices/iio:deviceX/in_rot_quaternion_raw
```

---

Defined on file [\*sysfs-bus-iio\*](#)

Raw value of quaternion components using a format x y z w. Here x, y, and z component represents the axis about which a rotation will occur and w component represents the amount of rotation.

---

```
/sys/bus/iio/devices/iio:deviceX/in_shunt_resistor
```

---

Defined on file [\*sysfs-bus-iio-ina2xx-adc\*](#)

The value of the shunt resistor may be known only at runtime from an eeprom content read by a client application. This attribute allows to set its value in ohms.

---

```
/sys/bus/iio/devices/iio:deviceX/in_tempX_input
```

---

Defined on file [\*sysfs-bus-iio\*](#)

Scaled temperature measurement in milli degrees Celsius.

---

/sys/bus/iio/devices/iio:deviceX/in_temp_calibmissivity
/sys/bus/iio/devices/iio:deviceX/in_tempX_calibmissivity
/sys/bus/iio/devices/iio:deviceX/in_temp_object_calibmissivity
/sys/bus/iio/devices/iio:deviceX/in_tempX_object_calibmissivity

---

Defined on file [sysfs-bus-iio](#)

The emissivity ratio of the surface in the field of view of the contactless temperature sensor. Emissivity varies from 0 to 1, with 1 being the emissivity of a black body.

---

/sys/bus/iio/devices/iio:deviceX/in_temp_object_calibambient
/sys/bus/iio/devices/iio:deviceX/in_tempX_object_calibambient

---

Defined on file [sysfs-bus-iio](#)

Calibrated ambient temperature for object temperature calculation in milli degrees Celsius.

---

/sys/bus/iio/devices/iio:deviceX/in_temp_raw
/sys/bus/iio/devices/iio:deviceX/in_tempX_raw
/sys/bus/iio/devices/iio:deviceX/in_temp_x_raw
/sys/bus/iio/devices/iio:deviceX/in_temp_y_raw
/sys/bus/iio/devices/iio:deviceX/in_temp_ambient_raw
/sys/bus/iio/devices/iio:deviceX/in_temp_object_raw

---

Defined on file [sysfs-bus-iio](#)

Raw (unscaled no bias removal etc.) temperature measurement. If an axis is specified it generally means that the temperature sensor is associated with one part of a compound device (e.g. a gyroscope axis). The ambient and object modifiers distinguish between ambient (reference) and distant temperature for contact- less measurements. Units after application of scale and offset are milli degrees Celsius.

---

/sys/bus/iio/devices/iio:deviceX/in_temp_thermocouple_type
--

---

Defined on file [sysfs-bus-iio](#)

One of the following thermocouple types: B, E, J, K, N, R, S, T.

---

/sys/bus/iio/devices/iio:deviceX/in_voltage2-voltage2_shorted_raw
---

---

Defined on file [sysfs-bus-iio-adc-ad7192](#)

Measure voltage from AIN2 pin connected to AIN(+) and AIN(-) shorted.

---

/sys/bus/iio/devices/iio:deviceX/in_voltageY-voltageZ_raw
---

---

Defined on file [sysfs-bus-iio](#)

Raw (unscaled) differential voltage measurement equivalent to channel Y - channel Z where these channel numbers apply to the physically equivalent inputs when non differential readings are separately available. In differential only parts, then all that is required is a consistent labeling. Units after application of scale and offset are millivolts.

---

```
/sys/bus/iio/devices/iio:deviceX/in_voltageY_calibscale
/sys/bus/iio/devices/iio:deviceX/in_voltageY_supply_calibscale
/sys/bus/iio/devices/iio:deviceX/in_voltageY_i_calibscale
/sys/bus/iio/devices/iio:deviceX/in_voltageY_q_calibscale
/sys/bus/iio/devices/iio:deviceX/in_voltage_i_calibscale
/sys/bus/iio/devices/iio:deviceX/in_voltage_q_calibscale
/sys/bus/iio/devices/iio:deviceX/in_voltage_calibscale

/sys/bus/iio/devices/iio:deviceX/in_pressureY_calibscale
/sys/bus/iio/devices/iio:deviceX/in_pressure_calibscale
/sys/bus/iio/devices/iio:deviceX/in_illuminance_calibscale
```

---

Defined on file [sysfs-bus-iio](#)

Hardware applied calibration scale factor (assumed to fix production inaccuracies). If shared across all channels, <type>\_calibscale is used.

---

```
/sys/bus/iio/devices/iio:deviceX/in_voltageY_raw
/sys/bus/iio/devices/iio:deviceX/in_voltageY_supply_raw
/sys/bus/iio/devices/iio:deviceX/in_voltageY_i_raw
/sys/bus/iio/devices/iio:deviceX/in_voltageY_q_raw
```

---

Defined on file [sysfs-bus-iio](#)

Raw (unscaled no bias removal etc.) voltage measurement from channel Y. In special cases where the channel does not correspond to externally available input one of the named versions may be used. The number must always be specified and unique to allow association with event codes. Units after application of scale and offset are millivolts.

Channels with ‘i’ and ‘q’ modifiers always exist in pairs and both channels refer to the same signal. The ‘i’ channel contains the in-phase component of the signal while the ‘q’ channel contains the quadrature component.

/sys/bus/iio/devices/iio:deviceX/in_intensity_y_scale
/sys/bus/iio/devices/iio:deviceX/in_intensity_z_scale

---

Defined on file [sysfs-bus-iio](#)

If known for a device, scale to be applied to <type>Y[\_name]\_raw post addition of <type>[Y][\_name]\_offset in order to obtain the measured value in <type> units as specified in <type>[Y][\_name]\_raw documentation. If shared across all in channels then Y and <x|y|z> are not present and the value is called <type>[Y][\_name]\_scale. The peak modifier means this value is applied to <type>Y[\_name]\_peak\_raw values.

---

/sys/bus/iio/devices/iio:deviceX/in_voltageY_sensing_mode
---

---

Defined on file [\*sysfs-bus-iio-adc-hi8435\*](#)

Program sensor type for threshold detector inputs. Could be either “GND-Open” or “Supply-Open” mode. Y is a threshold detector input channel. Channels 0..7, 8..15, 16..23 and 24..31 has common sensor types.

---

### **/sys/bus/iio/devices/iio:deviceX/in\_voltage\_spi\_clk\_freq**

---

Defined on file [\*sysfs-bus-iio-dfsm-adc-stm32\*](#)

For audio purpose only.

Used by audio driver to set/get the spi input frequency.

This is mandatory if DFSDM is slave on SPI bus, to provide information on the SPI clock frequency during runtime Notice that the SPI frequency should be a multiple of sample frequency to ensure the precision.

if DFSDM input is SPI master:

Reading SPI clkout frequency, error on writing

If DFSDM input is SPI Slave:

Reading returns value previously set. Writing value before starting conversions.

---

### **/sys/bus/iio/devices/iio:deviceX/in\_voltagex\_sys\_calibration**

---

Defined on file [\*sysfs-bus-iio-adc-ad7192\*](#)

Initiates the system calibration procedure. This is done on a single channel at a time. Write ‘1’ to start the calibration.

---

### **/sys/bus/iio/devices/iio:deviceX/in\_voltagex\_sys\_calibration\_mode**

---

Defined on file [\*sysfs-bus-iio-adc-ad7192\*](#)

Sets up the calibration mode used in the system calibration procedure. Reading returns the current calibration mode. Writing sets the system calibration mode.

---

### **/sys/bus/iio/devices/iio:deviceX/in\_voltagex\_sys\_calibration\_mode\_available**

---

Defined on file [\*sysfs-bus-iio-adc-ad7192\*](#)

Reading returns a list with the possible calibration modes. There are two available options: “zero\_scale” - calibrate to zero scale “full\_scale” - calibrate to full scale

---

### **/sys/bus/iio/devices/iio:deviceX/location**

---

Defined on file [\*sysfs-bus-iio-cros-ec\*](#)

This attribute returns a string with the physical location where the motion sensor is placed. For example, in a laptop a motion sensor can be located on the base or on the lid. Current valid values are ‘base’ and ‘lid’ .

<code>/sys/bus/iio/devices/iio:deviceX/meas_conf</code>
<code>/sys/bus/iio/devices/iio:deviceX/meas_conf_available</code>

Defined on file [sysfs-bus-iio-magnetometer-hmc5843](#)

Current configuration and available configurations for the bias current.

normal	Normal measurement configurations (default)
positive-bias	Positive bias configuration
negative-bias	Negative bias configuration
disabled	Only available on HMC5983. Disables magnetic sensor and enables temperature sensor.

#### Note:

The effect of this configuration may vary according to the device. For exact documentation check the device’ s datasheet.

<code>/sys/bus/iio/devices/iio:deviceX/mount_matrix</code>
<code>/sys/bus/iio/devices/iio:deviceX/in_mount_matrix</code>
<code>/sys/bus/iio/devices/iio:deviceX/out_mount_matrix</code>
<code>/sys/bus/iio/devices/iio:deviceX/in_anglvel_mount_matrix</code>
<code>/sys/bus/iio/devices/iio:deviceX/in_accel_mount_matrix</code>

Defined on file [sysfs-bus-iio](#)

Mounting matrix for IIO sensors. This is a rotation matrix which informs userspace about sensor chip’ s placement relative to the main hardware it is mounted on.

Main hardware placement is defined according to the local reference frame related to the physical quantity the sensor measures.

Given that the rotation matrix is defined in a board specific way (platform data and / or device-tree), the main hardware reference frame definition is left to the implementor’ s choice (see below for a magnetometer example).

Applications should apply this rotation matrix to samples so that when main hardware reference frame is aligned onto local reference frame, then sensor chip reference frame is also perfectly aligned with it.

Matrix is a 3x3 unitary matrix and typically looks like [0, 1, 0; 1, 0, 0; 0, 0, -1]. Identity matrix [1, 0, 0; 0, 1, 0; 0, 0, 1] means sensor chip and main hardware are perfectly aligned with each other.

For example, a mounting matrix for a magnetometer sensor informs userspace about sensor chip’ s ORIENTATION relative to the main hardware.

More specifically, main hardware orientation is defined with respect to the LOCAL EARTH GEOMAGNETIC REFERENCE FRAME where :

- Y is in the ground plane and positive towards magnetic North ;
- X is in the ground plane, perpendicular to the North axis and positive towards the East ;
- Z is perpendicular to the ground plane and positive upwards.

An implementor might consider that for a hand-held device, a ‘natural’ orientation would be ‘front facing camera at the top’. The main hardware reference frame could then be described as :

- Y is in the plane of the screen and is positive towards the top of the screen ;
- X is in the plane of the screen, perpendicular to Y axis, and positive towards the right hand side of the screen ;
- Z is perpendicular to the screen plane and positive out of the screen.

Another example for a quadrotor UAV might be :

- Y is in the plane of the propellers and positive towards the front-view camera;
- X is in the plane of the propellers, perpendicular to Y axis, and positive towards the starboard side of the UAV ;
- Z is perpendicular to propellers plane and positive upwards.

### **/sys/bus/iio/devices/iio:deviceX/name**

Defined on file [sysfs-bus-iio](#)

Description of the physical chip / device for device X. Typically a part number.

### **/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_frequency**

Defined on file [sysfs-bus-iio-frequency-adf4371](#)

Defined on file [sysfs-bus-iio](#)

Stores the PLL frequency in Hz for channel Y. Reading returns the actual frequency in Hz. The ADF4371 has an integrated VCO with fundamental output frequency ranging from 4000000000 Hz 8000000000 Hz.

#### **out\_altvoltage0\_frequency:**

A divide by 1, 2, 4, 8, 16, 32 or circuit generates frequencies from 62500000 Hz to 8000000000 Hz.

#### **out\_altvoltage1\_frequency:**

This channel duplicates the channel 0 frequency

#### **out\_altvoltage2\_frequency:**

A frequency doubler generates frequencies from 8000000000 Hz to 16000000000 Hz.

**out\_altvoltage3\_frequency:**

A frequency quadrupler generates frequencies from 16000000000 Hz to 32000000000 Hz.

Note: writes to one of the channels will affect the frequency of all the other channels, since it involves changing the VCO fundamental output frequency.

Output frequency for channel Y in Hz. The number must always be specified and unique if the output corresponds to a single channel.

**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_frequency\_increment**

Defined on file *sysfs-bus-iio-impedance-analyzer-ad5933*

Frequency increment in Hz (step size) between consecutive frequency points along the sweep.

**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_frequency\_points**

Defined on file *sysfs-bus-iio-impedance-analyzer-ad5933*

Number of frequency points (steps) in the frequency sweep. This value, in conjunction with the out\_altvoltageY\_frequency\_start and the out\_altvoltageY\_frequency\_increment, determines the frequency sweep range for the sweep operation.

**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_frequency\_resolution**

Defined on file *sysfs-bus-iio-frequency-adf4350*

Stores channel Y frequency resolution/channel spacing in Hz. The value given directly influences the MODULUS used by the fractional-N PLL. It is assumed that the algorithm that is used to compute the various dividers, is able to generate proper values for multiples of channel spacing.

**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_frequency\_start**

Defined on file *sysfs-bus-iio-impedance-analyzer-ad5933*

Frequency sweep start frequency in Hz.

**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_name**

Defined on file *sysfs-bus-iio-frequency-adf4371*

Reading returns the datasheet name for channel Y:

```
out_altvoltage0_name: RF8x
out_altvoltage1_name: RFAUX8x
```

(continues on next page)

(continued from previous page)

```
out_altvoltage2_name: RF16x  
out_altvoltage3_name: RF32x
```

---

**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_phase**

---

Defined on file [sysfs-bus-iio](#)

Phase in radians of one frequency/clock output Y (out\_altvoltageY) relative to another frequency/clock output (out\_altvoltageZ) of the device X. The number must always be specified and unique if the output corresponds to a single channel.

---

**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_powerdown**

---

Defined on file [sysfs-bus-iio-frequency-adf4371](#)

This attribute allows the user to power down the PLL and its RFOut buffers. Writing 1 causes the specified channel to power down. Clearing returns to normal operation.

---

**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_refin\_frequency**

---

Defined on file [sysfs-bus-iio-frequency-adf4350](#)

Sets channel Y REFin frequency in Hz. In some clock chained applications, the reference frequency used by the PLL may change during runtime. This attribute allows the user to adjust the reference frequency accordingly. The value written has no effect until out\_altvoltageY\_frequency is updated. Consider to use out\_altvoltageY\_powerdown to power down the PLL and its RFOut buffers during REFin changes.

---

**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_settling\_cycles**

---

Defined on file [sysfs-bus-iio-impedance-analyzer-ad5933](#)

Number of output excitation cycles (settling time cycles) that are allowed to pass through the unknown impedance, after each frequency increment, and before the ADC is triggered to perform a conversion sequence of the response signal.

---

**/sys/bus/iio/devices/iio:deviceX/out\_conversion\_mode**

---

Defined on file [sysfs-bus-iio-vf610](#)

Specifies the hardware conversion mode used within DAC. The two available modes are “high-power” and “low-power”, where “low-power” mode is the default mode.

---

**/sys/bus/iio/devices/iio:deviceX/out\_currentY\_currentZ\_raw**

---

Defined on file [sysfs-bus-iio-light-lm3533-als](#)

Set the output current for channel out\_currentY when in zone Z (0..255), where Y in 0..2 and Z in 0..4.

These values correspond to the ALS-mapper target registers for ALS-mapper Y + 1.

---

**/sys/bus/iio/devices/iio:deviceX/out\_currentY\_raw**

---

Defined on file [sysfs-bus-iio-light-lm3533-als](#)

Defined on file [sysfs-bus-iio-health-afe440x](#)

Get output current for channel Y (0..255), that is, out\_currentY\_currentZ\_raw, where Z is the current zone.

Get and set the LED current for the specified LED active during this stage. Y is the specific stage number.

---

**/sys/bus/iio/devices/iio:deviceX/out\_current\_heater\_raw**  
**/sys/bus/iio/devices/iio:deviceX/out\_current\_heater\_raw\_available**

---

Defined on file [sysfs-bus-iio-humidity-hdc2010](#)

Defined on file [sysfs-bus-iio-humidity-hdc100x](#)

Controls the heater device within the humidity sensor to get rid of excess condensation.

Valid control values are 0 = OFF, and 1 = ON. Controls the heater device within the humidity sensor to get rid of excess condensation.

Valid control values are 0 = OFF, and 1 = ON.

---

**/sys/bus/iio/devices/iio:deviceX/out\_resistance\_raw\_available**

---

Defined on file [sysfs-bus-iio-potentiometer-mcp4531](#)

The range of available values represented as the minimum value, the step and the maximum value, all enclosed in square brackets. Example: [0 1 256]

---

**/sys/bus/iio/devices/iio:deviceX/out\_voltageY&Z\_raw**  
**/sys/bus/iio/devices/iio:deviceX/out\_altvoltageY&Z\_raw**

---

Defined on file [sysfs-bus-iio](#)

Raw (unscaled, no bias etc.) output voltage for an aggregate of channel Y, channel Z, etc. This interface is available in cases where a single output sets the value for multiple channels simultaneously.

---

```
/sys/bus/iio/devices/iio:deviceX/out_voltageY_hardwaregain  
/sys/bus/iio/devices/iio:deviceX/in_intensity_hardwaregain  
/sys/bus/iio/devices/iio:deviceX/in_intensity_red_hardwaregain  
/sys/bus/iio/devices/iio:deviceX/in_intensity_green_hardwaregain  
/sys/bus/iio/devices/iio:deviceX/in_intensity_blue_hardwaregain  
/sys/bus/iio/devices/iio:deviceX/in_intensity_clear_hardwaregain
```

---

Defined on file [sysfs-bus-iio](#)

Hardware applied gain factor. If shared across all channels, <type>\_hardwaregain is used.

---

```
/sys/bus/iio/devices/iio:deviceX/out_voltageY_powerdown  
/sys/bus/iio/devices/iio:deviceX/out_voltage_powerdown  
/sys/bus/iio/devices/iio:deviceX/out_altvoltageY_powerdown  
/sys/bus/iio/devices/iio:deviceX/out_altvoltage_powerdown
```

---

Defined on file [sysfs-bus-iio](#)

Writing 1 causes output Y to enter the power down mode specified by the corresponding outY\_powerdown\_mode. DAC output stage is disconnected from the amplifier. Clearing returns to normal operation. Y may be suppressed if all outputs are controlled together.

---

```
/sys/bus/iio/devices/iio:deviceX/out_voltageY_powerdown_mode  
/sys/bus/iio/devices/iio:deviceX/out_voltage_powerdown_mode  
/sys/bus/iio/devices/iio:deviceX/out_altvoltageY_powerdown_mode  
/sys/bus/iio/devices/iio:deviceX/out_altvoltage_powerdown_mode
```

---

Defined on file [sysfs-bus-iio](#)

Specifies the output powerdown mode. DAC output stage is disconnected from the amplifier and 1kohm\_to\_gnd: connected to ground via an 1kOhm resistor, 2.5kohm\_to\_gnd: connected to ground via a 2.5kOhm resistor, 6kohm\_to\_gnd: connected to ground via a 6kOhm resistor, 20kohm\_to\_gnd: connected to ground via a 20kOhm resistor, 90kohm\_to\_gnd: connected to ground via a 90kOhm resistor, 100kohm\_to\_gnd: connected to ground via an 100kOhm resistor, 125kohm\_to\_gnd: connected to ground via an 125kOhm resistor, 500kohm\_to\_gnd: connected to ground via a 500kOhm resistor, 640kohm\_to\_gnd: connected to ground via a 640kOhm resistor, three\_state: left floating. For a list of available output power down options read outX\_powerdown\_mode\_available. If Y is not present the mode is shared across all outputs.

---

```
/sys/bus/iio/devices/iio:deviceX/out_voltageY_raw  
/sys/bus/iio/devices/iio:deviceX/out_altvoltageY_raw
```

---

Defined on file [sysfs-bus-iio](#)

Raw (unscaled, no bias etc.) output voltage for channel Y. The number must always be specified and unique if the output corresponds to a single channel. While DAC

like devices typically use out\_voltage, a continuous frequency generating device, such as a DDS or PLL should use out\_altvoltage.

---

**/sys/bus/iio/devices/iio:deviceX/out\_voltageY\_raw\_available**

---

Defined on file *sysfs-bus-iio-dac-dpot-dac*

The range of available values represented as the minimum value, the step and the maximum value, all enclosed in square brackets. Example: [0 1 256]

---

**/sys/bus/iio/devices/iio:deviceX/oversampling\_ratio**

---

Defined on file *sysfs-bus-iio*

Hardware dependent ADC oversampling. Controls the sampling ratio of the digital filter if available.

---

**/sys/bus/iio/devices/iio:deviceX/oversampling\_ratio\_available**

---

Defined on file *sysfs-bus-iio*

Hardware dependent values supported by the oversampling filter.

---

**/sys/bus/iio/devices/iio:deviceX/pll2\_feedback\_clk\_present  
/sys/bus/iio/devices/iio:deviceX/pll2\_reference\_clk\_present  
/sys/bus/iio/devices/iio:deviceX/pll1\_reference\_clk\_a\_present

/sys/bus/iio/devices/iio:deviceX/pll1\_reference\_clk\_test\_present  
/sys/bus/iio/devices/iio:deviceX/vcxo\_clk\_present**

---

Defined on file *sysfs-bus-iio-frequency-ad9523*

Reading returns either ‘1’ or ‘0’ .

‘1’ means that the clock in question is present.

‘0’ means that the clock is missing.

---

**/sys/bus/iio/devices/iio:deviceX/pllY\_locked**

---

Defined on file *sysfs-bus-iio-frequency-ad9523*

Reading returns either ‘1’ or ‘0’ . ‘1’ means that the pllY is locked.

---

**/sys/bus/iio/devices/iio:deviceX/proximity\_on\_chip\_ambient\_infrared\_suppression**

---

Defined on file *sysfs-bus-iio-light-isl29018*

From ISL29018 Data Sheet (FN6619.4, Oct 8, 2012) regarding the infrared suppression:

Scheme 0, makes full n (4, 8, 12, 16) bits (unsigned) proximity detection. The range of Scheme 0 proximity count is from 0 to  $2^n$ . Logic 1 of this bit, Scheme 1, makes n-1 (3, 7, 11, 15) bits (2's complementary) proximity\_less\_ambient detection. The range of Scheme 1 proximity count is from  $-2^{n-1}$  to  $2^{n-1}$ . The sign bit is extended for resolutions less than 16. While Scheme 0 has wider dynamic range, Scheme 1 proximity detection is less affected by the ambient IR noise variation.

0	Sensing IR from LED and ambient
1	Sensing IR from LED with ambient IR rejection

---

```
/sys/bus/iio/devices/iio:deviceX/sampling_frequency
/sys/bus/iio/devices/iio:deviceX/in_intensity_sampling_frequency
/sys/bus/iio/devices/iio:deviceX/buffer/sampling_frequency
/sys/bus/iio/devices/triggerX/sampling_frequency
```

---

Defined on file [sysfs-bus-iio](#)

Some devices have internal clocks. This parameter sets the resulting sampling frequency. In many devices this parameter has an effect on input filters etc. rather than simply controlling when the input is sampled. As this affects data ready triggers, hardware buffers and the sysfs direct access interfaces, it may be found in any of the relevant directories. If it affects all of the above then it is to be found in the base device directory.

---

```
/sys/bus/iio/devices/iio:deviceX/sampling_frequency_available
/sys/bus/iio/devices/iio:deviceX/in_intensity_sampling_frequency_available
/sys/bus/iio/devices/iio:deviceX/in_proximity_sampling_frequency_available
/sys/.../iio:deviceX/buffer/sampling_frequency_available
/sys/bus/iio/devices/triggerX/sampling_frequency_available
```

---

Defined on file [sysfs-bus-iio](#)

When the internal sampling clock can only take a specific set of frequencies, we can specify the available values with:

- a small discrete set of values like “0 2 4 6 8”
- a range with minimum, step and maximum frequencies like “[min step max]”

---

```
/sys/bus/iio/devices/iio:deviceX/scan_elements
```

---

Defined on file [sysfs-bus-iio](#)

Directory containing interfaces for elements that will be captured for a single triggered sample set in the buffer.

---

```
/sys/bus/iio/devices/iio:deviceX/sensor_max_range
```

---

Defined on file [sysfs-bus-iio-distance-srf08](#)

Show or set the maximum range between the sensor and the first object echoed in meters. Default value is 6.020. This setting limits the time the driver is waiting for a echo.

Showing the range of available values is represented as the minimum value, the step and the maximum value, all enclosed in square brackets.

Example:

```
[0.043 0.043 11.008]
```

---

**/sys/bus/iio/devices/iio:deviceX/sensor\_sensitivity**

Defined on file [sysfs-bus-iio-proximity-as3935](#)

Defined on file [sysfs-bus-iio-distance-srf08](#)

Show or set the gain boost of the amp, from 0-31 range. 18 = indoors (default) 14 = outdoors

What /sys/bus/iio/devices/iio:deviceX/noise\_level\_trippped When 1 the noise level is over the trip level and not reporting valid data Show or set the gain boost of the amp, from 0-31 range. default 31

---

**/sys/bus/iio/devices/iio:deviceX/start\_cleaning**

Defined on file [sysfs-bus-iio-sps30](#)

Writing 1 starts sensor self cleaning. Internal fan accelerates to its maximum speed and keeps spinning for about 10 seconds in order to blow out accumulated dust.

---

**/sys/bus/iio/devices/iio:deviceX/store\_eeprom**

Defined on file [sysfs-bus-iio](#)

Writing ‘1’ stores the current device configuration into on-chip EEPROM. After power-up or chip reset the device will automatically load the saved configuration.

---

**/sys/bus/iio/devices/iio:deviceX/sync\_dividers**

Defined on file [sysfs-bus-iio-frequency-ad9523](#)

Writing ‘1’ triggers the clock distribution synchronization functionality. All dividers are reset and the channels start with their predefined phase offsets (out\_altvoltageY\_phase). Writing this file has the effect as driving the external /SYNC pin low.

---

**/sys/bus/iio/devices/iio:deviceX/trigger/current\_trigger**

Defined on file [sysfs-bus-iio](#)

The name of the trigger source being used, as per string given in /sys/class/iio/triggerY/name.

### **/sys/bus/iio/devices/iio\_sysfs\_trigger/add\_trigger**

Defined on file *sysfs-bus-iio-trigger-sysfs*

This attribute is provided by the iio-trig-sysfs stand-alone driver and it is used to activate the creation of a new trigger. In order to achieve this, one should write a positive integer into the associated file, which will serve as the id of the trigger. If the trigger with the specified id is already present in the system, an invalid argument message will be returned.

### **/sys/bus/iio/devices/iio\_sysfs\_trigger/remove\_trigger**

Defined on file *sysfs-bus-iio-trigger-sysfs*

This attribute is used to unregister and delete a previously created trigger from the list of available triggers. In order to achieve this, one should write a positive integer into the associated file, representing the id of the trigger that needs to be removed. If the trigger can't be found, an invalid argument message will be returned to the user.

### **/sys/bus/iio/devices/triggerX**

Defined on file *sysfs-bus-iio*

An event driven driver of data capture to an in kernel buffer. May be provided by a device driver that also has an IIO device based on hardware generated events (e.g. data ready) or provided by a separate driver for other hardware (e.g. periodic timer, GPIO or high resolution timer).

Contains trigger type specific elements. These do not generalize well and hence are not documented in this file. X is the IIO index of the trigger.

### **/sys/bus/iio/devices/triggerX/master\_mode**

Defined on file *sysfs-bus-iio-timer-stm32*

Reading returns the current master modes. Writing set the master mode

### **/sys/bus/iio/devices/triggerX/master\_mode\_available**

Defined on file *sysfs-bus-iio-timer-stm32*

Reading returns the list possible master modes which are:

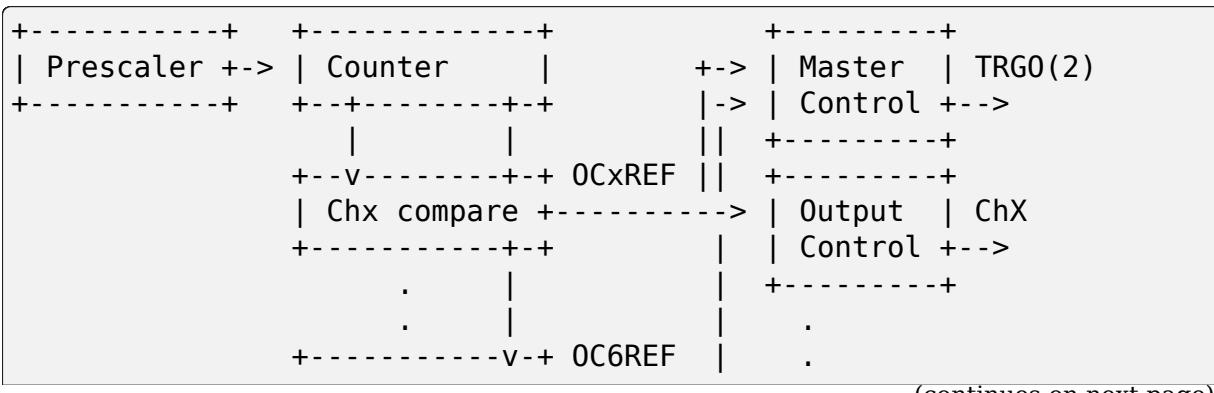

- “reset”

The UG bit from the TIMx\_EGR register is used as trigger output (TRGO).

- “**enable**”  
The Counter Enable signal CNT\_EN is used as trigger output.
- “**update**”  
The update event is selected as trigger output. For instance a master timer can then be used as a prescaler for a slave timer.
- “**compare\_pulse**”  
The trigger output send a positive pulse when the CC1IF flag is to be set.
- “**OC1REF**”  
OC1REF signal is used as trigger output.
- “**OC2REF**”  
OC2REF signal is used as trigger output.
- “**OC3REF**”  
OC3REF signal is used as trigger output.
- “**OC4REF**”  
OC4REF signal is used as trigger output.

Additional modes (on TRGO2 only):

- “**OC5REF**”  
OC5REF signal is used as trigger output.
- “**OC6REF**”  
OC6REF signal is used as trigger output.
- “**compare\_pulse\_OC4REF**” :  
OC4REF rising or falling edges generate pulses.
- “**compare\_pulse\_OC6REF**” :  
OC6REF rising or falling edges generate pulses.
- “**compare\_pulse\_OC4REF\_r\_or\_OC6REF\_r**” :  
OC4REF or OC6REF rising edges generate pulses.
- “**compare\_pulse\_OC4REF\_r\_or\_OC6REF\_f**” :  
OC4REF rising or OC6REF falling edges generate pulses.
- “**compare\_pulse\_OC5REF\_r\_or\_OC6REF\_r**” :  
OC5REF or OC6REF rising edges generate pulses.
- “**compare\_pulse\_OC5REF\_r\_or\_OC6REF\_f**” :  
OC5REF rising or OC6REF falling edges generate pulses.

(continued from previous page)

TRG02	
	++ +---+ +-----+

### **/sys/bus/iio/devices/triggerX/name**

Defined on file [sysfs-bus-iio-trigger-sysfs](#)

The name attribute holds a description string for the current trigger. In order to associate the trigger with an IIO device one should write this name string to /sys/bus/iio/devices/iio:deviceY/trigger/current\_trigger.

### **/sys/bus/iio/devices/triggerX/name = “adxl372-devX-peak”**

Defined on file [sysfs-bus-iio-accel-adxl372](#)

The adxl372 accelerometer kernel module provides an additional trigger, which sets the device in a mode in which it will record only the peak acceleration sensed over the set period of time in the events sysfs.

### **/sys/bus/iio/devices/triggerX/name = “bmc150\_accel-any-motion-devX”**

Defined on file [sysfs-bus-iio-accel-bmc150](#)

The BMC150 accelerometer kernel module provides an additional trigger, which sets driver in a mode, where data is pushed to the buffer only when there is any motion.

### **/sys/bus/iio/devices/triggerX/name = “bmg160-any-motion-devX”**

Defined on file *sysfs-bus-iio-gyro-bmg160*

The BMG160 gyro kernel module provides an additional trigger, which sets driver in a mode, where data is pushed to the buffer only when there is any motion.

---

**/sys/bus/iio/devices/triggerX/sampling\_frequency**

---

Defined on file *sysfs-bus-iio-timer-stm32*

Reading returns the current sampling frequency. Writing an value different of 0 set and start sampling. Writing 0 stop sampling.

---

**/sys/bus/iio/devices/triggerX/trigger\_now**

---

Defined on file *sysfs-bus-iio-trigger-sysfs*

This file is provided by the iio-trig-sysfs stand-alone trigger driver. Writing this file with any value triggers an event driven driver, associated with this trigger, to capture data into an in kernel buffer. This approach can be valuable during automated testing or in situations, where other trigger methods are not applicable. For example no RTC or spare GPIOs. X is the IIO index of the trigger.

---

**/sys/bus/iio/devices/triggerX/trigger\_polarity**

---

Defined on file *sysfs-bus-iio-adc-stm32*

The STM32 ADC can be configured to use external trigger sources (e.g. timers, pwm or exti gpio). Then, it can be tuned to start conversions on external trigger by either:

- “rising-edge”
- “falling-edge”
- “both-edges” .

Reading returns current trigger polarity.

Writing value before enabling conversions sets trigger polarity.

---

**/sys/bus/iio/devices/triggerX/trigger\_polarity\_available**

---

Defined on file *sysfs-bus-iio-adc-stm32*

List all available trigger\_polarity settings.

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-<device><id>/active**

---

Defined on file *sysfs-bus-intel\_th-output-devices*

(RW) Writes of 1 or 0 enable or disable trace output to this output device. Reads return current status. Requires that the corresponding output port driver be loaded.

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-gth/masters/\***

---

Defined on file *sysfs-bus-intel\_th-devices-gth*

(RW) Configure output ports for STP masters. Writing -1 disables a master; any

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-gth/outputs/[0-7]\_drop**

---

Defined on file *sysfs-bus-intel\_th-devices-gth*

(RW) Data retention policy setting: keep (0) or drop (1) incoming data while output port is in reset.

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-gth/outputs/[0-7]\_flush**

---

Defined on file *sysfs-bus-intel\_th-devices-gth*

(RW) Force flush data from byte packing buffer for the output port.

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-gth/outputs/[0-7]\_null**

---

Defined on file *sysfs-bus-intel\_th-devices-gth*

(RW) STP NULL packet generation: enabled (1) or disabled (0).

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-gth/outputs/[0-7]\_port**

---

Defined on file *sysfs-bus-intel\_th-devices-gth*

(RO) Output port type:

---

0	not present,
1	MSU (Memory Storage Unit)
2	CTP (Common Trace Port)
4	PTI (MIPI PTI).

---

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-gth/outputs/[0-7]\_reset**

---

Defined on file *sysfs-bus-intel\_th-devices-gth*

(RO) Output port is in reset (1).

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-gth/outputs/[0-7]\_smcfreq**

---

Defined on file *sysfs-bus-intel\_th-devices-gth*

(RW) STP sync packet frequency for the port. Specifies the number of clocks between mainenance packets.

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-msc<msc-id>/mode**

---

Defined on file *sysfs-bus-intel\_th-devices-msc*

(RW) Configure MSC operating mode:

- “single” , for contiguous buffer mode (high-order alloc);
- “multi” , for multiblock mode;
- “ExI” , for DCI handler mode;
- “debug” , for debug mode;
- any of the currently loaded buffer sinks.

If operating mode changes, existing buffer is deallocated, provided there are no active users and tracing is not enabled, otherwise the write will fail.

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-msc<msc-id>/nr\_pages**

---

Defined on file *sysfs-bus-intel\_th-devices-msc*

(RW) Configure MSC buffer size for “single” or “multi” modes.

In single mode, this is a single number of pages, has to be power of 2. In multiblock mode, this is a comma-separated list of numbers of pages for each window to be allocated. Number of windows is not limited.

Writing to this file deallocates existing buffer (provided there are no active users and tracing is not enabled) and then allocates a new one.

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-msc<msc-id>/port**

---

Defined on file *sysfs-bus-intel\_th-output-devices*

(RO) Port number, corresponding to this output device on the switch (GTH) or “unassigned” if the correspoding output port driver is not loaded.

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-msc<msc-id>/stop\_on\_full**

---

Defined on file *sysfs-bus-intel\_th-devices-msc*

(RW) Configure whether trace stops when the last available window becomes full (1/y/Y) or wraps around and continues until the next window becomes available again (0/n/N).

---

**/sys/bus/intel\_th/devices/<intel\_th\_id>-msc<msc-id>/win\_switch**

---

Defined on file *sysfs-bus-intel\_th-devices-msc*

(RW) Trigger window switch for the MSC’s buffer, in multi-window mode. In “multi” mode, accepts writes of “1”, thereby triggering a window switch for the buffer. Returns an error in any other operating mode or attempts to write something other than “1”.

---

### **/sys/bus/intel\_th/devices/<intel\_th\_id>-msc<msc-id>/wrap**

---

Defined on file *sysfs-bus-intel\_th-devices-msc*

(RW) Configure MSC buffer wrapping. 1 == wrapping enabled.

---

### **/sys/bus/intel\_th/devices/<intel\_th\_id>-pti/clock\_divider**

---

Defined on file *sysfs-bus-intel\_th-devices-pti*

**(RW) Configure PTI port clock divider:**

- 0: Intel TH clock rate,
- 1: 1/2 Intel TH clock rate,
- 2: 1/4 Intel TH clock rate,
- 3: 1/8 Intel TH clock rate.

---

### **/sys/bus/intel\_th/devices/<intel\_th\_id>-pti/freerunning\_clock**

---

Defined on file *sysfs-bus-intel\_th-devices-pti*

(RW) 0: PTI trace clock acts as a strobe which only toggles when there is trace data to send. 1: PTI trace clock is a free-running clock.

---

### **/sys/bus/intel\_th/devices/<intel\_th\_id>-pti/mode**

---

Defined on file *sysfs-bus-intel\_th-devices-pti*

(RW) Configure PTI output width. Currently supported values are 4, 8, 12, 16.

---

### **/sys/bus/mcb/devices/mcb:X**

---

Defined on file *sysfs-bus-mcb*

Hardware chip or device hosting the MEN chameleon bus

---

### **/sys/bus/mcb/devices/mcb:X/minor**

---

Defined on file *sysfs-bus-mcb*

The FPGA’ s minor number

**/sys/bus/mcb/devices/mcb:X/model**

Defined on file *sysfs-bus-mcb*

The FPGA's model number

**/sys/bus/mcb/devices/mcb:X/name**

Defined on file *sysfs-bus-mcb*

The FPGA's name

**/sys/bus/mcb/devices/mcb:X/revision**

Defined on file *sysfs-bus-mcb*

The FPGA's revision number

**/sys/bus/mdio\_bus/devices/…/statistics/**

Defined on file *sysfs-bus-mdio*

This folder contains statistics about global and per MDIO bus address statistics.

**/sys/bus/mdio\_bus/devices/…/statistics/errors**

Defined on file *sysfs-bus-mdio*

Total number of transfer errors for this MDIO bus.

**/sys/bus/mdio\_bus/devices/…/statistics/errors\_<addr>**

Defined on file *sysfs-bus-mdio*

Total number of transfer errors for this MDIO bus address.

**/sys/bus/mdio\_bus/devices/…/statistics/reads**

Defined on file *sysfs-bus-mdio*

Total number of read transactions for this MDIO bus.

**/sys/bus/mdio\_bus/devices/…/statistics/reads\_<addr>**

Defined on file *sysfs-bus-mdio*

Total number of read transactions for this MDIO bus address.

### **/sys/bus/mdio\_bus/devices/…/statistics/transfers**

Defined on file *sysfs-bus-mdio*

Total number of transfers for this MDIO bus.

### **/sys/bus/mdio\_bus/devices/…/statistics/transfers\_<addr>**

Defined on file *sysfs-bus-mdio*

Total number of transfers for this MDIO bus address.

### **/sys/bus/mdio\_bus/devices/…/statistics/writes**

Defined on file *sysfs-bus-mdio*

Total number of write transactions for this MDIO bus.

### **/sys/bus/mdio\_bus/devices/…/statistics/writes\_<addr>**

Defined on file *sysfs-bus-mdio*

Total number of write transactions for this MDIO bus address.

### **/sys/bus/media/devices/…/model**

Defined on file *sysfs-bus-media*

Contains the device model name in UTF-8. The device version is not be appended to the model name.

### **/sys/bus/mei/devices/…/fixed**

Defined on file *sysfs-bus-meい*

Stores mei client fixed address, if any Format: %d

### **/sys/bus/mei/devices/…/max\_conn**

Defined on file *sysfs-bus-meい*

Stores mei client maximum number of connections Format: %d

### **/sys/bus/mei/devices/…/max\_len**

Defined on file *sysfs-bus-meい*

Stores mei client maximum message length Format: %d

### /sys/bus/mei/devices/…/modalias

Defined on file *sysfs-bus-meい*

Stores the same MODALIAS value emitted by uevent Format: mei:<mei device name>:<device uuid>:<protocol version>

### /sys/bus/mei/devices/…/name

Defined on file *sysfs-bus-meい*

Stores mei client device name Format: string

### /sys/bus/mei/devices/…/uuid

Defined on file *sysfs-bus-meい*

Stores mei client device uuid Format: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx

### /sys/bus/mei/devices/…/version

Defined on file *sysfs-bus-meい*

Stores mei client protocol version Format: %d

### /sys/bus/mei/devices/…/vtag

Defined on file *sysfs-bus-meい*

Stores mei client vtag support status Format: %d

### /sys/bus/mmc/devices/…/rev

Defined on file *sysfs-bus-mmc*

Extended CSD revision number

### /sys/bus/most/devices/<dev>/<channel>/

Defined on file *sysfs-bus-most*

For every channel of the device a directory is created, whose name is dictated by the HDM. This enables an application to collect information about the channel's capabilities and configure it.

### /sys/bus/most/devices/<dev>/<channel>/available\_datatypes

Defined on file *sysfs-bus-most*

Indicates the data types the channel can transport.

---

### **/sys/bus/most/devices/<dev>/<channel>/available\_directions**

---

Defined on file *sysfs-bus-most*

Indicates the directions the channel is capable of.

---

### **/sys/bus/most/devices/<dev>/<channel>/channel\_starving**

---

Defined on file *sysfs-bus-most*

Indicates whether channel ran out of buffers.

---

### **/sys/bus/most/devices/<dev>/<channel>/number\_of\_packet\_buffers**

---

Defined on file *sysfs-bus-most*

Indicates the number of packet buffers the channel can handle.

---

### **/sys/bus/most/devices/<dev>/<channel>/number\_of\_stream\_buffers**

---

Defined on file *sysfs-bus-most*

Indicates the number of streaming buffers the channel can handle.

---

### **/sys/bus/most/devices/<dev>/<channel>/set\_buffer\_size**

---

Defined on file *sysfs-bus-most*

This is to read back the configured buffer size of the channel.

---

### **/sys/bus/most/devices/<dev>/<channel>/set\_datatype**

---

Defined on file *sysfs-bus-most*

This is to read back the configured data type of the channel. The following strings will be accepted:

```
'control',
'async',
'sync',
'isoc_avp'
```

---

### **/sys/bus/most/devices/<dev>/<channel>/set\_direction**

---

Defined on file *sysfs-bus-most*

This is to read back the configured direction of the channel. The following strings will be accepted:

```
'tx',  
'rx'
```

---

**/sys/bus/most/devices/<dev>/<channel>/set\_number\_of\_buffers**

---

Defined on file *sysfs-bus-most*

This is to read back the configured number of buffers of the channel.

---

**/sys/bus/most/devices/<dev>/<channel>/set\_packets\_per\_xact**

---

Defined on file *sysfs-bus-most*

This is to read back the configured number of packets per transaction of the channel. This is only applicable when connected via USB.

---

**/sys/bus/most/devices/<dev>/<channel>/set\_subbuffer\_size**

---

Defined on file *sysfs-bus-most*

This is to read back the configured subbuffer size of the channel.

---

**/sys/bus/most/devices/<dev>/<channel>/size\_of\_packet\_buffer**

---

Defined on file *sysfs-bus-most*

Indicates the size of a packet buffer the channel can handle.

---

**/sys/bus/most/devices/<dev>/<channel>/size\_of\_stream\_buffer**

---

Defined on file *sysfs-bus-most*

Indicates the size of a streaming buffer the channel can handle.

---

**/sys/bus/most/devices/<dev>/dci**

---

Defined on file *sysfs-bus-most*

If the network interface controller is attached via USB, a dci directory is created that allows applications to read and write the controller's DCI registers.

---

**/sys/bus/most/devices/<dev>/dci/arb\_address**

---

Defined on file *sysfs-bus-most*

This is used to set an arbitrary DCI register address an application wants to read from or write to.

---

**/sys/bus/most/devices/<dev>/dci/arb\_value**

---

Defined on file *sysfs-bus-most*

This is used to read and write the DCI register whose address is stored in arb\_address.

---

**/sys/bus/most/devices/<dev>/dci/mep\_eui48\_hi**

---

Defined on file *sysfs-bus-most*

This is used to check and configure the MAC address.

---

**/sys/bus/most/devices/<dev>/dci/mep\_eui48\_lo**

---

Defined on file *sysfs-bus-most*

This is used to check and configure the MAC address.

---

**/sys/bus/most/devices/<dev>/dci/mep\_eui48\_mi**

---

Defined on file *sysfs-bus-most*

This is used to check and configure the MAC address.

---

**/sys/bus/most/devices/<dev>/dci/mep\_filter**

---

Defined on file *sysfs-bus-most*

This is used to check and configure the MEP filter address.

---

**/sys/bus/most/devices/<dev>/dci/mep\_hash0**

---

Defined on file *sysfs-bus-most*

This is used to check and configure the MEP hash table.

---

**/sys/bus/most/devices/<dev>/dci/mep\_hash1**

---

Defined on file *sysfs-bus-most*

This is used to check and configure the MEP hash table.

---

**/sys/bus/most/devices/<dev>/dci/mep\_hash2**

---

Defined on file *sysfs-bus-most*

This is used to check and configure the MEP hash table.

**/sys/bus/most/devices/<dev>/dci/mep\_hash3**

Defined on file *sysfs-bus-most*

This is used to check and configure the MEP hash table.

**/sys/bus/most/devices/<dev>/dci/ni\_state**

Defined on file *sysfs-bus-most*

Indicates the current network interface state.

**/sys/bus/most/devices/<dev>/dci/node\_address**

Defined on file *sysfs-bus-most*

Indicates the current node address.

**/sys/bus/most/devices/<dev>/dci/node\_position**

Defined on file *sysfs-bus-most*

Indicates the current node position.

**/sys/bus/most/devices/<dev>/dci/packet\_bandwidth**

Defined on file *sysfs-bus-most*

Indicates the configured packet bandwidth.

**/sys/bus/most/devices/<dev>/dci/sync\_ep**

Defined on file *sysfs-bus-most*

Triggers the controller's synchronization process for a certain endpoint.

**/sys/bus/most/devices/<dev>/description**

Defined on file *sysfs-bus-most*

Provides information about the physical location of the device. Hardware attached via USB, for instance, might return <1-1.1:1.0>

**/sys/bus/most/devices/<dev>/interface**

Defined on file *sysfs-bus-most*

Indicates the type of peripheral interface the device uses.

---

**/sys/bus/most/drivers/most\_core/components**

---

Defined on file *sysfs-bus-most*

This is used to retrieve a list of registered components.

---

**/sys/bus/most/drivers/most\_core/links**

---

Defined on file *sysfs-bus-most*

This is used to retrieve a list of established links.

---

**/sys/bus/moxtet/devices/moxtet-<name>.<addr>/module\_description**

---

Defined on file *sysfs-bus-moxtet-devices*

(Read) Moxtet module description. Format: string

---

**/sys/bus/moxtet/devices/moxtet-<name>.<addr>/module\_id**

---

Defined on file *sysfs-bus-moxtet-devices*

(Read) Moxtet module ID. Format: %x

---

**/sys/bus/moxtet/devices/moxtet-<name>.<addr>/module\_name**

---

Defined on file *sysfs-bus-moxtet-devices*

(Read) Moxtet module name. Format: string

---

**/sys/bus/nd/devices/ndbusX/nfit/dsm\_mask**

---

Defined on file *sysfs-bus-nfit*

(RO) The bitmask indicates the supported bus specific control functions. See the section named ‘NVDIMM Root Device \_DSMs’ in the ACPI specification.

---

**/sys/bus/nd/devices/ndbusX/nfit/firmware\_activate\_nidle**

---

Defined on file *sysfs-bus-nfit*

(RW) The Intel platform implementation of firmware activate support exposes an option let the platform force idle devices in the system over the activation event, or trust that the OS will do it. The safe default is to let the platform force idle devices since the kernel is already in a suspend state, and on the chance that a driver

does not properly quiesce bus-mastering after a suspend callback the platform will handle it. However, the activation might abort if, for example, platform firmware determines that the activation time exceeds the max PCI-E completion timeout. Since the platform does not know whether the OS is running the activation from a suspend context it aborts, but if the system owner trusts driver suspend callback to be sufficient then ‘firmware\_activation\_noidle’ can be enabled to bypass the activation abort.

---

**/sys/bus/nd/devices/ndbusX/nfit/hw\_error\_scrub**

Defined on file *sysfs-bus-nfit*

(RW) Provides a way to toggle the behavior between just adding the address (cache line) where the MCE happened to the poison list and doing a full scrub. The former (selective insertion of the address) is done unconditionally.

This attribute can have the following values written to it:

‘0’ : Switch to the default mode where an exception will only insert the address of the memory error into the poison and badblocks lists. ‘1’ : Enable a full scrub to happen if an exception for a memory error is received.

---

**/sys/bus/nd/devices/ndbusX/nfit/revision**

Defined on file *sysfs-bus-nfit*

(RO) ACPI NFIT table revision number.

---

**/sys/bus/nd/devices/ndbusX/nfit/scrub**

Defined on file *sysfs-bus-nfit*

(RW) This shows the number of full Address Range Scrubs (ARS) that have been completed since driver load time. Userspace can wait on this using select/poll etc. A ‘+’ at the end indicates an ARS is in progress

Writing a value of 1 triggers an ARS scan.

---

**/sys/bus/nd/devices/nmemX/nfit/device**

Defined on file *sysfs-bus-nfit*

(RO) Device id for the NVDIMM, assigned by the module vendor.

---

**/sys/bus/nd/devices/nmemX/nfit/dsm\_mask**

Defined on file *sysfs-bus-nfit*

(RO) The bitmask indicates the supported device specific control functions relative to the NVDIMM command family supported by the device

### /sys/bus/nd/devices/nmemX/nfit/family

Defined on file *sysfs-bus-nfit*

(RO) Displays the NVDIMM family command sets. Values 0, 1, 2 and 3 correspond to NVDIMM\_FAMILY\_INTEL, NVDIMM\_FAMILY\_HPE1, NVDIMM\_FAMILY\_HPE2 and NVDIMM\_FAMILY\_MSFT respectively.

See the specifications for these command families here: [http://pmem.io/documents/NVDIMM\\_DSM\\_Interface-V1.6.pdf](http://pmem.io/documents/NVDIMM_DSM_Interface-V1.6.pdf) <https://github.com/HewlettPackard/hpe-nvm/blob/master/Documentation/> <https://msdn.microsoft.com/library/windows/hardware/mt604741>

### /sys/bus/nd/devices/nmemX/nfit/flags

Defined on file *sysfs-bus-nfit*

(RO) The flags in the NFIT memory device sub-structure indicate the state of the data on the nvdimm relative to its energy source or last “flush to persistence” .

The attribute is a translation of the ‘NVDIMM State Flags’ field in section 5.2.25.3 ‘NVDIMM Region Mapping’ Structure of the ACPI specification 6.2.

The health states are “save\_fail”, “restore\_fail”, “flush\_fail”, “not\_armed”, “smart\_event”, “map\_fail” and “smart\_notify” .

### /sys/bus/nd/devices/nmemX/nfit/format /sys/bus/nd/devices/nmemX/nfit/format1 /sys/bus/nd/devices/nmemX/nfit/formats

Defined on file *sysfs-bus-nfit*

(RO) The interface codes indicate support for persistent memory mapped directly into system physical address space and / or a block aperture access mechanism to the NVDIMM media. The ‘formats’ attribute displays the number of supported interfaces.

This layout is compatible with existing libndctl binaries that only expect one code per-dimm as they will ignore nmemX/nfit/formats and nmemX/nfit/formatN.

### /sys/bus/nd/devices/nmemX/nfit/handle

Defined on file *sysfs-bus-nfit*

(RO) The address (given by the \_ADR object) of the device on its parent bus of the NVDIMM device containing the NVDIMM region.

### /sys/bus/nd/devices/nmemX/nfit/id

Defined on file *sysfs-bus-nfit*

(RO) ACPI specification 6.2 section 5.2.25.9, defines an identifier for an NVDIMM, which refelects the id attribute.

---

**/sys/bus/nd/devices/nmemX/nfit/phys\_id**

---

Defined on file *sysfs-bus-nfit*

(RO) Handle (i.e., instance number) for the SMBIOS (system management BIOS) Memory Device structure describing the NVDIMM containing the NVDIMM region.

---

**/sys/bus/nd/devices/nmemX/nfit/rev\_id**

---

Defined on file *sysfs-bus-nfit*

(RO) Revision of the NVDIMM, assigned by the module vendor.

---

**/sys/bus/nd/devices/nmemX/nfit/serial**

---

Defined on file *sysfs-bus-nfit*

(RO) Serial number of the NVDIMM (non-volatile dual in-line memory module), assigned by the module vendor.

---

**/sys/bus/nd/devices/nmemX/nfit/subsystem\_device**

---

Defined on file *sysfs-bus-nfit*

(RO) Sub-system device id for the NVDIMM non-volatile memory subsystem controller, assigned by the non-volatile memory subsystem controller vendor.

---

**/sys/bus/nd/devices/nmemX/nfit/subsystem\_rev\_id**

---

Defined on file *sysfs-bus-nfit*

(RO) Sub-system revision id of the NVDIMM non-volatile memory subsystem controller, assigned by the non-volatile memory subsystem controller vendor.

---

**/sys/bus/nd/devices/nmemX/nfit/subsystem\_vendor**

---

Defined on file *sysfs-bus-nfit*

(RO) Sub-system vendor id of the NVDIMM non-volatile memory subsystem controller.

---

**/sys/bus/nd/devices/nmemX/nfit/vendor**

---

Defined on file *sysfs-bus-nfit*

(RO) Vendor id of the NVDIMM.

### /sys/bus/nd/devices/nmemX/papr/flags

Defined on file *sysfs-bus-papr-pmem*

(RO) Report flags indicating various states of a papr-pmem NVDIMM device. Each flag maps to a one or more bits set in the dimm-health-bitmap retrieved in response to H\_SCM\_HEALTH hcall. The details of the bit flags returned in response to this hcall is available at ‘/powerpc/papr\_hcalls’ . Below are the flags reported in this sysfs file:

- “**not\_armed**”  
Indicates that NVDIMM contents will not survive a power cycle.
- “**flush\_fail**”  
Indicates that NVDIMM contents couldn’t be flushed during last shutdown event.
- “**restore\_fail**”  
Indicates that NVDIMM contents couldn’t be restored during NVDIMM initialization.
- “**encrypted**”  
NVDIMM contents are encrypted.
- “**smart\_notify**”  
There is health event for the NVDIMM.
- “**scrubbed**”  
Indicating that contents of the NVDIMM have been scrubbed.
- “**locked**”  
Indicating that NVDIMM contents cant be modified until next power cycle.

### /sys/bus/nd/devices/nmemX/papr/perf\_stats

Defined on file *sysfs-bus-papr-pmem*

(RO) Report various performance stats related to papr-scm NVDIMM device. This attribute is only available for NVDIMM devices that support reporting NVDIMM performance stats. Each stat is reported on a new line with each line composed of a stat-identifier followed by its value. Below are currently known dimm performance stats which are reported:

- “CtlResCt” : Controller Reset Count
- “CtlResTm” : Controller Reset Elapsed Time
- “PonSecs” : Power-on Seconds
- “MemLife” : Life Remaining
- “CritRscU” : Critical Resource Utilization
- “HostLCnt” : Host Load Count

- “HostSCnt” : Host Store Count
- “HostSDur” : Host Store Duration
- “HostLDur” : Host Load Duration
- “MedRCnt” : Media Read Count
- “MedWCnt” : Media Write Count
- “MedRDur” : Media Read Duration
- “MedWDur” : Media Write Duration
- “CchRHCnt” : Cache Read Hit Count
- “CchWHCnt” : Cache Write Hit Count
- “FastWCnt” : Fast Write Count

---

**/sys/bus/nd/devices/regionX/nfit/range\_index**

---

Defined on file *sysfs-bus-nfit*

(RO) A unique number provided by the BIOS to identify an address range. Used by NVDIMM Region Mapping Structure to uniquely refer to this structure. Value of 0 is reserved and not used as an index.

---

**/sys/bus/pci/devices/…/acpi\_index**

---

Defined on file *sysfs-bus-pci*

Reading this attribute will provide the firmware given instance (ACPI \_DSM instance number) of the PCI device. The attribute will be created only if the firmware has given an instance number to the PCI device. ACPI \_DSM instance number will be given priority if the system firmware provides SMBIOS type 41 device type instance also.

Users:

Userspace applications interested in knowing the firmware assigned instance number of the PCI device that can help in understanding the firmware intended order of the PCI device.

---

**/sys/bus/pci/devices/…/d3cold\_allowed**

---

Defined on file *sysfs-bus-pci*

d3cold\_allowed is bit to control whether the corresponding PCI device can be put into D3Cold state. If it is cleared, the device will never be put into D3Cold state. If it is set, the device may be put into D3Cold state if other requirements are satisfied too. Reading this attribute will show the current value of d3cold\_allowed bit. Writing this attribute will set the value of d3cold\_allowed bit.

### **/sys/bus/pci/devices/…/dep\_link**

Defined on file *sysfs-bus-pci*

This symbolic link appears when hardware supports the SR-IOV capability and the Physical Function driver has enabled it, and this device has vendor specific dependencies with others. The symbolic link points to the PCI device sysfs entry of Physical Function this device depends on.

### **/sys/bus/pci/devices/…/driver\_override**

Defined on file *sysfs-bus-pci*

This file allows the driver for a device to be specified which will override standard static and dynamic ID matching. When specified, only a driver with a name matching the value written to `driver_override` will have an opportunity to bind to the device. The override is specified by writing a string to the `driver_override` file (`echo pci-stub > driver_override`) and may be cleared with an empty string (`echo > driver_override`). This returns the device to standard matching rules binding. Writing to `driver_override` does not automatically unbind the device from its current driver or make any attempt to automatically load the specified driver. If no driver with a matching name is currently loaded in the kernel, the device will not bind to any driver. This also allows devices to opt-out of driver binding using a `driver_override` name such as “`none`”. Only a single driver may be specified in the override, there is no support for parsing delimiters.

### **/sys/bus/pci/devices/…/index**

Defined on file *sysfs-bus-pci*

Reading this attribute will provide the firmware given instance (SMBIOS type 41 device type instance) of the PCI device. The attribute will be created only if the firmware has given an instance number to the PCI device.

Users:

Userspace applications interested in knowing the firmware assigned device type instance of the PCI device that can help in understanding the firmware intended order of the PCI device.

### **/sys/bus/pci/devices/…/label**

Defined on file *sysfs-bus-pci*

Reading this attribute will provide the firmware given name (SMBIOS type 41 string or ACPI \_DSM string) of the PCI device. The attribute will be created only if the firmware has given a name to the PCI device. ACPI \_DSM string name will be given priority if the system firmware provides SMBIOS type 41 string also.

Users:

Userspace applications interested in knowing the firmware assigned name of the PCI device.

**/sys/bus/pci/devices/…/link/clkpm**

Defined on file *sysfs-bus-pci*

If ASPM is supported for an endpoint, these files can be used to disable or enable the individual power management states. Write y/1/on to enable, n/0/off to disable.

**/sys/bus/pci/devices/…/msi\_bus**

Defined on file *sysfs-bus-pci*

Writing a zero value to this attribute disallows MSI and MSI-X for any future drivers of the device. If the device is a bridge, MSI and MSI-X will be disallowed for future drivers of all child devices under the bridge. Drivers must be reloaded for the new setting to take effect.

**/sys/bus/pci/devices/…/msi\_irqs/**

Defined on file *sysfs-bus-pci*

The /sys/devices/…/msi\_irqs directory contains a variable set of files, with each file being named after a corresponding msi irq vector allocated to that device.

**/sys/bus/pci/devices/…/msi\_irqs/<N>**

Defined on file *sysfs-bus-pci*

This attribute indicates the mode that the irq vector named by the file is in (msi vs. msix)

**/sys/bus/pci/devices/…/numa\_node**

Defined on file *sysfs-bus-pci*

This file contains the NUMA node to which the PCI device is attached, or -1 if the node is unknown. The initial value comes from an ACPI \_PXM method or a similar firmware source. If that is missing or incorrect, this file can be written to override the node. In that case, please report a firmware bug to the system vendor. Writing to this file taints the kernel with TAIN\_FIRMWARE\_WORKAROUND, which reduces the supportability of your system.

**/sys/bus/pci/devices/…/p2pmem/available**

Defined on file *sysfs-bus-pci*

If the device has any Peer-to-Peer memory registered, this file contains the amount of memory that has not been allocated (in decimal).

### **/sys/bus/pci/devices/…/p2pmem/published**

Defined on file *sysfs-bus-pci*

If the device has any Peer-to-Peer memory registered, this file contains a ‘1’ if the memory has been published for use outside the driver that owns the device.

### **/sys/bus/pci/devices/…/p2pmem/size**

Defined on file *sysfs-bus-pci*

If the device has any Peer-to-Peer memory registered, this file contains the total amount of memory that the device provides (in decimal).

### **/sys/bus/pci/devices/…/pci\_bus/…/rescan**

Defined on file *sysfs-bus-pci*

Writing a non-zero value to this attribute will force a rescan of the bus and all child buses, and re-discover devices removed earlier from this part of the device tree.

### **/sys/bus/pci/devices/…/physfn**

Defined on file *sysfs-bus-pci*

This symbolic link appears when a device is a Virtual Function. The symbolic link points to the PCI device sysfs entry of the Physical Function this device associates with.

### **/sys/bus/pci/devices/…/remove**

Defined on file *sysfs-bus-pci*

Writing a non-zero value to this attribute will hot-remove the PCI device and any of its children.

### **/sys/bus/pci/devices/…/rescan**

Defined on file *sysfs-bus-pci*

Writing a non-zero value to this attribute will force a rescan of the device’s parent bus and all child buses, and re-discover devices removed earlier from this part of the device tree.

**/sys/bus/pci/devices/…/reset**

Defined on file *sysfs-bus-pci*

Some devices allow an individual function to be reset without affecting other functions in the same device. For devices that have this support, a file named `reset` will be present in sysfs. Writing 1 to this file will perform reset.

**/sys/bus/pci/devices/…/revision**

Defined on file *sysfs-bus-pci*

This file contains the revision field of the PCI device. The value comes from device config space. The file is read only.

**/sys/bus/pci/devices/…/sriov\_drivers\_autoprobe**

Defined on file *sysfs-bus-pci*

This file is associated with the PF of a device that supports SR-IOV. It determines whether newly-enabled VFs are immediately bound to a driver. It initially contains 1, which means the kernel automatically binds VFs to a compatible driver immediately after they are enabled. If an application writes 0 to the file before enabling VFs, the kernel will not bind VFs to a driver.

A typical use case is to write 0 to this file, then enable VFs, then assign the newly-created VFs to virtual machines. Note that changing this file does not affect already-enabled VFs. In this scenario, the user must first disable the VFs, write 0 to `sriov_drivers_autoprobe`, then re-enable the VFs.

This is similar to `/sys/bus/pci/drivers_autoprobe`, but affects only the VFs associated with a specific PF.

**/sys/bus/pci/devices/…/sriov\_numvfs**

Defined on file *sysfs-bus-pci*

This file appears when a physical PCIe device supports SR-IOV. Userspace applications can read and write to this file to determine and control the enablement or disablement of Virtual Functions (VFs) on the physical function (PF). A read of this file will return the number of VFs that are enabled on this PF. A number written to this file will enable the specified number of VFs. A userspace application would typically read the file and check that the value is zero, and then write the number of VFs that should be enabled on the PF; the value written should be less than or equal to the value in the `sriov_totalvfs` file. A userspace application wanting to disable the VFs would write a zero to this file. The core ensures that valid values are written to this file, and returns errors when values are not valid. For example, writing a 2 to this file when `sriov_numvfs` is not 0 and not 2 already will return an error. Writing a 10 when the value of `sriov_totalvfs` is 8 will return an error.

### /sys/bus/pci/devices/…/sriov\_totalvfs

Defined on file *sysfs-bus-pci*

This file appears when a physical PCIe device supports SR-IOV. Userspace applications can read this file to determine the maximum number of Virtual Functions (VFs) a PCIe physical function (PF) can support. Typically, this is the value reported in the PF's SR-IOV extended capability structure's TotalVFs element. Drivers have the ability at probe time to reduce the value read from this file via the `pci_sriov_set_totalvfs()` function.

### /sys/bus/pci/devices/…/virtfnN

Defined on file *sysfs-bus-pci*

This symbolic link appears when hardware supports the SR-IOV capability and the Physical Function driver has enabled it. The symbolic link points to the PCI device sysfs entry of the Virtual Function whose index is N (0…MaxVFs-1).

### /sys/bus/pci/devices/…/vpd

Defined on file *sysfs-bus-pci*

A file named vpd in a device directory will be a binary file containing the Vital Product Data for the device. It should follow the VPD format defined in PCI Specification 2.1 or 2.2, but users should consider that some devices may have malformatted data. If the underlying VPD has a writable section then the corresponding section of this file will be writable.

### /sys/bus/pci/devices/<bdf>/<device>/VPC2004:00/fn\_lock

Defined on file *sysfs-platform-ideapad-laptop*

Control fn-lock mode.

- 1 -> Switched On
- 0 -> Switched Off

For example:

```
# echo "0" > \
/sys/bus/pci/devices/0000:00:1f.0/PNP0C09:00/VPC2004:00/fn_lock
```

### /sys/bus/pci/devices/<dev>/aer\_dev\_correctable

Defined on file *sysfs-bus-pci-devices-aer\_stats*

List of correctable errors seen and reported by this PCI device using ERR\_COR. Note that since multiple errors may be reported using a single ERR\_COR message,

thus TOTAL\_ERR\_COR at the end of the file may not match the actual total of all the errors in the file. Sample output:

```
localhost /sys/devices/pci0000:00/0000:00:1c.0 # cat aer_dev_
˓→correctable
Receiver Error 2
Bad TLP 0
Bad DLLP 0
RELAY_NUM Rollover 0
Replay Timer Timeout 0
Advisory Non-Fatal 0
Corrected Internal Error 0
Header Log Overflow 0
TOTAL_ERR_COR 2
```

### **/sys/bus/pci/devices/<dev>/aer\_dev\_fatal**

Defined on file *sysfs-bus-pci-devices-aer\_stats*

List of uncorrectable fatal errors seen and reported by this PCI device using ERR\_FATAL. Note that since multiple errors may be reported using a single ERR\_FATAL message, thus TOTAL\_ERR\_FATAL at the end of the file may not match the actual total of all the errors in the file. Sample output:

```
localhost /sys/devices/pci0000:00/0000:00:1c.0 # cat aer_dev_fatal
Undefined 0
Data Link Protocol 0
Surprise Down Error 0
Poisoned TLP 0
Flow Control Protocol 0
Completion Timeout 0
Completer Abort 0
Unexpected Completion 0
Receiver Overflow 0
Malformed TLP 0
ECRC 0
Unsupported Request 0
ACS Violation 0
Uncorrectable Internal Error 0
MC Blocked TLP 0
AtomicOp Egress Blocked 0
TLP Prefix Blocked Error 0
TOTAL_ERR_FATAL 0
```

### **/sys/bus/pci/devices/<dev>/aer\_dev\_nonfatal**

Defined on file *sysfs-bus-pci-devices-aer\_stats*

List of uncorrectable nonfatal errors seen and reported by this PCI device using ERR\_NONFATAL. Note that since multiple errors may be reported using a single

ERR\_FATAL message, thus TOTAL\_ERR\_NONFATAL at the end of the file may not match the actual total of all the errors in the file. Sample output:

```
localhost /sys/devices/pci0000:00/0000:00:1c.0 # cat aer_dev_
˓→nonfatal
Undefined 0
Data Link Protocol 0
Surprise Down Error 0
Poisoned TLP 0
Flow Control Protocol 0
Completion Timeout 0
Completer Abort 0
Unexpected Completion 0
Receiver Overflow 0
Malformed TLP 0
ECRC 0
Unsupported Request 0
ACS Violation 0
Uncorrectable Internal Error 0
MC Blocked TLP 0
AtomicOp Egress Blocked 0
TLP Prefix Blocked Error 0
TOTAL_ERR_NONFATAL 0
```

### PCIe Rootport AER statistics

These attributes show up under only the rootports (or root complex event collectors) that are AER capable. These indicate the number of error messages as “reported to” the rootport. Please note that the rootports also transmit (internally) the ERR\_\* messages for errors seen by the internal rootport PCI device, so these counters include them and are thus cumulative of all the error messages on the PCI hierarchy originating at that root port.

---

**/sys/bus/pci/devices/<dev>/aer\_stats/aer\_rootport\_total\_err\_cor**

---

Defined on file [sysfs-bus-pci-devices-aer\\_stats](#)

Total number of ERR\_COR messages reported to rootport.

---

**/sys/bus/pci/devices/<dev>/aer\_stats/aer\_rootport\_total\_err\_fatal**

---

Defined on file [sysfs-bus-pci-devices-aer\\_stats](#)

Total number of ERR\_FATAL messages reported to rootport.

---

**/sys/bus/pci/devices/<dev>/aer\_stats/aer\_rootport\_total\_err\_nonfatal**

---

Defined on file [sysfs-bus-pci-devices-aer\\_stats](#)

Total number of ERR\_NONFATAL messages reported to rootport.

---

**/sys/bus/pci/devices/<dev>/ccissX/cXdY/block:cciss!cXdY**

Defined on file *sysfs-bus-pci-devices-cciss*

A symbolic link to /sys/block/cciss!cXdY

---

**/sys/bus/pci/devices/<dev>/ccissX/cXdY/lunid**

Defined on file *sysfs-bus-pci-devices-cciss*

Displays the 8-byte LUN ID used to address logical drive Y of controller X.

---

**/sys/bus/pci/devices/<dev>/ccissX/cXdY/model**

Defined on file *sysfs-bus-pci-devices-cciss*

Displays the SCSI INQUIRY page 0 model for logical drive Y of controller X.

---

**/sys/bus/pci/devices/<dev>/ccissX/cXdY/raid\_level**

Defined on file *sysfs-bus-pci-devices-cciss*

Displays the RAID level of logical drive Y of controller X.

---

**/sys/bus/pci/devices/<dev>/ccissX/cXdY/rev**

Defined on file *sysfs-bus-pci-devices-cciss*

Displays the SCSI INQUIRY page 0 revision for logical drive Y of controller X.

---

**/sys/bus/pci/devices/<dev>/ccissX/cXdY/unique\_id**

Defined on file *sysfs-bus-pci-devices-cciss*

Displays the SCSI INQUIRY page 83 serial number for logical drive Y of controller X.

---

**/sys/bus/pci/devices/<dev>/ccissX/cXdY/usage\_count**

Defined on file *sysfs-bus-pci-devices-cciss*

Displays the usage count (number of opens) of logical drive Y of controller X.

---

**/sys/bus/pci/devices/<dev>/ccissX/cXdY/vendor**

Defined on file *sysfs-bus-pci-devices-cciss*

Displays the SCSI INQUIRY page 0 vendor for logical drive Y of controller X.

### /sys/bus/pci/devices/<dev>/ccissX/rescan

Defined on file *sysfs-bus-pci-devices-cciss*

Kicks off a rescan of the controller to discover logical drive topology changes.

### /sys/bus/pci/devices/<dev>/ccissX/resettable

Defined on file *sysfs-bus-pci-devices-cciss*

Value of 1 indicates the controller can honor the `reset_devices` kernel parameter. Value of 0 indicates `reset_devices` cannot be honored. This is to allow, for example, kexec tools to be able to warn the user if they designate an unresettable device as a dump device, as kdump requires resetting the device in order to work reliably.

### /sys/bus/pci/devices/<dev>/ccissX/transport\_mode

Defined on file *sysfs-bus-pci-devices-cciss*

Value of “simple” indicates that the controller has been placed in “simple mode”. Value of “performant” indicates that the controller has been placed in “performant mode” .

### /sys/bus/pci/drivers/…/bind

Defined on file *sysfs-bus-pci*

Writing a device location to this file will cause the driver to attempt to bind to the device found at this location. This is useful for overriding default bindings. The format for the location is: DDDD:BB:DD.F. That is Domain:Bus:Device.Function and is the same as found in /sys/bus/pci/devices/. For example:

```
# echo 0000:00:19.0 > /sys/bus/pci/drivers/foo/bind
```

(Note: kernels before 2.6.28 may require echo -n).

### /sys/bus/pci/drivers/…/new\_id

Defined on file *sysfs-bus-pci*

Writing a device ID to this file will attempt to dynamically add a new device ID to a PCI device driver. This may allow the driver to support more hardware than was included in the driver’s static device ID support table at compile time. The format for the device ID is: VVVV DDDD SVVV SDDD CCCC MMMM PPPP. That is Vendor ID, Device ID, Subsystem Vendor ID, Subsystem Device ID, Class, Class Mask, and Private Driver Data. The Vendor ID and Device ID fields are required, the rest are optional. Upon successfully adding an ID, the driver will probe for the device and attempt to bind to it. For example:

```
# echo "8086 10f5" > /sys/bus/pci/drivers/foo/new_id
```

### **/sys/bus/pci/drivers/…/remove\_id**

Defined on file *sysfs-bus-pci*

Writing a device ID to this file will remove an ID that was dynamically added via the new\_id sysfs entry. The format for the device ID is: VVVV DDDD SVVV SDDD CCCC MMMM. That is Vendor ID, Device ID, Subsystem Vendor ID, Subsystem Device ID, Class, and Class Mask. The Vendor ID and Device ID fields are required, the rest are optional. After successfully removing an ID, the driver will no longer support the device. This is useful to ensure auto probing won't match the driver to the device. For example:

```
# echo "8086 10f5" > /sys/bus/pci/drivers/foo/remove_id
```

### **/sys/bus/pci/drivers/…/unbind**

Defined on file *sysfs-bus-pci*

Writing a device location to this file will cause the driver to attempt to unbind from the device found at this location. This may be useful when overriding default bindings. The format for the location is: DDDD:BB:DD.F. That is Domain:Bus:Device.Function and is the same as found in /sys/bus/pci/devices/. For example:

```
# echo 0000:00:19.0 > /sys/bus/pci/drivers/foo/unbind
```

(Note: kernels before 2.6.28 may require echo -n).

### **/sys/bus/pci/drivers/altera-cvp/chkcfg**

Defined on file *sysfs-driver-altera-cvp*

Contains either 1 or 0 and controls if configuration error checking in altera-cvp driver is turned on or off.

### **/sys/bus/pci/drivers/ehci\_hcd/…/companion**

Defined on file *sysfs-bus-pci-drivers-ehci\_hcd*

PCI-based EHCI USB controllers (i.e., high-speed USB-2.0 controllers) are often implemented along with a set of “companion” full/low-speed USB-1.1 controllers. When a high-speed device is plugged in, the connection is routed to the EHCI controller; when a full- or low-speed device is plugged in, the connection is routed to the companion controller.

Sometimes you want to force a high-speed device to connect at full speed, which can be accomplished by forcing the connection to be routed to the companion

controller. That's what this file does. Writing a port number to the file causes connections on that port to be routed to the companion controller, and writing the negative of a port number returns the port to normal operation.

For example: To force the high-speed device attached to port 4 on bus 2 to run at full speed:

```
echo 4 >/sys/bus/usb/devices/usb2/.../companion
```

To return the port to high-speed operation:

```
echo -4 >/sys/bus/usb/devices/usb2/.../companion
```

Reading the file gives the list of ports currently forced to the companion controller.

Note: Some EHCI controllers do not have companions; they may contain an internal “transaction translator” or they may be attached directly to a “rate-matching hub”. This mechanism will not work with such controllers. Also, it cannot be used to force a port on a high-speed hub to connect at full speed.

Note: When this file was first added, it appeared in a different sysfs directory. The location given above is correct for 2.6.35 (and probably several earlier kernel versions as well).

---

### **/sys/bus/pci/drivers/janz-cmodio/.../modulbus\_number**

---

Defined on file [sysfs-bus-pci-drivers-janz-cmodio](#)

Value representing the HEX switch S2 of the janz carrier board CMOD-IO or CAN-PCI2

Read-only: value of the configuration switch (0..15)

---

### **/sys/bus/pci/drivers/pciback/allow\_interrupt\_control**

---

Defined on file [sysfs-driver-pciback](#)

List of devices which can have interrupt control flag (INTx, MSI, MSI-X) set by a connected guest. It is meant to be set only when the guest is a stubdomain hosting device model (qemu) and the actual device is assigned to a HVM. It is not safe (similar to permissive attribute) to set for a devices assigned to a PV guest. The device is automatically removed from this list when the connected pcifront terminates.

---

### **/sys/bus/pci/drivers/pciback/quirks**

---

Defined on file [sysfs-driver-pciback](#)

If the permissive attribute is set, then writing a string in the format of DDDD:BB:DD.F-REG:SIZE:MASK will allow the guest to write and read from the PCI device. That is Domain:Bus: Device.Function-Register:Size:Mask (Domain is optional). For example:

```
#echo 00:19.0-E0:2:FF > :ref:`\sys\bus\pci\drivers\pciback\`  
↳ quirks <abi_sys_bus_pci_drivers_pciback_quirks>
```

will allow the guest to read and write to the configuration register 0x0E.

### /sys/bus/pci/drivers/xhci\_hcd/…/dbc

Defined on file [sysfs-bus-pci-drivers-xhci\\_hcd](#)

xHCI compatible USB host controllers (i.e. super-speed USB3 controllers) are often implemented with the Debug Capability (DbC). It can present a debug device which is fully compliant with the USB framework and provides the equivalent of a very high performance full-duplex serial link for debug purpose.

The DbC debug device shares a root port with xHCI host. When the DbC is enabled, the root port will be assigned to the Debug Capability. Otherwise, it will be assigned to xHCI.

Writing “enable” to this attribute will enable the DbC functionality and the shared root port will be assigned to the DbC device. Writing “disable” to this attribute will disable the DbC functionality and the shared root port will roll back to the xHCI.

Reading this attribute gives the state of the DbC. It can be one of the following states: disabled, enabled, initialized, connected, configured and stalled.

### /sys/bus/pci/rescan

Defined on file [sysfs-bus-pci](#)

Writing a non-zero value to this attribute will force a rescan of all PCI buses in the system, and re-discover previously removed devices.

### /sys/bus/pci/slots/…/module

Defined on file [sysfs-bus-pci](#)

This symbolic link points to the PCI hotplug controller driver module that manages the hotplug slot.

### /sys/bus/platform/devices/\*twl4030-usb/vbus

Defined on file [sysfs-platform-twl4030-usb](#)

Read-only status reporting if VBUS (approx 5V) is being supplied by the USB bus.

Possible values: “on”, “off” .

Changes are notified via select/poll.

### /sys/bus/platform/devices/…/driver\_override

Defined on file *sysfs-bus-platform*

This file allows the driver for a device to be specified which will override standard OF, ACPI, ID table, and name matching. When specified, only a driver with a name matching the value written to `driver_override` will have an opportunity to bind to the device. The override is specified by writing a string to the `driver_override` file (`echo vfio-platform > driver_override`) and may be cleared with an empty string (`echo > driver_override`). This returns the device to standard matching rules binding. Writing to `driver_override` does not automatically unbind the device from its current driver or make any attempt to automatically load the specified driver. If no driver with a matching name is currently loaded in the kernel, the device will not bind to any driver. This also allows devices to opt-out of driver binding using a `driver_override` name such as “none”. Only a single driver may be specified in the override, there is no support for parsing delimiters.

### **/sys/bus/platform/devices/…/numa\_node**

Defined on file *sysfs-bus-platform*

This file contains the NUMA node to which the platform device is attached. It won't be visible if the node is unknown. The value comes from an ACPI \_PXM method or a similar firmware source. Initial users for this file would be devices like arm\_smmu which are populated by arm64 acpi\_iort.

### **/sys/bus/platform/devices/..../cfam\_reset**

Defined on file *sysfs-bus-fsi*

Provides a means of resetting the cfam that is attached to the FSI device.

### **/sys/bus/platform/devices/..../fsi-master/fsi0/break**

Defined on file *sysfs-bus-fsi*

Sends an FSI BREAK command on a master's communication link to any connected slaves. A BREAK resets connected device's logic and prep's it to receive further commands from the master.

### **/sys/bus/platform/devices/..../fsi-master/fsi0/rescan**

Defined on file *sysfs-bus-fsi*

Initiates a FSI master scan for all connected slave devices on its links.

### **/sys/bus/platform/devices/..../fsi-master/fsi0/slave@00:00/raw**

Defined on file *sysfs-bus-fsi*

Provides a means of reading/writing a 32 bit value from/to a specified FSI bus address.

**/sys/bus/platform/devices/..../fsi-master/fsi0/slave@00:00/term**

Defined on file [sysfs-bus-fsi](#)

Sends an FSI terminate command from the master to its connected slave. A terminate resets the slave’s state machines that control access to the internally connected engines. In addition the slave freezes its internal error register for debugging purposes. This command is also needed to abort any ongoing operation in case of an expired ‘Master Time Out’ timer.

**/sys/bus/platform/devices/ACPI000E:00/ac\_alarm**

Defined on file [sysfs-devices-platform-ACPI-TAD](#)

(RW) The AC alarm timer value.

Reads return the current AC alarm timer value in seconds or “disabled”, if the AC alarm is not set to wake up the system.

Write a new AC alarm timer value in seconds or “disabled” to it to set the AC alarm timer or to disable it, respectively.

If the AC alarm timer is set through this attribute and it expires, it will immediately wake up the system from the S3 sleep state (and from S4/S5 too if supported) until its status is explicitly cleared via the ac\_status attribute.

**/sys/bus/platform/devices/ACPI000E:00/ac\_policy**

Defined on file [sysfs-devices-platform-ACPI-TAD](#)

(RW) The AC alarm expired timer wake policy (see ACPI 6.2, Section 9.18 for details).

Reads return the current expired timer wake delay for the AC alarm timer or “never”, if the policy is to discard AC timer wakeups if the system is on DC power.

Write a new expired timer wake delay for the AC alarm timer in seconds or “never” to it to set the expired timer wake delay for the AC alarm timer or to set its expired wake policy to discard wakeups if the system is on DC power, respectively.

**/sys/bus/platform/devices/ACPI000E:00/ac\_status**

Defined on file [sysfs-devices-platform-ACPI-TAD](#)

(RW) The AC alarm status.

Reads return a hexadecimal bitmask representing the AC alarm timer status with the following meaning of bits (see ACPI 6.2, Section 9.18.5):

Bit(0): The timer has expired if set.

Bit(1): The timer has woken up the system from a sleep state (S3 or S4/S5 if supported) if set.

The other bits are reserved.

Reads also cause the AC alarm timer status to be reset.

Another way to reset the the status of the AC alarm timer is to write (the number) 0 to this file.

If the status return value indicates that the timer has expired, it will immediately wake up the system from the S3 sleep state (and from S4/S5 too if supported) until its status is explicitly cleared through this attribute.

### **/sys/bus/platform/devices/ACPI000E:00/caps**

Defined on file *sysfs-devices-platform-ACPI-TAD*

(RO) Hexadecimal bitmask of the TAD attributes are reported by the platform firmware (see ACPI 6.2, section 9.18.2):

BIT(0):	AC wakeup implemented if set
BIT(1):	DC wakeup implemented if set
BIT(2):	Get/set real time features implemented if set
BIT(3):	Real time accuracy in milliseconds if set
BIT(4):	Correct status reported for wakeups from S4/S5 if set
BIT(5):	The AC timer wakes up from S4 if set
BIT(6):	The AC timer wakes up from S5 if set
BIT(7):	The DC timer wakes up from S4 if set
BIT(8):	The DC timer wakes up from S5 if set

The other bits are reserved.

### **/sys/bus/platform/devices/ACPI000E:00/dc\_alarm**

Defined on file *sysfs-devices-platform-ACPI-TAD*

(RW,optional) The DC alarm timer value.

This attribute is only present if the TAD supports a separate DC timer.

It is analogous to the ac\_alarm attribute.

### **/sys/bus/platform/devices/ACPI000E:00/dc\_policy**

Defined on file *sysfs-devices-platform-ACPI-TAD*

(RW,optional) The DC alarm expired timer wake policy.

This attribute is only present if the TAD supports a separate DC timer.

It is analogous to the ac\_policy attribute.

### **/sys/bus/platform/devices/ACPI000E:00/dc\_status**

Defined on file *sysfs-devices-platform-ACPI-TAD*

(RW,optional) The DC alarm status.

This attribute is only present if the TAD supports a separate DC timer.

It is analogous to the ac\_status attribute.

---

### **/sys/bus/platform/devices/GOOG000C\:00/boot\_on\_ac**

---

Defined on file *sysfs-platform-wilco-ec*

Boot on AC is a policy which makes the device boot from S5 when AC power is connected. This is useful for users who want to run their device headless or with a dock.

Input should be parseable by kstrtou8() to 0 or 1.

---

### **/sys/bus/platform/devices/GOOG000C\:00/build\_date**

---

Defined on file *sysfs-platform-wilco-ec*

Display Wilco Embedded Controller firmware build date. Output will a MM/DD/YY string.

---

### **/sys/bus/platform/devices/GOOG000C\:00/build\_revision**

---

Defined on file *sysfs-platform-wilco-ec*

Display Wilco Embedded Controller build revision. Output will a version string be similar to the example below: d2592cae0

---

### **/sys/bus/platform/devices/GOOG000C\:00/model\_number**

---

Defined on file *sysfs-platform-wilco-ec*

Display Wilco Embedded Controller model number. Output will a version string be similar to the example below: 08B6

---

### **/sys/bus/platform/devices/GOOG000C\:00/usb\_charge**

---

Defined on file *sysfs-platform-wilco-ec*

Control the USB PowerShare Policy. USB PowerShare is a policy which affects charging via the special USB PowerShare port (marked with a small lightning bolt or battery icon) when in low power states:

- In S0, the port will always provide power.
- In S0ix, if usb\_charge is enabled, then power will be supplied to the port when on AC or if battery is > 50%. Else no power is supplied.

- In S5, if `usb_charge` is enabled, then power will be supplied to the port when on AC. Else no power is supplied.

Input should be either “0” or “1” .

---

### **/sys/bus/platform/devices/GOOG000C\:00/version**

---

Defined on file *sysfs-platform-wilco-ec*

Display Wilco Embedded Controller firmware version. The format of the string is x.y.z. Where x is major, y is minor and z is the build number. For example: 95.00.06

---

### **/sys/bus/platform/devices/INT3407:00/dptf\_power/adapter\_rating\_mw**

---

Defined on file *sysfs-platform-dptf*

(RO) Adapter rating in milliwatts (the maximum Adapter power). Must be 0 if no AC Adaptor is plugged in.

---

### **/sys/bus/platform/devices/INT3407:00/dptf\_power/battery\_steady\_power**

---

Defined on file *sysfs-platform-dptf*

(RO) The maximum sustained power for battery in milliwatts.

---

### **/sys/bus/platform/devices/INT3407:00/dptf\_power/charger\_type**

---

Defined on file *sysfs-platform-dptf*

(RO) The charger type - Traditional, Hybrid or NVDC.

---

### **/sys/bus/platform/devices/INT3407:00/dptf\_power/max\_platform\_power\_mw**

---

Defined on file *sysfs-platform-dptf*

(RO) Maximum platform power that can be supported by the battery in milliwatts.

---

### **/sys/bus/platform/devices/INT3407:00/dptf\_power/platform\_power\_source**

---

Defined on file *sysfs-platform-dptf*

(RO) Display the platform power source

bits[3:0] Current power source - 0x00 = DC - 0x01 = AC - 0x02 = USB - 0x03 = Wireless Charger  
bits[7:4] Power source sequence number

---

---

### **/sys/bus/platform/devices/INT3407:00/dptf\_power/prochot\_confirm**

---

Defined on file *sysfs-platform-dptf*

(WO) Confirm embedded controller about a prochot notification.

---

**/sys/bus/platform/devices/INT3407:00/dptf\_power/rest\_of\_platform\_power\_mw**

---

Defined on file *sysfs-platform-dptf*

(RO) Shows the rest (outside of SoC) of worst-case platform power.

---

**/sys/bus/platform/devices/INT3532:00/dptf\_battery/current\_discharge\_capability\_ma**

---

Defined on file *sysfs-platform-dptf*

(RO) The battery discharge current capability obtained from battery fuel gauge in milli Amps.

---

**/sys/bus/platform/devices/INT3532:00/dptf\_battery/high\_freq\_impedance\_mohm**

---

Defined on file *sysfs-platform-dptf*

(RO) The high frequency impedance value that can be obtained from battery fuel gauge in milli Ohms.

---

**/sys/bus/platform/devices/INT3532:00/dptf\_battery/max\_platform\_power\_mw**

---

Defined on file *sysfs-platform-dptf*

(RO) The maximum platform power that can be supported by the battery in milli watts.

---

**/sys/bus/platform/devices/INT3532:00/dptf\_battery/max\_steady\_state\_power\_kw**

---

Defined on file *sysfs-platform-dptf*

(RO) The maximum sustained power for battery in milli watts.

---

**/sys/bus/platform/devices/INT3532:00/dptf\_battery/no\_load\_voltage\_mv**

---

Defined on file *sysfs-platform-dptf*

(RO) The no-load voltage that can be obtained from battery fuel gauge in milli volts.

---

**/sys/bus/platform/devices/INTC1045:00/pch\_fivr\_switch\_frequency/freq\_mhz\_high\_clk**

---

Defined on file *sysfs-platform-dptf*

(RW) The PCH FIVR (Fully Integrated Voltage Regulator) switching frequency in MHz, when FIVR clock is 38.4MHz.

### **/sys/bus/platform/devices/INTC1045:00/pch\_fivr\_switch\_frequency/freq\_mhz\_low\_clock**

Defined on file *sysfs-platform-dptf*

(RW) The PCH FIVR (Fully Integrated Voltage Regulator) switching frequency in MHz, when FIVR clock is 19.2MHz or 24MHz.

### **/sys/bus/platform/devices/MLNXBF04:00/lifecycle\_state**

Defined on file *sysfs-platform-mellanox-bootctl*

The Life-cycle state of the SoC, which could be one of the following values.

Production	Production state and can be updated to secure
GA Secured	Secure chip and not able to change state
GA Non-Secured	Non-Secure chip and not able to change state
RMA	Return Merchandise Authorization

### **/sys/bus/platform/devices/MLNXBF04:00/post\_reset\_wdog**

Defined on file *sysfs-platform-mellanox-bootctl*

The watchdog setting in seconds for the next booting. It's used to reboot the chip and recover it to the old state if the new boot partition fails.

### **/sys/bus/platform/devices/MLNXBF04:00/reset\_action**

Defined on file *sysfs-platform-mellanox-bootctl*

The source of the boot stream for the next reset. It could be one of the following values:

external	boot from external source (USB or PCIe)
emmc	boot from the onchip eMMC
emmc_legacy	boot from the onchip eMMC in legacy (slow) mode

### **/sys/bus/platform/devices/MLNXBF04:00/second\_reset\_action**

Defined on file *sysfs-platform-mellanox-bootctl*

Update the source of the boot stream after next reset. It could be one of the following values and will be applied after next reset.

external	boot from external source (USB or PCIe)
emmc	boot from the onchip eMMC
emmc_legacy	boot from the onchip eMMC in legacy (slow) mode
swap_emmc	swap the primary / secondary boot partition
none	cancel the action

**/sys/bus/platform/devices/MLNXBF04:00/secure\_boot\_fuse\_state**

Defined on file *sysfs-platform-mellanox-bootctl*

The state of eFuse versions with the following values.

InUse	burnt, valid and currently in use
Used	burnt and valid
Free	not burnt and free to use
Skipped	not burnt but not free (skipped)
Wasted	burnt and invalid
Invalid	not burnt but marked as valid (error state).

**/sys/bus/platform/devices/[..]/fsi-master-gpio/external\_mode**

Defined on file *sysfs-driver-fsi-master-gpio*

Controls access arbitration for GPIO-based FSI master. A value of 0 (the default) sets normal mode, where the driver performs FSI bus transactions, 1 sets external mode, where the FSI bus is driven externally (for example, by a debug device).

**/sys/bus/platform/devices/ci\_hdrc.0/inputs/a\_bus\_drop**

Defined on file *sysfs-platform-chipidea-usb-otg*

Can be set and read. The a\_bus\_drop(A-device bus drop) input is 1 when the application running on the A-device wants to power down the bus, and is 0 otherwise. When a\_bus\_drop is 1, then the a\_bus\_req shall be 0.

Valid values are “1” and “0” .

**Reading:** returns 1 if the bus is off(vbus is turned off) by A-device, otherwise 0.

**/sys/bus/platform/devices/ci\_hdrc.0/inputs/a\_bus\_req**

Defined on file *sysfs-platform-chipidea-usb-otg*

Can be set and read. Set a\_bus\_req(A-device bus request) input to be 1 if the application running on the A-device wants to use the bus, and to be 0 when the application no longer wants to use the bus(or wants to work as peripheral). a\_bus\_req

can also be set to 1 by kernel in response to remote wakeup signaling from the B-device, the A-device should decide to resume the bus.

Valid values are “1” and “0” .

Reading: returns 1 if the application running on the A-device is using the bus as host role, otherwise 0.

---

### **/sys/bus/platform/devices/ci\_hdrc.0/inputs/a\_clr\_err**

---

Defined on file *sysfs-platform-chipidea-usb-otg*

Only can be set. The a\_clr\_err(A-device Vbus error clear) input is used to clear vbus error, then A-device will power down the bus.

Valid value is “1”

---

### **/sys/bus/platform/devices/ci\_hdrc.0/inputs/b\_bus\_req**

---

Defined on file *sysfs-platform-chipidea-usb-otg*

Can be set and read. The b\_bus\_req(B-device bus request) input is 1 during the time that the application running on the B-device wants to use the bus as host, and is 0 when the application no longer wants to work as host and decides to switch back to be peripheral.

Valid values are “1” and “0” .

Reading: returns if the application running on the B device is using the bus as host role, otherwise 0.

---

### **/sys/bus/platform/devices/ci\_hdrc.0/role**

---

Defined on file *sysfs-platform-chipidea-usb2*

It returns string “gadget” or “host” when read it, it indicates current controller role.

It will do role switch when write “gadget” or “host” to it. Only controller at dual-role configuration supports writing.

---

### **/sys/bus/platform/devices/dfl-fme.0/bitstream\_id**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns Bitstream (static FPGA region) identifier number, which includes the detailed version and other information of this static FPGA region.

---

### **/sys/bus/platform/devices/dfl-fme.0/bitstream\_metadata**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns Bitstream (static FPGA region) meta data, which includes the synthesis date, seed and other information of this static FPGA region.

---

**/sys/bus/platform/devices/dfl-fme.0/cache\_size**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns cache size of this FPGA device.

---

**/sys/bus/platform/devices/dfl-fme.0/errors/catfatal\_errors**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns catastrophic and fatal errors detected.

---

**/sys/bus/platform/devices/dfl-fme.0/errors/first\_error**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. Read this file to get the first error detected by hardware.

---

**/sys/bus/platform/devices/dfl-fme.0/errors/fme\_errors**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Write. Read this file to get errors detected on FME. Write this file to clear errors logged in fme\_errors. Write fails with -EINVAL if input parsing fails or input error code doesn't match.

---

**/sys/bus/platform/devices/dfl-fme.0/errors/inject\_errors**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Write. Read this file to check errors injected. Write this file to inject errors for testing purpose. Write fails with -EINVAL if input parsing fails or input inject error code isn't supported.

---

**/sys/bus/platform/devices/dfl-fme.0/errors/next\_error**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. Read this file to get the second error detected by hardware.

---

**/sys/bus/platform/devices/dfl-fme.0/errors/nonfatal\_errors**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns non-fatal errors detected.

### **/sys/bus/platform/devices/dfl-fme.0/errors/pcie0\_errors**

Defined on file *sysfs-platform-dfl-fme*

Read-Write. Read this file for errors detected on pcie0 link. Write this file to clear errors logged in pcie0\_errors. Write fails with -EINVAL if input parsing fails or input error code doesn't match.

### **/sys/bus/platform/devices/dfl-fme.0/errors/pcie1\_errors**

Defined on file *sysfs-platform-dfl-fme*

Read-Write. Read this file for errors detected on pcie1 link. Write this file to clear errors logged in pcie1\_errors. Write fails with -EINVAL if input parsing fails or input error code doesn't match.

### **/sys/bus/platform/devices/dfl-fme.0/fabric\_version**

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns fabric version of this FPGA device. Userspace applications need this information to select best data channels per different fabric design.

### **/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/name**

Defined on file *sysfs-platform-dfl-fme*

Read-Only. Read this file to get the name of hwmon device, it supports values:

'dfl_fme_thermal'	thermal hwmon device name
'dfl_fme_power'	power hwmon device name

### **/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1\_crit**

Defined on file *sysfs-platform-dfl-fme*

Read-Write. Read this file to get current hardware power threshold2 in uW. If power consumption rises at or above this threshold, hardware starts 90% throttling. Write this file to set current hardware power threshold2 in uW. As hardware only accepts values in Watts, so input value will be round down per Watts (< 1 watts part will be discarded) and clamped within the range from 0 to 127 Watts. Write fails with -EINVAL if input parsing fails.

### **/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1\_crit\_alarm**

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns 1 if power consumption is currently at or above hardware threshold2 (see ‘power1\_crit’ ), otherwise 0.

---

**/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1\_fpga\_limit**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Only. It returns power limit for FPGA in uW.

---

**/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1\_input**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Only. It returns current FPGA power consumption in uW.

---

**/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1\_ltr**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. Read this file to get current Latency Tolerance Reporting (ltr) value. It returns 1 if all Accelerated Function Units (AFUs) can tolerate latency  $\geq$  40us for memory access or 0 if any AFU is latency sensitive (< 40us).

---

**/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1\_max**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Write. Read this file to get current hardware power threshold1 in uW. If power consumption rises at or above this threshold, hardware starts 50% throttling. Write this file to set current hardware power threshold1 in uW. As hardware only accepts values in Watts, so input value will be round down per Watts (< 1 watts part will be discarded) and clamped within the range from 0 to 127 Watts. Write fails with -EINVAL if input parsing fails.

---

**/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1\_max\_alarm**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns 1 if power consumption is currently at or above hardware threshold1 (see ‘power1\_max’ ), otherwise 0.

---

**/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1\_xeon\_limit**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Only. It returns power limit for XEON in uW.

---

**/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1\_crit**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Only. It returns hardware threshold2 temperature in millidegrees Celsius. If temperature rises at or above this threshold, hardware starts 100% throttling.

---

### **/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1\_crit\_alarm**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns 1 if temperature is currently at or above hardware threshold2 (see ‘temp1\_crit’ ), otherwise 0.

---

### **/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1\_emergency**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Only. It returns hardware trip threshold temperature in millidegrees Celsius. If temperature rises at or above this threshold, a fatal event will be triggered to board management controller (BMC) to shutdown FPGA.

---

### **/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1\_input**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Only. It returns FPGA device temperature in millidegrees Celsius.

---

### **/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1\_max**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Only. It returns hardware threshold1 temperature in millidegrees Celsius. If temperature rises at or above this threshold, hardware starts 50% or 90% throttling (see ‘temp1\_max\_policy’ ).

---

### **/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1\_max\_alarm**

---

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns 1 if temperature is currently at or above hardware threshold1 (see ‘temp1\_max’ ), otherwise 0.

---

### **/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1\_max\_policy**

---

Defined on file *sysfs-platform-dfl-fme*

Read-Only. Read this file to get the policy of hardware threshold1 (see ‘temp1\_max’ ). It only supports two values (policies):

0	AP2 state (90% throttling)
1	AP1 state (50% throttling)

**/sys/bus/platform/devices/dfl-fme.0/ports\_num**

Defined on file *sysfs-platform-dfl-fme*

Read-only. One DFL FPGA device may have more than 1 port/Accelerator Function Unit (AFU). It returns the number of ports on the FPGA device when read it.

**/sys/bus/platform/devices/dfl-fme.0/socket\_id**

Defined on file *sysfs-platform-dfl-fme*

Read-only. It returns socket\_id to indicate which socket this FPGA belongs to, only valid for integrated solution. User only needs this information, in case standard numa node can't provide correct information.

**/sys/bus/platform/devices/dfl-port.0/afu\_id**

Defined on file *sysfs-platform-dfl-port*

Read-only. User can program different PR bitstreams to FPGA Accelerator Function Unit (AFU) for different functions. It returns uuid which could be used to identify which PR bitstream is programmed in this AFU.

**/sys/bus/platform/devices/dfl-port.0/ap1\_event**

Defined on file *sysfs-platform-dfl-port*

Read-write. Read this file for AP1 (AFU Power State 1) event. It's used to indicate transient AP1 state. Write 1 to this file to clear AP1 event.

**/sys/bus/platform/devices/dfl-port.0/ap2\_event**

Defined on file *sysfs-platform-dfl-port*

Read-write. Read this file for AP2 (AFU Power State 2) event. It's used to indicate transient AP2 state. Write 1 to this file to clear AP2 event.

**/sys/bus/platform/devices/dfl-port.0/errors/errors**

Defined on file *sysfs-platform-dfl-port*

Read-Write. Read this file to get errors detected on port and Accelerated Function Unit (AFU). Write error code to this file to clear errors. Write fails with -EINVAL if input parsing fails or input error code doesn't match. Write fails with -EBUSY or

-ETIMEDOUT if error can't be cleared as hardware in low power state (-EBUSY) or not responding (-ETIMEDOUT).

### **/sys/bus/platform/devices/dfl-port.0/errors/first\_error**

Defined on file *sysfs-platform-dfl-port*

Read-only. Read this file to get the first error detected by hardware.

### **/sys/bus/platform/devices/dfl-port.0/errors/first\_malformed\_req**

Defined on file *sysfs-platform-dfl-port*

Read-only. Read this file to get the first malformed request captured by hardware.

### **/sys/bus/platform/devices/dfl-port.0/id**

Defined on file *sysfs-platform-dfl-port*

Read-only. It returns id of this port. One DFL FPGA device may have more than one port. Userspace could use this id to distinguish different ports under same FPGA device.

### **/sys/bus/platform/devices/dfl-port.0/ltr**

Defined on file *sysfs-platform-dfl-port*

Read-write. Read or set AFU latency tolerance reporting value. Set ltr to 1 if the AFU can tolerate latency  $\geq$  40us or set it to 0 if it is latency sensitive.

### **/sys/bus/platform/devices/dfl-port.0/power\_state**

Defined on file *sysfs-platform-dfl-port*

Read-only. It reports the APx (AFU Power) state, different APx means different throttling level. When reading this file, it returns "0" - Normal / "1" - AP1 / "2" - AP2 / "6" - AP6.

### **/sys/bus/platform/devices/dfl-port.0/userclk\_freqcmd**

Defined on file *sysfs-platform-dfl-port*

Write-only. User writes command to this interface to set userclock to AFU.

### **/sys/bus/platform/devices/dfl-port.0/userclk\_freqcntrcmd**

Defined on file *sysfs-platform-dfl-port*

Write-only. User writes command to this interface to set userclock counter.

---

**/sys/bus/platform/devices/dfl-port.0/userclk\_freqcntrsts**

Defined on file *sysfs-platform-dfl-port*

Read-only. Read this file to get the status of issued command to userclk\_freqcntrcmd.

---

**/sys/bus/platform/devices/dfl-port.0/userclk\_freqsts**

Defined on file *sysfs-platform-dfl-port*

Read-only. Read this file to get the status of issued command to userclk\_freqcmd.

---

**/sys/bus/platform/devices/tahvo-usb/otg\_mode**

Defined on file *sysfs-platform-tahvo-usb*

Set or read the current OTG mode. Valid values are “host” and “peripheral” .

Reading: returns the current mode.

---

**/sys/bus/platform/devices/tahvo-usb/vbus**

Defined on file *sysfs-platform-tahvo-usb*

Read the current VBUS state.

Reading: returns “on” or “off” .

---

**/sys/bus/platform/drivers/ufshcd/\*/attributes/active\_icc\_level**

Defined on file *sysfs-driver-ufs*

This file provides the active icc level UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/attributes/bkops\_status**

Defined on file *sysfs-driver-ufs*

This file provides the background operations status UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/attributes/boot\_lun\_enabled**

Defined on file *sysfs-driver-ufs*

This file provides the boot lun enabled UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/configuration\_descriptor\_lock**

---

Defined on file *sysfs-driver-ufs*

This file shows whether the configuration descriptor is locked. The full information about the attribute could be found at UFS specifications 2.1. The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/current\_power\_mode**

---

Defined on file *sysfs-driver-ufs*

This file provides the current power mode UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/exception\_event\_control**

---

Defined on file *sysfs-driver-ufs*

This file provides the exception event control UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/exception\_event\_status**

---

Defined on file *sysfs-driver-ufs*

This file provides the exception event status UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/ffu\_status**

---

Defined on file *sysfs-driver-ufs*

This file provides the ffu status UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/max\_data\_in\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows the maximum data size in a DATA IN UPIU. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/max\_data\_out\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows the maximum number of bytes that can be requested with a READY TO TRANSFER UPIU. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/max\_number\_of\_rtt**

---

Defined on file *sysfs-driver-ufs*

This file provides the maximum current number of outstanding RTTs in device that is allowed. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/ooo\_data\_enabled**

---

Defined on file *sysfs-driver-ufs*

This file provides the out of order data transfer enabled UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/psa\_data\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows the amount of data that the host plans to load to all logical units in pre-soldering state. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/psa\_state**

---

Defined on file *sysfs-driver-ufs*

This file show the PSA feature status. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/purge\_status**

Defined on file *sysfs-driver-ufs*

This file provides the purge operation status UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/reference\_clock\_frequency**

Defined on file *sysfs-driver-ufs*

This file provides the reference clock frequency UFS device attribute. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/wb\_avail\_buf**

Defined on file *sysfs-driver-ufs*

This entry shows the amount of unused WriteBooster buffer available.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/wb\_cur\_buf**

Defined on file *sysfs-driver-ufs*

This entry shows the amount of unused current buffer.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/attributes/wb\_flush\_status**

Defined on file *sysfs-driver-ufs*

This entry shows the flush operation status.

00h	idle
01h	Flush operation in progress
02h	Flush operation stopped prematurely.
03h	Flush operation completed successfully
04h	Flush operation general failure

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/attributes/wb\_life\_time\_est**

---

Defined on file *sysfs-driver-ufs*

This entry shows an indication of the WriteBooster Buffer lifetime based on the amount of performed program/erase cycles

01h	0% - 10% WriteBooster Buffer life time used
...	
0Ah	90% - 100% WriteBooster Buffer life time used

---

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/bkops\_termination\_latency**

---

Defined on file *sysfs-driver-ufs*

This file shows the background operations termination latency. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/boot\_enable**

---

Defined on file *sysfs-driver-ufs*

This file shows value that indicates whether the device is enabled for boot. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor(descriptor\_access\_enable**

---

Defined on file *sysfs-driver-ufs*

This file shows value that indicates whether the device descriptor could be read after partial initialization phase of the boot sequence. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/device\_class**

---

Defined on file *sysfs-driver-ufs*

This file shows the device class. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/device\_sub\_class**

---

Defined on file *sysfs-driver-ufs*

This file shows the UFS storage subclass. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/device\_type**

---

Defined on file *sysfs-driver-ufs*

This file shows the device type. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/device\_version**

---

Defined on file *sysfs-driver-ufs*

This file shows the device version. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/ffu\_timeout**

---

Defined on file *sysfs-driver-ufs*

This file shows the FFU timeout. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/high\_priority\_lun**

---

Defined on file *sysfs-driver-ufs*

This file shows the high priority lun. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/initial\_active\_icc\_level**

---

Defined on file *sysfs-driver-ufs*

This file shows the initial active ICC level. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/initial\_power\_mode**

---

Defined on file *sysfs-driver-ufs*

This file shows value that defines the power mode after device initialization or hardware reset. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/manufacturer\_id**

---

Defined on file *sysfs-driver-ufs*

This file shows the manufacturee ID. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/manufacturing\_date**

---

Defined on file *sysfs-driver-ufs*

This file shows the manufacturing date in BCD format. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/number\_of\_luns**

---

Defined on file *sysfs-driver-ufs*

This file shows number of logical units. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/number\_of\_secure\_wpa**

---

Defined on file *sysfs-driver-ufs*

This file shows number of secure write protect areas supported by the device. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/number\_of\_wluns**

---

Defined on file *sysfs-driver-ufs*

This file shows number of well known logical units. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/protocol**

---

Defined on file *sysfs-driver-ufs*

This file shows the protocol supported by an UFS device. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/psa\_max\_data\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows the maximum amount of data that may be written during the pre-soldering phase of the PSA flow. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/psa\_state\_timeout**

---

Defined on file *sysfs-driver-ufs*

This file shows the command maximum timeout for a change in PSA state. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/queue\_depth**

---

Defined on file *sysfs-driver-ufs*

This file shows the device queue depth. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/rtc\_update**

---

Defined on file *sysfs-driver-ufs*

This file shows the frequency and method of the realtime clock update. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/rtt\_capability**

---

Defined on file *sysfs-driver-ufs*

This file shows the maximum number of outstanding RTTs supported by the device. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/secure\_removal\_type**

---

Defined on file *sysfs-driver-ufs*

This file shows the secure removal type. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/specification\_version**

---

Defined on file *sysfs-driver-ufs*

This file shows the specification version. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/support\_security\_lun**

---

Defined on file *sysfs-driver-ufs*

This file shows whether the security lun is supported. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/ufs\_features**

---

Defined on file *sysfs-driver-ufs*

This file shows which features are supported by the device. This is one of the UFS device descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/wb\_presv\_us\_en**

---

Defined on file *sysfs-driver-ufs*

This entry shows if preserve user-space was configured

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/wb\_shared\_alloc\_units**

---

Defined on file *sysfs-driver-ufs*

This entry shows the shared allocated units of WB buffer

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/device\_descriptor/wb\_type**

---

Defined on file *sysfs-driver-ufs*

This entry shows the configured WB type. 0x1 for shared buffer mode. 0x0 for dedicated buffer mode.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/flags/bkops\_enable**

---

Defined on file *sysfs-driver-ufs*

This file shows whether the device background operations are enabled. The full information about the flag could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/flags/busy\_RTC**

---

Defined on file *sysfs-driver-ufs*

This file shows whether the device is executing internal operation related to real time clock. The full information about the flag could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/flags/device\_init**

---

Defined on file *sysfs-driver-ufs*

This file shows the device init status. The full information about the flag could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/flags/disable\_fw\_update**

---

Defined on file *sysfs-driver-ufs*

This file shows whether the device FW update is permanently disabled. The full information about the flag could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/flags/life\_span\_mode\_enable**

---

Defined on file *sysfs-driver-ufs*

This file shows whether the device life span mode is enabled. The full information about the flag could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/flags/permanent\_wpe**

---

Defined on file *sysfs-driver-ufs*

This file shows whether permanent write protection is enabled. The full information about the flag could be found at UFS specifications 2.1.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/flags/phy\_resource\_removal**

Defined on file *sysfs-driver-ufs*

This file shows whether physical resource removal is enable. The full information about the flag could be found at UFS specifications 2.1.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/flags/power\_on\_wpe**

Defined on file *sysfs-driver-ufs*

This file shows whether write protection is enabled on all logical units configured as power on write protected. The full information about the flag could be found at UFS specifications 2.1.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/flags/wb\_enable**

Defined on file *sysfs-driver-ufs*

This entry shows the status of WriteBooster.

- |   |                              |
|---|------------------------------|
| 0 | WriteBooster is not enabled. |
| 1 | WriteBooster is enabled      |

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/flags/wb\_flush\_during\_h8**

Defined on file *sysfs-driver-ufs*

Flush WriteBooster Buffer during hibernate state.

- |   |   |
|---|---|
| 0 | Device is not allowed to flush the WriteBooster Buffer during link hibernate state. |
| 1 | Device is allowed to flush the WriteBooster Buffer during link hibernate state.     |

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/flags/wb\_flush\_en**

Defined on file *sysfs-driver-ufs*

This entry shows if flush is enabled.

---

0	Flush operation is not performed.
1	Flush operation is performed.

---

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/\*\_memory\_capacity\_adjustme**

---

Defined on file *sysfs-driver-ufs*

This file shows the memory capacity adjustment factor for different memory types (system code, non persistent, enhanced type 1-4). This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/\*\_memory\_max\_alloc\_units**

---

Defined on file *sysfs-driver-ufs*

This file shows the maximum number of allocation units for different memory types (system code, non persistent, enhanced type 1-4). This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/allocation\_unit\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows the allocation unit size. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/data\_ordering**

---

Defined on file *sysfs-driver-ufs*

This file shows support for out-of-order data transfer. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/dyn\_capacity\_resource\_policy**

---

Defined on file *sysfs-driver-ufs*

This file shows the dynamic capacity resource policy. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/max\_in\_buffer\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows the maximum data-in buffer size. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/max\_number\_of\_contexts**

---

Defined on file *sysfs-driver-ufs*

This file shows maximum available number of contexts which are supported by the device. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/max\_number\_of\_luns**

---

Defined on file *sysfs-driver-ufs*

This file shows the maximum number of logical units supported by the UFS device. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/max\_out\_buffer\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows the maximum data-out buffer size. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/memory\_types**

---

Defined on file *sysfs-driver-ufs*

This file shows supported memory types. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/min\_addressable\_block\_size**

Defined on file *sysfs-driver-ufs*

This file shows the minimum addressable block size. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/optimal\_read\_block\_size**

Defined on file *sysfs-driver-ufs*

This file shows the optimal read block size. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/optimal\_write\_block\_size**

Defined on file *sysfs-driver-ufs*

This file shows the optimal write block size. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/raw\_device\_capacity**

Defined on file *sysfs-driver-ufs*

This file shows the total memory quantity available to the user to configure the device logical units. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/rpmb\_rw\_size**

Defined on file *sysfs-driver-ufs*

This file shows the maximum number of RPMB frames allowed in Security Protocol In/Out. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/secure\_removal\_types**

---

Defined on file *sysfs-driver-ufs*

This file shows supported secure removal types. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/segment\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows the segment size. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/sys\_data\_tag\_resource\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows maximum storage area size allocated by the device to handle system data by the tagging mechanism. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/sys\_data\_tag\_unit\_size**

---

Defined on file *sysfs-driver-ufs*

This file shows system data tag unit size. This is one of the UFS geometry descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/wb\_buff\_cap\_adj**

---

Defined on file *sysfs-driver-ufs*

This entry shows the total user-space decrease in shared buffer mode. The value of this parameter is 3 for TLC NAND when SLC mode is used as WriteBooster Buffer. 2 for MLC NAND.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/wb\_max\_alloc\_units**

Defined on file *sysfs-driver-ufs*

This entry shows the Maximum total WriteBooster Buffer size which is supported by the entire device.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/wb\_max\_wb\_luns**

Defined on file *sysfs-driver-ufs*

This entry shows the maximum number of luns that can support WriteBooster.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/wb\_sup\_red\_type**

Defined on file *sysfs-driver-ufs*

The supportability of user space reduction mode and preserve user space mode. 00h: WriteBooster Buffer can be configured only in user space reduction type. 01h: WriteBooster Buffer can be configured only in preserve user space type. 02h: Device can be configured in either user space reduction type or preserve user space type.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/geometry\_descriptor/wb\_sup\_wb\_type**

Defined on file *sysfs-driver-ufs*

The supportability of WriteBooster Buffer type.

---

00h	LU based WriteBooster Buffer configuration
01h	Single shared WriteBooster Buffer configuration
02h	Supporting both LU based WriteBooster. Buffer and Single shared Write-Booster Buffer configuration

---

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/health\_descriptor/eol\_info**

Defined on file *sysfs-driver-ufs*

This file shows preend of life information. This is one of the UFS health descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/health\_descriptor/life\_time\_estimation\_a**

---

Defined on file *sysfs-driver-ufs*

This file shows indication of the device life time (method a). This is one of the UFS health descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/health\_descriptor/life\_time\_estimation\_b**

---

Defined on file *sysfs-driver-ufs*

This file shows indication of the device life time (method b). This is one of the UFS health descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/interconnect\_descriptor/mphy\_version**

---

Defined on file *sysfs-driver-ufs*

This file shows the MIPI M-PHY version number in BCD format. This is one of the UFS interconnect descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/interconnect\_descriptor/unipro\_version**

---

Defined on file *sysfs-driver-ufs*

This file shows the MIPI UniPro version number in BCD format. This is one of the UFS interconnect descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/power\_descriptor/active\_icc\_levels\_vcc\***

---

Defined on file *sysfs-driver-ufs*

This file shows maximum VCC, VCCQ and VCCQ2 value for active ICC levels from 0 to 15. This is one of the UFS power descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/rpm\_lvl**

Defined on file *sysfs-driver-ufs*

This entry could be used to set or show the UFS device runtime power management level. The current driver implementation supports 6 levels with next target states:

- 
- |   |  |
|---|--|
| 0 | an UFS device will stay active, an UIC link will stay active       |
| 1 | an UFS device will stay active, an UIC link will hibernate         |
| 2 | an UFS device will moved to sleep, an UIC link will stay active    |
| 3 | an UFS device will moved to sleep, an UIC link will hibernate      |
| 4 | an UFS device will be powered off, an UIC link will hibernate      |
| 5 | an UFS device will be powered off, an UIC link will be powered off |
- 

---

**/sys/bus/platform/drivers/ufshcd/\*/rpm\_target\_dev\_state**

Defined on file *sysfs-driver-ufs*

This entry shows the target power mode of an UFS device for the chosen runtime power management level.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/rpm\_target\_link\_state**

Defined on file *sysfs-driver-ufs*

This entry shows the target state of an UFS UIC link for the chosen runtime power management level.

The file is read only.

---

**/sys/bus/platform/drivers/ufshcd/\*/spm\_lvl**

Defined on file *sysfs-driver-ufs*

This entry could be used to set or show the UFS device system power management level. The current driver implementation supports 6 levels with next target states:

0	an UFS device will stay active, an UIC link will stay active
1	an UFS device will stay active, an UIC link will hibernate
2	an UFS device will moved to sleep, an UIC link will stay active
3	an UFS device will moved to sleep, an UIC link will hibernate
4	an UFS device will be powered off, an UIC link will hibernate
5	an UFS device will be powered off, an UIC link will be powered off

---

### **/sys/bus/platform/drivers/ufshcd/\*/spm\_target\_dev\_state**

---

Defined on file *sysfs-driver-ufs*

This entry shows the target power mode of an UFS device for the chosen system power management level.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/spm\_target\_link\_state**

---

Defined on file *sysfs-driver-ufs*

This entry shows the target state of an UFS UIC link for the chosen system power management level.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/string\_descriptors/manufacturer\_name**

---

Defined on file *sysfs-driver-ufs*

This file contains a device manufacturer name string. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/string\_descriptors/oem\_id**

---

Defined on file *sysfs-driver-ufs*

This file contains a OEM ID string. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/bus/platform/drivers/ufshcd/\*/string\_descriptors/product\_name**

---

Defined on file *sysfs-driver-ufs*

This file contains a product name string. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/string\_descriptors/product\_revision**

Defined on file *sysfs-driver-ufs*

This file contains a product revision string. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

### **/sys/bus/platform/drivers/ufshcd/\*/string\_descriptors/serial\_number**

Defined on file *sysfs-driver-ufs*

This file contains a device serial number string. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

### **/sys/bus/rapidio/devices/nn:d:iiii**

Defined on file *sysfs-bus-rapidio*

For each RapidIO device, the RapidIO subsystem creates files in an individual subdirectory with the following name format of device\_name “nn:d:iiii”, where:

nn	two-digit hexadecimal ID of RapidIO network where the device resides
d	device type: ‘e’ - for endpoint or ‘s’ - for switch
iiii	four-digit device destID for endpoints, or switchID for switches

For example, below is a list of device directories that represents a typical RapidIO network with one switch, one host, and two agent endpoints, as it is seen by the enumerating host (with destID = 1):

```
/sys/bus/rapidio/devices/00:e:0000
/sys/bus/rapidio/devices/00:e:0002
/sys/bus/rapidio/devices/00:s:0001
```

#### **NOTE:**

An enumerating or discovering endpoint does not create a sysfs entry for itself, this is why an endpoint with destID=1 is not shown in the list.

Attributes Common for All RapidIO Devices

### **/sys/bus/rapidio/devices/nn:d:iiii/asm\_did**

Defined on file *sysfs-bus-rapidio*

(RO) returns identifier for the assembly containing the device

### **/sys/bus/rapidio/devices/nn:d:iiii/asm\_rev**

Defined on file *sysfs-bus-rapidio*

(RO) returns revision level of the assembly containing the device

### **/sys/bus/rapidio/devices/nn:d:iiii/asm\_vid**

Defined on file *sysfs-bus-rapidio*

(RO) returns vendor identifier of the assembly containing the device

### **/sys/bus/rapidio/devices/nn:d:iiii/config**

Defined on file *sysfs-bus-rapidio*

(RW) Binary attribute to read from and write to the device configuration registers using the RapidIO maintenance transactions. This attribute is similar in behaviour to the “config” attribute of PCI devices and provides an access to the RapidIO device registers using standard file read and write operations.

#### RapidIO Switch Device Attributes

RapidIO switches have additional attributes in sysfs. RapidIO subsystem supports common and device-specific sysfs attributes for switches. Because switches are integrated into the RapidIO subsystem, it offers a method to create device-specific sysfs attributes by specifying a callback function that may be set by the switch initialization routine during enumeration or discovery process.

### **/sys/bus/rapidio/devices/nn:d:iiii/destid**

Defined on file *sysfs-bus-rapidio*

(RO) returns device destination ID assigned by the enumeration routine

### **/sys/bus/rapidio/devices/nn:d:iiii/device\_rev**

Defined on file *sysfs-bus-rapidio*

(RO) returns the device revision level

### **/sys/bus/rapidio/devices/nn:d:iiii/did**

Defined on file *sysfs-bus-rapidio*

(RO) returns the device identifier

### **/sys/bus/rapidio/devices/nn:d:iiii/lprev**

Defined on file *sysfs-bus-rapidio*

(RO) returns name of previous device (switch) on the path to the device that that owns this attribute

---

**/sys/bus/rapidio/devices/nn:d:iiii/modalias**

---

Defined on file *sysfs-bus-rapidio*

(RO) returns the device modalias

---

**/sys/bus/rapidio/devices/nn:d:iiii/vid**

---

Defined on file *sysfs-bus-rapidio*

(RO) returns the device vendor identifier

---

**/sys/bus/rapidio/devices/nn:s:iiii/destid**

---

Defined on file *sysfs-bus-rapidio*

(RO) device destination ID of the associated device that defines a route to the switch

---

**/sys/bus/rapidio/devices/nn:s:iiii/errlog**

---

Defined on file *sysfs-bus-rapidio*

(RO) reads contents of device error log until it is empty.

RapidIO Bus Attributes

---

**/sys/bus/rapidio/devices/nn:s:iiii/hopcount**

---

Defined on file *sysfs-bus-rapidio*

(RO) number of hops on the path to the switch

---

**/sys/bus/rapidio/devices/nn:s:iiii/lnext**

---

Defined on file *sysfs-bus-rapidio*

(RO) returns names of devices linked to the switch except one of a device linked to the ingress port (reported as “lprev” ). This is an array names with number of lines equal to number of ports in switch. If a switch port has no attached device, returns “null” instead of a device name.

Device-specific Switch Attributes

IDT\_GEN2-

---

**/sys/bus/rapidio/devices/nns:iiii/routes**

---

Defined on file *sysfs-bus-rapidio*

(RO) reports switch routing information in “destID port” format. This attribute reports only valid routing table entries, one line for each entry.

---

**/sys/bus/rapidio/scan**

---

Defined on file *sysfs-bus-rapidio*

(WO) Allows to trigger enumeration discovery process from user space. To initiate an enumeration or discovery process on specific mport device, a user needs to write mport\_ID (not RapidIO destination ID) into this file. The mport\_ID is a sequential number (0 …RIO\_MAX\_MPORTS) assigned to the mport device. For example, for a machine with a single RapidIO controller, mport\_ID for that controller always will be 0. To initiate RapidIO enumeration/discovery on all available mports a user must write ‘-1’ (or RIO\_MPRT\_ANY) into this attribute file.

---

**/sys/bus/rbd/add**

---

Defined on file *sysfs-bus-rbd*

(WO) Add rbd block device.

Usage: <mon ip addr> <options> <pool name> <rbd image name> [<snap name>]

Example:

```
$ echo "192.168.0.1 name=admin rbd foo" > :ref:`\sys\bus\rbd\`  
→add <abi_sys_bus_rbd_add>
```

The snapshot name can be “-” or omitted to map the image read/write. A <dev-id> will be assigned for any registered block device. If snapshot is used, it will be mapped read-only.

---

**/sys/bus/rbd/add\_single\_major**

---

Defined on file *sysfs-bus-rbd*

(WO) Available only if rbd module is inserted with single\_major parameter set to true.

Usage is the same as for [/sys/bus/rbd/add](#). If present, this should be used instead of the latter: any attempts to use [/sys/bus/rbd/add](#) if /sys/bus/rbd/add\_single\_major is available will fail for backwards compatibility reasons.

---

**/sys/bus/rbd/devices/<dev-id>/image\_id**  
**/sys/bus/rbd/devices/<dev-id>/features**

---

Defined on file [sysfs-bus-rbd](#)

image_id	(RO) The unique id for the rbd image. (For rbd image format 1 this is empty.)
features	(RO) A hexadecimal encoding of the feature bits for this image.

### /sys/bus/rbd/devices/<dev-id>/minor

Defined on file [sysfs-bus-rbd](#)

(RO) The block device minor number.

### /sys/bus/rbd/devices/<dev-id>/parent

Defined on file [sysfs-bus-rbd](#)

(RO) Information identifying the chain of parent images in a layered rbd image. Entries are separated by empty lines.

### /sys/bus/rbd/devices/<dev-id>/pool\_id

Defined on file [sysfs-bus-rbd](#)

(RO) The unique identifier for the rbd image's pool. This is a permanent attribute of the pool. A pool's id will never change.

### /sys/bus/rbd/devices/<dev-id>/size /sys/bus/rbd/devices/<dev-id>/major /sys/bus/rbd/devices/<dev-id>/client\_id /sys/bus/rbd/devices/<dev-id>/pool /sys/bus/rbd/devices/<dev-id>/name /sys/bus/rbd/devices/<dev-id>/refresh /sys/bus/rbd/devices/<dev-id>/current\_snap

Defined on file [sysfs-bus-rbd](#)

size	(RO) The size (in bytes) of the mapped block device.
major	(RO) The block device major number.
client_id	(RO) The ceph unique client id that was assigned for this specific session.
pool	(RO) The name of the storage pool where this rbd image resides. An rbd image name is unique within its pool.
name	(RO) The name of the rbd image.
refresh	(WO) Writing to this file will reread the image header data and set all relevant data structures accordingly.
cur- rent_snap	(RO) The current snapshot for which the device is mapped.

---

/sys/bus/rbd/devices/<dev-id>/snap_id
/sys/bus/rbd/devices/<dev-id>/config_info
/sys/bus/rbd/devices/<dev-id>/cluster_fsid
/sys/bus/rbd/devices/<dev-id>/client_addr

---

Defined on file *sysfs-bus-rbd*

---

snap_i (RO) The current snapshot's id.
con- (RO) The string written into /sys/bus/rbd/add{,_single_major}.
fig_inf
clus- (RO) The ceph cluster UUID.
ter_fsi
client_ (RO) The ceph unique client entity_addr_t (address + nonce). The format is <address>:<port>/<nonce>: '1.2.3.4:1234/5678' or '[1:2:3:4:5:6:7:8]:1234/5678' .

---

### /sys/bus/rbd/remove

Defined on file *sysfs-bus-rbd*

(WO) Remove rbd block device.

Usage: <dev-id> [force]

Example:

```
$ echo 2 > :ref:`\sys\bus\rbd\remove <abi_sys_bus_rbd_remove>`
```

Optional “force” argument which when passed will wait for running requests and then unmap the image. Requests sent to the driver after initiating the removal will be failed. (August 2016, since 4.9.)

### /sys/bus/rbd/remove\_single\_major

Defined on file *sysfs-bus-rbd*

(WO) Available only if rbd module is inserted with single\_major parameter set to true.

Usage is the same as for [/sys/bus/rbd/remove](#). If present, this should be used instead of the latter: any attempts to use [/sys/bus/rbd/remove](#) if /sys/bus/rbd/remove\_single\_major is available will fail for backwards compatibility reasons.

### /sys/bus/rbd/supported\_features

Defined on file *sysfs-bus-rbd*

(RO) Displays the features supported by the rbd module so that userspace can generate meaningful error messages and spell out unsupported features that need to be disabled.

---

**/sys/bus/rpmsg/devices/…/announce**

---

Defined on file *sysfs-bus-rpmsg*

Every rpmsg device is a communication channel with a remote processor. Channels are identified by a textual name (see /sys/bus/rpmsg/devices/…/name above) and have a local ( “source” ) rpmsg address, and remote ( “destination” ) rpmsg address.

A channel is first created when an entity, whether local or remote, starts listening on it for messages (and is thus called an rpmsg server).

When that happens, a “name service” announcement is sent to the other processor, in order to let it know about the creation of the channel (this way remote clients know they can start sending messages).

This sysfs entry tells us whether the channel is a local server channel that is announced (values are either true or false).

---

**/sys/bus/rpmsg/devices/…/driver\_override**

---

Defined on file *sysfs-bus-rpmsg*

Every rpmsg device is a communication channel with a remote processor. Channels are identified by a textual name (see /sys/bus/rpmsg/devices/…/name above) and have a local ( “source” ) rpmsg address, and remote ( “destination” ) rpmsg address.

The listening entity (or client) which communicates with a remote processor is referred as rpmsg driver. The rpmsg device and rpmsg driver are matched based on rpmsg device name and rpmsg driver ID table.

This sysfs entry allows the rpmsg driver for a rpmsg device to be specified which will override standard OF, ID table and name matching.

---

**/sys/bus/rpmsg/devices/…/dst**

---

Defined on file *sysfs-bus-rpmsg*

Every rpmsg device is a communication channel with a remote processor. Channels have a local ( “source” ) rpmsg address, and remote ( “destination” ) rpmsg address. When an entity starts listening on one end of a channel, it assigns it with a unique rpmsg address (a 32 bits integer). This way when inbound messages arrive to this address, the rpmsg core dispatches them to the listening entity.

This sysfs entry contains the dst (remote) rpmsg address of this channel. If it contains 0xffffffff, then an address wasn’t assigned (can happen if the kernel driver that is attached to this channel is exposing a service to the remote processor. This

make it a local rpmsg server, and it is listening for inbound messages that may be sent from any remote rpmsg client; it is not bound to a single remote entity).

### /sys/bus/rpmsg/devices/…/name

Defined on file *sysfs-bus-rpmsg*

Every rpmsg device is a communication channel with a remote processor. Channels are identified with a (textual) name, which is maximum 32 bytes long (defined as RPMSG\_NAME\_SIZE in rpmsg.h).

This sysfs entry contains the name of this channel.

### /sys/bus/rpmsg/devices/…/src

Defined on file *sysfs-bus-rpmsg*

Every rpmsg device is a communication channel with a remote processor. Channels have a local ( “source” ) rpmsg address, and remote ( “destination” ) rpmsg address. When an entity starts listening on one end of a channel, it assigns it with a unique rpmsg address (a 32 bits integer). This way when inbound messages arrive to this address, the rpmsg core dispatches them to the listening entity (a kernel driver).

This sysfs entry contains the src (local) rpmsg address of this channel. If it contains 0xffffffff, then an address wasn’ t assigned (can happen if no driver exists for this channel).

### /sys/bus/scsi/drivers/st/debug\_flag

Defined on file *sysfs-driver-st*

This file allows you to turn debug output from the st driver off if you write a ‘0’ to the file or on if you write a ‘1’ . Note that debug output requires that the module be compiled with the #define DEBUG set to a non-zero value (this is the default). If DEBUG is set to 0 then this file will not appear in sysfs as its presence is conditional upon debug output support being compiled into the module.

### /sys/bus/siox/devices/siox-X-Y/connected

Defined on file *sysfs-bus-siox*

Read-only value. “0” means the Yth device on siox bus X isn’ t “connected” i.e. communication with it is not ensured. “1” signals a working connection.

### /sys/bus/siox/devices/siox-X-Y/inbytes

Defined on file *sysfs-bus-siox*

Read-only value reporting the inbytes value provided to siox-X/device\_add

### **/sys/bus/siox/devices/siox-X-Y/outbytes**

Defined on file *sysfs-bus-siox*

Read-only value reporting the outbytes value provided to siox-X/device\_add.

### **/sys/bus/siox/devices/siox-X-Y/status\_errors**

Defined on file *sysfs-bus-siox*

Counts the number of time intervals when the read status byte doesn't yield the expected value.

### **/sys/bus/siox/devices/siox-X-Y/type**

Defined on file *sysfs-bus-siox*

Read-only value reporting the type value provided to siox-X/device\_add.

### **/sys/bus/siox/devices/siox-X-Y/watchdog**

Defined on file *sysfs-bus-siox*

Read-only value reporting if the watchdog of the siox device is active. “0” means the watchdog is not active and the device is expected to be operational. “1” means the watchdog keeps the device in reset.

### **/sys/bus/siox/devices/siox-X-Y/watchdog\_errors**

Defined on file *sysfs-bus-siox*

Read-only value reporting the number of time intervals when the watchdog was active.

### **/sys/bus/siox/devices/siox-X/active**

Defined on file *sysfs-bus-siox*

On reading represents the current state of the bus. If it contains a “0” the bus is stopped and connected devices are expected to not do anything because their watchdog triggered. When the file contains a “1” the bus is operated and periodically does a push-pull cycle to write and read data from the connected devices.

When writing a “0” or “1” the bus moves to the described state.

### **/sys/bus/siox/devices/siox-X/device\_add**

Defined on file *sysfs-bus-siox*

Write-only file. Write

```
<type> <inbytes> <outbytes> <statustype>
```

to add a new device dynamically. `<type>` is the name that is used to match to a driver (similar to the platform bus). `<inbytes>` and `<outbytes>` define the length of the input and output shift register in bytes respectively.

`<statustype>` defines the 4 bit device type that is checked to identify connection problems.

The new device is added to the end of the existing chain.

---

```
/sys/bus/siox/devices/siox-X/device_remove
```

---

Defined on file [sysfs-bus-siox](#)

Write-only file. A single write removes the last device in the siox chain.

---

```
/sys/bus/siox/devices/siox-X/poll_interval_ns
```

---

Defined on file [sysfs-bus-siox](#)

Defines the interval between two poll cycles in nano seconds. Note this is rounded to jiffies on writing. On reading the current value is returned.

---

```
/sys/bus/soc
```

---

Defined on file [sysfs-devices-soc](#)

The `/sys/bus/soc/` directory contains the usual sub-folders expected under most buses. `/sys/bus/soc/devices` is of particular interest, as it contains a symlink for each SoC device found on the system. Each symlink points back into the aforementioned `/sys/devices/socX` devices.

---

```
/sys/bus/soundwire/devices/sdw-master-N/revision
```

---

Defined on file [sysfs-bus-soundwire-master](#)

SoundWire Master-N DisCo properties. These properties are defined by MIPI DisCo Specification for SoundWire. They define various properties of the Master and are used by the bus to configure the Master. `clk_stop_modes` is a bitmask for simplifications and combines the `clock-stop-mode0` and `clock-stop-mode1` properties.

---

```
/sys/bus/soundwire/devices/sdw:.../dev-properties/mipi_revision
```

---

Defined on file [sysfs-bus-soundwire-slave](#)

SoundWire Slave DisCo properties. These properties are defined by MIPI DisCo Specification for SoundWire. They define various properties of the SoundWire Slave and are used by the bus to configure the Slave

---

**/sys/bus/soundwire/devices/sdw:…/dp0/max\_word**

Defined on file *sysfs-bus-soundwire-slave*

SoundWire Slave Data Port-0 DisCo properties. These properties are defined by MIPI DisCo Specification for the SoundWire. They define various properties of the Data port 0 are used by the bus to configure the Data Port 0.

---

**/sys/bus/soundwire/devices/sdw:…/dpN\_src/max\_word**

Defined on file *sysfs-bus-soundwire-slave*

SoundWire Slave Data Source/Sink Port-N DisCo properties. These properties are defined by MIPI DisCo Specification for SoundWire. They define various properties of the Source/Sink Data port N and are used by the bus to configure the Data Port N.

---

**/sys/bus/soundwire/devices/sdw:…/status**

Defined on file *sysfs-bus-soundwire-slave*

SoundWire Slave status

These properties report the Slave status, e.g. if it is UNATTACHED or not, and in the latter case show the device\_number. This status information is useful to detect devices exposed by platform firmware but not physically present on the bus, and conversely devices not exposed in platform firmware but enumerated.

---

**/sys/bus/spi/devices/…/bmc\_version**

Defined on file *sysfs-driver-intel-m10-bmc*

Read only. Returns the hardware build version of Intel MAX10 BMC chip. Format: “0x%x” .

---

**/sys/bus/spi/devices/…/bmcfw\_version**

Defined on file *sysfs-driver-intel-m10-bmc*

Read only. Returns the firmware version of Intel MAX10 BMC chip. Format: “0x%x” .

---

**/sys/bus/tee/devices/optee-ta-<uuid>/**

Defined on file *sysfs-bus-optee-devices*

OP-TEE bus provides reference to registered drivers under this directory. The <uuid> matches Trusted Application (TA) driver and corresponding TA in secure OS. Drivers are free to create needed API under optee-ta-<uuid> directory.

### **/sys/bus/tee/devices/optee-ta-<uuid>/need\_supplicant**

Defined on file *sysfs-bus-optee-devices*

Allows to distinguish whether an OP-TEE based TA/device requires user-space tee-supplicant to function properly or not. This attribute will be present for devices which depend on tee-supplicant to be running.

### **/sys/bus/thunderbolt/devices/…/authorized**

Defined on file *sysfs-bus-thunderbolt*

This attribute is used to authorize Thunderbolt devices after they have been connected. If the device is not authorized, no devices such as PCIe and Display port are available to the system.

Contents of this attribute will be 0 when the device is not yet authorized.

Possible values are supported:

- |   |   |
|---|---|
| 1 | The device will be authorized and connected |
|---|---|

When key attribute contains 32 byte hex string the possible values are:

- |   |   |
|---|---|
| 1 | The 32 byte hex string is added to the device NVM and the device is authorized.   |
| 2 | Send a challenge based on the 32 byte hex string. If the challenge response from device is valid, the device is authorized. In case of failure errno will be ENOKEY if the device did not contain a key at all, and EKEYREJECTED if the challenge response did not match. |

### **/sys/bus/thunderbolt/devices/…/boot**

Defined on file *sysfs-bus-thunderbolt*

This attribute contains 1 if Thunderbolt device was already authorized on boot and 0 otherwise.

### **/sys/bus/thunderbolt/devices/…/device**

Defined on file *sysfs-bus-thunderbolt*

This attribute contains id of this device extracted from the device DROM.

### **/sys/bus/thunderbolt/devices/…/device\_name**

Defined on file *sysfs-bus-thunderbolt*

This attribute contains name of this device extracted from the device DROM.

---

**/sys/bus/thunderbolt/devices/…/domainX/boot\_acl**

Defined on file *sysfs-bus-thunderbolt*

Holds a comma separated list of device unique\_ids that are allowed to be connected automatically during system startup (e.g boot devices). The list always contains maximum supported number of unique\_ids where unused entries are empty. This allows the userspace software to determine how many entries the controller supports. If there are multiple controllers, each controller has its own ACL list and size may be different between the controllers.

System BIOS may have an option “Preboot ACL” or similar that needs to be selected before this list is taken into consideration.

Software always updates a full list in each write.

If a device is authorized automatically during boot its boot attribute is set to 1.

---

**/sys/bus/thunderbolt/devices/…/domainX/iommu\_dma\_protection**

Defined on file *sysfs-bus-thunderbolt*

This attribute tells whether the system uses IOMMU for DMA protection. Value of 1 means IOMMU is used 0 means it is not (DMA protection is solely based on Thunderbolt security levels).

---

**/sys/bus/thunderbolt/devices/…/domainX/security**

Defined on file *sysfs-bus-thunderbolt*

This attribute holds current Thunderbolt security level set by the system BIOS. Possible values are:

none	All devices are automatically authorized
user	Devices are only authorized based on writing appropriate value to the authorized attribute
se-	Require devices that support secure connect at minimum. User needs to authorize each device.
dpon	Automatically tunnel Display port (and USB). No PCIe tunnels are created.
us- bonly	Automatically tunnel USB controller of the connected Thunderbolt dock (and Display Port). All PCIe links downstream of the dock are removed.

---

**/sys/bus/thunderbolt/devices/…/generation**

Defined on file *sysfs-bus-thunderbolt*

This attribute contains the generation of the Thunderbolt controller associated with the device. It will contain 4 for USB4.

### **/sys/bus/thunderbolt/devices/…/key**

Defined on file *sysfs-bus-thunderbolt*

When a devices supports Thunderbolt secure connect it will have this attribute. Writing 32 byte hex string changes authorization to use the secure connection method instead. Writing an empty string clears the key and regular connection method can be used again.

### **/sys/bus/thunderbolt/devices/…/nvm\_authenticate**

Defined on file *sysfs-bus-thunderbolt*

When new NVM image is written to the non-active NVM area (through non\_activeX NVMem device), the authentication procedure is started by writing to this file. If everything goes well, the device is restarted with the new NVM firmware. If the image verification fails an error code is returned instead.

This file will accept writing values “1” or “2”

- Writing “1” will flush the image to the storage area and authenticate the image in one action.
- Writing “2” will run some basic validation on the image and flush it to the storage area.

When read holds status of the last authentication operation if an error occurred during the process. This is directly the status value from the DMA configuration based mailbox before the device is power cycled. Writing 0 here clears the status.

### **/sys/bus/thunderbolt/devices/…/nvm\_authenticate\_on\_disconnect**

Defined on file *sysfs-bus-thunderbolt*

For supported devices, automatically authenticate the new Thunderbolt image when the device is disconnected from the host system.

This file will accept writing values “1” or “2”

- Writing “1” will flush the image to the storage area and prepare the device for authentication on disconnect.
- Writing “2” will run some basic validation on the image and flush it to the storage area.

### **/sys/bus/thunderbolt/devices/…/nvm\_version**

Defined on file *sysfs-bus-thunderbolt*

If the device has upgradeable firmware the version number is available here. Format: %x.%x, major.minor. If the device is in safe mode reading the file returns -ENODATA instead as the NVM version is not available.

---

### **/sys/bus/thunderbolt/devices/…/rx\_lanes**

---

Defined on file *sysfs-bus-thunderbolt*

This attribute reports number of RX lanes the device is using simultaneously through its upstream port.

---

### **/sys/bus/thunderbolt/devices/…/rx\_speed**

---

Defined on file *sysfs-bus-thunderbolt*

This attribute reports the device RX speed per lane. All RX lanes run at the same speed.

---

### **/sys/bus/thunderbolt/devices/…/tx\_lanes**

---

Defined on file *sysfs-bus-thunderbolt*

This attribute reports number of TX lanes the device is using simultaneously through its upstream port.

---

### **/sys/bus/thunderbolt/devices/…/tx\_speed**

---

Defined on file *sysfs-bus-thunderbolt*

This attribute reports the TX speed per lane. All TX lanes run at the same speed.

---

### **/sys/bus/thunderbolt/devices/…/unique\_id**

---

Defined on file *sysfs-bus-thunderbolt*

This attribute contains unique\_id string of this device. This is either read from hardware registers (UUID on newer hardware) or based on UID from the device DROM. Can be used to uniquely identify particular device.

---

### **/sys/bus/thunderbolt/devices/…/vendor**

---

Defined on file *sysfs-bus-thunderbolt*

This attribute contains vendor id of this device extracted from the device DROM.

---

### **/sys/bus/thunderbolt/devices/…/vendor\_name**

---

Defined on file *sysfs-bus-thunderbolt*

This attribute contains vendor name of this device extracted from the device DROM.

### /sys/bus/thunderbolt/devices/<device>:<port>.<index>/device

Defined on file *sysfs-bus-thunderbolt*

Retimer device identifier read from the hardware.

### /sys/bus/thunderbolt/devices/<device>:<port>.<index>/nvm\_authenticate

Defined on file *sysfs-bus-thunderbolt*

When new NVM image is written to the non-active NVM area (through non\_activeX NVMem device), the authentication procedure is started by writing 1 to this file. If everything goes well, the device is restarted with the new NVM firmware. If the image verification fails an error code is returned instead.

When read holds status of the last authentication operation if an error occurred during the process. Format: %x.

### /sys/bus/thunderbolt/devices/<device>:<port>.<index>/nvm\_version

Defined on file *sysfs-bus-thunderbolt*

Holds retimer NVM version number. Format: %x.%x, major.minor.

### /sys/bus/thunderbolt/devices/<device>:<port>.<index>/vendor

Defined on file *sysfs-bus-thunderbolt*

Retimer vendor identifier read from the hardware.

### /sys/bus/thunderbolt/devices/<xdomain>.<service>/key

Defined on file *sysfs-bus-thunderbolt*

This contains name of the property directory the XDomain service exposes. This entry describes the protocol in question. Following directories are already reserved by the Apple XDomain specification:

network	IP/ethernet over Thunderbolt
targetdm	Target disk mode protocol over Thunderbolt
extdisp	External display mode protocol over Thunderbolt

### /sys/bus/thunderbolt/devices/<xdomain>.<service>/modalias

Defined on file *sysfs-bus-thunderbolt*

Stores the same MODALIAS value emitted by uevent for the XDomain service. Format: tbtsvc:kSpNvNrN

---

**/sys/bus/thunderbolt/devices/<xdomain>.<service>/prtcid**

---

Defined on file *sysfs-bus-thunderbolt*

This contains XDomain protocol identifier the XDomain service supports.

---

**/sys/bus/thunderbolt/devices/<xdomain>.<service>/prtcrevs**

---

Defined on file *sysfs-bus-thunderbolt*

This contains XDomain software version the XDomain service supports.

---

**/sys/bus/thunderbolt/devices/<xdomain>.<service>/prtcstns**

---

Defined on file *sysfs-bus-thunderbolt*

This contains XDomain service specific settings as bitmask. Format: %x

---

**/sys/bus/thunderbolt/devices/<xdomain>.<service>/prtcvers**

---

Defined on file *sysfs-bus-thunderbolt*

This contains XDomain protocol version the XDomain service supports.

---

**/sys/bus/typec/devices/…/active**

---

Defined on file *sysfs-bus-typec*

Shows if the mode is active or not. The attribute can be used for entering/exiting the mode. Entering/exiting modes is supported as synchronous operation so write(2) to the attribute does not return until the enter/exit mode operation has finished. The attribute is notified when the mode is entered/exited so poll(2) on the attribute wakes up. Entering/exiting a mode will also generate uevent KOBJ\_CHANGE.

Valid values are boolean.

---

**/sys/bus/typec/devices/…/description**

---

Defined on file *sysfs-bus-typec*

Shows description of the mode. The description is optional for the drivers, just like with the Billboard Devices.

---

**/sys/bus/typec/devices/…/displayport/configuration**

---

Defined on file *sysfs-driver-typec-displayport*

Shows the current DisplayPort configuration for the connector. Valid values are USB, source and sink. Source means DisplayPort source, and sink means DisplayPort sink.

All supported configurations are listed as space separated list with the active one wrapped in square brackets.

Source example:

```
USB [source] sink
```

The configuration can be changed by writing to the file

Note. USB configuration does not equal to Exit Mode. It is separate configuration defined in VESA DisplayPort Alt Mode on USB Type-C Standard. Functionally it equals to the situation where the mode has been exited (to exit the mode, see [testing/sysfs-bus-typec](#), and use file /sys/bus/typec/devices/…/active).

### **/sys/bus/typec/devices/…/displayport/pin\_assignment**

Defined on file [sysfs-driver-typec-displayport](#)

VESA DisplayPort Alt Mode on USB Type-C Standard defines six different pin assignments for USB Type-C connector that are labeled A, B, C, D, E, and F. The supported pin assignments are listed as space separated list with the active one wrapped in square brackets.

Example:

```
C [D]
```

Pin assignment can be changed by writing to the file. It is possible to set pin assignment before configuration has been set, but the assignment will not be active before the connector is actually configured.

Note. As of VESA DisplayPort Alt Mode on USB Type-C Standard version 1.0b, pin assignments A, B, and F are deprecated. Only pin assignment D can now carry simultaneously one channel of USB SuperSpeed protocol. From user perspective pin assignments C and E are equal, where all channels on the connector are used for carrying DisplayPort protocol (allowing higher resolutions).

### **/sys/bus/typec/devices/…/mode**

Defined on file [sysfs-bus-typec](#)

The index number of the mode returned by Discover Modes USB Power Delivery command. Depending on the alternate mode, the mode index may be significant.

With some alternate modes (SVIDs), the mode index is assigned for specific functionality in the specification for that alternate mode.

With other alternate modes, the mode index values are not assigned, and can not be therefore used for identification. When the mode index is not assigned, identifying the alternate mode must be done with either mode VDO or the description.

### **/sys/bus/typec/devices/…/svid**

Defined on file *sysfs-bus-typec*

The Standard or Vendor ID (SVID) assigned by USB-IF for this alternate mode.

### **/sys/bus/typec/devices/…/vdo**

Defined on file *sysfs-bus-typec*

Shows the VDO in hexadecimal returned by Discover Modes command for this mode.

### **/sys/bus/umc/**

Defined on file *sysfs-bus-umc*

The Wireless Host Controller Interface (WHCI) specification describes a PCI-based device with multiple capabilities; the UWB Multi-interface Controller (UMC).

The umc bus presents each of the individual capabilties as a device.

### **/sys/bus/umc/devices/…/capability\_id**

Defined on file *sysfs-bus-umc*

The ID of this capability, with 0 being the radio controller capability.

### **/sys/bus/umc/devices/…/version**

Defined on file *sysfs-bus-umc*

The specification version this capability's hardware interface complies with.

### **/sys/bus/usb-serial/drivers/…/new\_id**

Defined on file *sysfs-bus-usb*

For serial USB drivers, this attribute appears under the extra bus folder “usb-serial” in sysfs; apart from that difference, all descriptions from the entry “/sys/bus/usb/drivers/…/new\_id” apply.

### **/sys/bus/usb/…/decimals**

Defined on file *sysfs-bus-usb-devices-usbsevseg*

Controls the decimal places on the device. To set the nth decimal place, give this field the value of  $10^{**n}$ . Assume this field has the value k and has 1 or more

decimal places set, to set the mth place (where m is not already set), change this fields value to k + 10 \*\* m.

---

<b>/sys/bus/usb/…/mode_msb</b>
<b>/sys/bus/usb/…/mode_lsb</b>

---

Defined on file *sysfs-bus-usb-devices-usbseg*

Controls the devices display mode. For a 6 character display the values are

MSB 0x06; LSB 0x3F, and

for an 8 character display the values are

MSB 0x08; LSB 0xFF.

---

<b>/sys/bus/usb/…/powered</b>
-------------------------------

---

Defined on file *sysfs-bus-usb-devices-usbseg*

Controls whether the device's display will powered. A value of 0 is off and a non-zero value is on.

---

<b>/sys/bus/usb/…/text</b>
----------------------------

---

Defined on file *sysfs-bus-usb-devices-usbseg*

The text (or data) for the device to display

---

<b>/sys/bus/usb/…/textmode</b>
--------------------------------

---

Defined on file *sysfs-bus-usb-devices-usbseg*

Controls the way the device interprets its text buffer. raw: each character controls its segment manually hex: each character is between 0-15 ascii: each character is between '0' - '9' and 'A' - 'F' .

---

<b>/sys/bus/usb/device/…/authorized</b>
---

---

Defined on file *sysfs-bus-usb*

Authorized devices are available for use by device drivers, non-authorized one are not. By default, wired USB devices are authorized.

Certified Wireless USB devices are not authorized initially and should be (by writing 1) after the device has been authenticated.

---

<b>/sys/bus/usb/device/…/wusb_cdid</b>
--

---

Defined on file *sysfs-bus-usb*

For Certified Wireless USB devices only.

A devices' s CDID, as 16 space-separated hex octets.

---

### **/sys/bus/usb/device/…/wusb\_ck**

---

Defined on file *sysfs-bus-usb*

For Certified Wireless USB devices only.

Write the device' s connection key (CK) to start the authentication of the device. The CK is 16 space-separated hex octets.

---

### **/sys/bus/usb/device/…/wusb\_disconnect**

---

Defined on file *sysfs-bus-usb*

For Certified Wireless USB devices only.

Write a 1 to force the device to disconnect (equivalent to unplugging a wired USB device).

---

### **/sys/bus/usb/devices/…/(hub interface)/portX**

---

Defined on file *sysfs-bus-usb*

The /sys/bus/usb/devices/…/(hub interface)/portX is usb port device' s sysfs directory.

---

### **/sys/bus/usb/devices/…/(hub interface)/portX/connect\_type**

---

Defined on file *sysfs-bus-usb*

Some platforms provide usb port connect types through ACPI. This attribute is to expose these information to user space. The file will read “hotplug”, “hardwired” and “not used” if the information is available, and “unknown” otherwise.

---

### **/sys/bus/usb/devices/…/(hub interface)/portX/location**

---

Defined on file *sysfs-bus-usb*

Some platforms provide usb port physical location through firmware. This is used by the kernel to pair up logical ports mapping to the same physical connector. The attribute exposes the raw location value as a hex integer.

---

### **/sys/bus/usb/devices/…/(hub interface)/portX/over\_current\_count**

---

Defined on file *sysfs-bus-usb*

Most hubs are able to detect over-current situations on their ports and report them to the kernel. This attribute is to expose the number of over-current situation

occurred on a specific port to user space. This file will contain an unsigned 32 bit value which wraps to 0 after its maximum is reached. This file supports poll() for monitoring changes to this value in user space.

Any time this value changes the corresponding hub device will send a udev event with the following attributes:

```
OVER_CURRENT_PORT=/sys/bus/usb/devices/...(hub interface)/portX  
OVER_CURRENT_COUNT=[current value of this sysfs attribute]
```

### **/sys/bus/usb/devices/…/(hub interface)/portX/quirks**

Defined on file [sysfs-bus-usb](#)

In some cases, we care about time-to-active for devices connected on a specific port (e.g. non-standard USB port like pogo pins), where the device to be connected is known in advance, and behaves well according to the specification. This attribute is a bit-field that controls the behavior of a specific port:

- Bit 0 of this field selects the “old” enumeration scheme, as it is considerably faster (it only causes one USB reset instead of 2).

The old enumeration scheme can also be selected globally using /sys/module/usbcore/parameters/old\_scheme\_first, but it is often not desirable as the new scheme was introduced to increase compatibility with more devices.

- Bit 1 reduces TRSTRCY to the 10 ms that are required by the USB 2.0 specification, instead of the 50 ms that are normally used to help make enumeration work better on some high speed devices.

### **/sys/bus/usb/devices/…/(hub interface)/portX/usb3\_lpm\_permit**

Defined on file [sysfs-bus-usb](#)

Some USB3.0 devices are not friendly to USB3 LPM. usb3\_lpm\_permit attribute allows enabling/disabling usb3 lpm of a port. It takes effect both before and after a usb device is enumerated. Supported values are “0” if both u1 and u2 are NOT permitted, “u1” if only u1 is permitted, “u2” if only u2 is permitted, “u1\_u2” if both u1 and u2 are permitted.

### **/sys/bus/usb/devices/…/enable\_compliance**

Defined on file [sysfs-bus-usb-lvstest](#)

Write to this node to set the port to compliance mode to test with Link Layer Validation device. It is needed for TD.7.34.

### **/sys/bus/usb/devices/…/get\_dev\_desc**

Defined on file [sysfs-bus-usb-lvstest](#)

Write to this node to issue “Get Device Descriptor” for Link Layer Validation device. It is needed for TD.7.06.

---

**/sys/bus/usb/devices/…/hot\_reset**

Defined on file *sysfs-bus-usb-lvstest*

Write to this node to issue “Reset” for Link Layer Validation device. It is needed for TD.7.29, TD.7.31, TD.7.34 and TD.7.35.

---

**/sys/bus/usb/devices/…/ltm\_capable**

Defined on file *sysfs-bus-usb*

USB 3.0 devices may optionally support Latency Tolerance Messaging (LTM). They indicate their support by setting a bit in the bmAttributes field of their SuperSpeed BOS descriptors. If that bit is set for the device, ltm\_capable will read “yes”. If the device doesn’t support LTM, the file will read “no”. The file will be present for all speeds of USB devices, and will always read “no” for USB 1.1 and USB 2.0 devices.

---

**/sys/bus/usb/devices/…/power/usb2\_hardware\_lpm**

Defined on file *sysfs-bus-usb*

If CONFIG\_PM is set and a USB 2.0 lpm-capable device is plugged in to a xHCI host which support link PM, it will perform a LPM test; if the test is passed and host supports USB2 hardware LPM (xHCI 1.0 feature), USB2 hardware LPM will be enabled for the device and the USB device directory will contain a file named power/usb2\_hardware\_lpm. The file holds a string value (enable or disable) indicating whether or not USB2 hardware LPM is enabled for the device. Developer can write y/Y/1 or n/N/0 to the file to enable/disable the feature.

---

**/sys/bus/usb/devices/…/power/usb2\_lpm\_besl**

Defined on file *sysfs-bus-usb*

USB 2.0 devices that support hardware link power management (LPM) L1 sleep state now use a best effort service latency value (BESL) to indicate the best effort to resumption of service to the device after the initiation of the resume event. If the device does not have a preferred besl value then the host can select one instead. This usb2\_lpm\_besl attribute allows to tune the host selected besl value in order to tune power saving and service latency.

Supported values are 0 - 15. More information on how besl values map to microseconds can be found in USB 2.0 ECN Errata for Link Power Management, section 4.10)

---

**/sys/bus/usb/devices/…/power/usb2\_lpm\_l1\_timeout**

Defined on file *sysfs-bus-usb*

USB 2.0 devices may support hardware link power management (LPM) L1 sleep state. The `usb2_lpm_l1_timeout` attribute allows tuning the timeout for L1 inactivity timer (LPM timer), e.g. needed inactivity time before host requests the device to go to L1 sleep. Useful for power management tuning. Supported values are 0 - 65535 microseconds.

---

**/sys/bus/usb/devices/…/power/usb3\_hardware\_lpm\_u1**

---

Defined on file *sysfs-bus-usb*

If `CONFIG_PM` is set and a USB 3.0 lpm-capable device is plugged in to a xHCI host which supports link PM, it will check if U1 and U2 exit latencies have been set in the BOS descriptor; if the check is passed and the host supports USB3 hardware LPM, USB3 hardware LPM will be enabled for the device and the USB device directory will contain two files named `power/usb3_hardware_lpm_u1` and `power/usb3_hardware_lpm_u2`. These files hold a string value (enable or disable) indicating whether or not USB3 hardware LPM U1 or U2 is enabled for the device.

---

**/sys/bus/usb/devices/…/rx\_lanes**

---

Defined on file *sysfs-bus-usb*

Number of rx lanes the device is using. USB 3.2 adds Dual-lane support, 2 rx and 2 tx lanes over Type-C. Inter-Chip SSIC devices support asymmetric lanes up to 4 lanes per direction. Devices before USB 3.2 are single lane (`rx_lanes = 1`)

---

**/sys/bus/usb/devices/…/tx\_lanes**

---

Defined on file *sysfs-bus-usb*

Number of tx lanes the device is using. USB 3.2 adds Dual-lane support, 2 rx and 2 tx -lanes over Type-C. Inter-Chip SSIC devices support asymmetric lanes up to 4 lanes per direction. Devices before USB 3.2 are single lane (`tx_lanes = 1`)

---

**/sys/bus/usb/devices/…/u1\_timeout**

---

Defined on file *sysfs-bus-usb-lvstest*

Set “U1 timeout” for the downstream port where Link Layer Validation device is connected. Timeout value must be between 0 and 127. It is needed for TD.7.18, TD.7.19, TD.7.20 and TD.7.21.

---

**/sys/bus/usb/devices/…/u2\_timeout**

---

Defined on file *sysfs-bus-usb-lvstest*

Set “U2 timeout” for the downstream port where Link Layer Validation device is connected. Timeout value must be between 0 and 127. It is needed for TD.7.18, TD.7.19, TD.7.20 and TD.7.21.

---

**/sys/bus/usb/devices/…/u3\_entry**

---

Defined on file *sysfs-bus-usb-lvtest*

Write to this node to issue “U3 entry” for Link Layer Validation device. It is needed for TD.7.35 and TD.7.36.

---

**/sys/bus/usb/devices/…/u3\_exit**

---

Defined on file *sysfs-bus-usb-lvtest*

Write to this node to issue “U3 exit” for Link Layer Validation device. It is needed for TD.7.36.

---

**/sys/bus/usb/devices/…/warm\_reset**

---

Defined on file *sysfs-bus-usb-lvtest*

Write to this node to issue “Warm Reset” for Link Layer Validation device. It may be needed to properly reset an xHCI 1.1 host port if compliance mode needed to be explicitly enabled.

---

/sys/bus/usb/devices/<busnum>-<devnum>:<config num>. <interface num>/<hid-bus>:<vendor-id>:<product-id>. <num>/country
/sys/class/bluetooth/hci<addr>/<hid-bus>:<vendor-id>:<product-id>. <num>/country
/sys/class/hidraw/hidraw<num>/device/country

---

Defined on file *sysfs-driver-hid*

When read, this file returns the hex integer value in ASCII of the device’s HID country code (e.g. 21 for US). This file cannot be written.

---

/sys/bus/usb/devices/<busnum>-<devnum>:<config num>. <interface num>/<hid-bus>:<vendor-id>:<product-id>. <num>/dragging
---

---

Defined on file *sysfs-driver-hid-lenovo*

If this setting is enabled, it is possible to do dragging by pressing the trackpoint. This requires press\_to\_select to be enabled.

Values are 0 or 1.

Applies to Thinkpad USB Keyboard with TrackPoint.

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/fb_update_rate
```

Defined on file [sysfs-driver-hid-picolcd](#)

Make it possible to adjust defio refresh rate.

Reading: returns list of available refresh rates (expressed in Hz), the active refresh rate being enclosed in brackets ( '[' and ']' )

Writing: accepts new refresh rate expressed in integer Hz within permitted rates.

Note: As device can barely do 2 complete refreshes a second it only makes sense to adjust this value if only one or two tiles get changed and it's not appropriate to expect the application to flush its tiny changes explicitly at higher than default rate.

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/fn_lock
```

Defined on file [sysfs-driver-hid-lenovo](#)

This setting controls whether Fn Lock is enabled on the keyboard (i.e. if F1 is Mute or F1)

Values are 0 or 1

Applies to ThinkPad Compact (USB|Bluetooth) Keyboard with TrackPoint.

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kone/roccatkone<minor>/actual_dpi
```

Defined on file [sysfs-driver-hid-roccat-kone](#)

It is possible to switch the dpi setting of the mouse with the press of a button.

When read, this file returns the raw number of the actual dpi setting reported by the mouse. This number has to be further processed to receive the real dpi value:

VALUE	DPI
1	800
2	1200
3	1600
4	2000
5	2400
6	3200

This file is readonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kone/roccatkone<minor>/actual_profile
```

---

Defined on file [sysfs-driver-hid-roccat-kone](#)

When read, this file returns the number of the actual profile.

This file is readonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kone/roccatkone<minor>/firmware_version
```

---

Defined on file [sysfs-driver-hid-roccat-kone](#)

When read, this file returns the raw integer version number of the firmware reported by the mouse. Using the integer value eases further usage in other programs. To receive the real version number the decimal point has to be shifted 2 positions to the left. E.g. a returned value of 138 means 1.38

This file is readonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kone/roccatkone<minor>/profile[1-5]
```

---

Defined on file [sysfs-driver-hid-roccat-kone](#)

The mouse can store 5 profiles which can be switched by the press of a button. A profile holds information like button mappings, sensitivity, the colors of the 5 leds and light effects.

When read, these files return the respective profile. The returned data is 975 bytes in size.

When written, this file lets one write the respective profile data back to the mouse. The data has to be 975 bytes long.

The mouse will reject invalid data, whereas the profile number stored in the profile doesn't need to fit the number of the store.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kone/roccatkone<minor>/settings
```

---

Defined on file [sysfs-driver-hid-roccat-kone](#)

When read, this file returns the settings stored in the mouse. The size of the data is 36 bytes and holds information like the startup\_profile, tcu state and calibration\_data.

When written, this file lets write settings back to the mouse. The data has to be 36 bytes long. The mouse will reject invalid data.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kone/roccatkone<minor>/startup_profile
```

Defined on file *sysfs-driver-hid-roccat-kone*

The integer value of this attribute ranges from 1 to 5.

When read, this attribute returns the number of the profile that's active when the mouse is powered on.

When written, this file sets the number of the startup profile and the mouse activates this profile immediately.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kone/roccatkone<minor>/tcu
```

Defined on file *sysfs-driver-hid-roccat-kone*

The mouse has a “Tracking Control Unit” which lets the user calibrate the laser power to fit the mousepad surface. When read, this file returns the current state of the TCU, where 0 means off and 1 means on.

Writing 0 in this file will switch the TCU off.

Writing 1 in this file will start the calibration which takes around 6 seconds to complete and activates the TCU.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kone/roccatkone<minor>/weight
```

Defined on file *sysfs-driver-hid-roccat-kone*

The mouse can be equipped with one of four supplied weights ranging from 5 to 20 grams which are recognized by the mouse and its value can be read out. When read, this file returns the raw value returned by the mouse which eases further processing in other software.

The values map to the weights as follows:

VALUE	WEIGHT
0	none
1	5g
2	10g
3	15g
4	20g

This file is readonly.

Users: <http://roccat.sourceforge.net>

---

**/sys/bus/usb/devices/<busnum>-<devnum>:<config num>. <interface num>/<hid-bus>:<vendor-id>:<product-id>. <num>/operation\_mode**

---

Defined on file *sysfs-driver-hid-picolcd*

Make it possible to switch the PicoLCD device between LCD (firmware) and bootloader (flasher) operation modes.

Reading: returns list of available modes, the active mode being enclosed in brackets ( '[' and ']' )

Writing: causes operation mode switch. Permitted values are the non-active mode names listed when read.

Note: when switching mode the current PicoLCD HID device gets disconnected and reconnects after above delay (see attribute `operation_mode_delay` for its value).

---

**/sys/bus/usb/devices/<busnum>-<devnum>:<config num>. <interface num>/<hid-bus>:<vendor-id>:<product-id>. <num>/operation\_mode\_delay**

---

Defined on file *sysfs-driver-hid-picolcd*

Delay PicoLCD waits before restarting in new mode when `operation_mode` has changed.

Reading/Writing: It is expressed in ms and permitted range is 0..30000ms.

---

**/sys/bus/usb/devices/<busnum>-<devnum>:<config num>. <interface num>/<hid-bus>:<vendor-id>:<product-id>. <num>/press\_speed**

---

Defined on file *sysfs-driver-hid-lenovo*

This setting controls how fast the trackpoint needs to be pressed to generate a mouse click if `press_to_select` is enabled.

Values are decimal integers from 1 (slowest) to 255 (fastest).

Applies to Thinkpad USB Keyboard with TrackPoint.

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/press_to_select
```

Defined on file *sysfs-driver-hid-lenovo*

This controls if mouse clicks should be generated if the trackpoint is quickly pressed. How fast this press has to be is being controlled by press\_speed.

Values are 0 or 1.

Applies to Thinkpad USB Keyboard with TrackPoint.

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/quirks
```

Defined on file *sysfs-driver-hid-multitouch*

The integer value of this attribute corresponds to the quirks actually in place to handle the device's protocol. When read, this attribute returns the current settings (see MT\_QUIRKS\_\* in hid-multitouch.c). When written this attribute change on the fly the quirks, then the protocol to handle the device.

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/release_to_select
```

Defined on file *sysfs-driver-hid-lenovo*

For details regarding this setting please refer to <http://www.pc.ibm.com/ww/healthycomputing/trkpntb.html> Values are 0 or 1. Applies to Thinkpad USB Keyboard with TrackPoint.

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/report_descriptor  
/sys/class/bluetooth/hci<addr>/<hid-bus>:<vendor-id>:<product-id>.<num>/report_descriptor  
/sys/class/hidraw/hidraw<num>/device/report_descriptor
```

Defined on file *sysfs-driver-hid*

When read, this file returns the device's raw binary HID report descriptor. This file cannot be written.

Users: HIDAPI library (<http://www.signal11.us/oss/hidapi>)

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/select_right
```

Defined on file *sysfs-driver-hid-lenovo*

This setting controls if the mouse click events generated by pressing the trackpoint (if press\_to\_select is enabled) generate a left or right mouse button click.

Values are 0 or 1.

Applies to Thinkpad USB Keyboard with TrackPoint.

---

**/sys/bus/usb/devices/<busnum>-<devnum>:<config num>. <interface num>/<hid-bus>:<vendor-id>:<product-id>. <num>/sensitivity**

---

Defined on file *sysfs-driver-hid-lenovo*

This file contains the trackpoint sensitivity. Values are decimal integers from 1 (lowest sensitivity) to 255 (highest sensitivity). Applies to Thinkpad USB Keyboard with TrackPoint.

---

**/sys/bus/usb/devices/INTERFACE/authorized**

---

Defined on file *sysfs-bus-usb*

This allows to authorize (1) or deauthorize (0) individual interfaces instead a whole device in contrast to the device authorization. If a deauthorized interface will be authorized so the driver probing must be triggered manually by writing INTERFACE to /sys/bus/usb/drivers\_probe This allows to avoid side-effects with drivers that need multiple interfaces.

A deauthorized interface cannot be probed or claimed.

---

**/sys/bus/usb/devices/usbX/interface\_authorized\_default**

---

Defined on file *sysfs-bus-usb*

This is used as value that determines if interfaces would be authorized by default. The value can be 1 or 0. It's by default 1.

---

**/sys/bus/usb/drivers/…/new\_id**

---

Defined on file *sysfs-bus-usb*

Writing a device ID to this file will attempt to dynamically add a new device ID to a USB device driver. This may allow the driver to support more hardware than was included in the driver's static device ID support table at compile time. The format for the device ID is: idVendor idProduct bInterfaceClass RefIdVendor RefIdProduct The vendor ID and device ID fields are required, the rest is optional. The *Ref\** tuple can be used to tell the driver to use the same *driver\_data* for the new device as it is used for the reference device. Upon successfully adding an ID, the driver will probe for the device and attempt to bind to it. For example:

---

```
# echo "8086 10f5" > /sys/bus/usb/drivers/foo/new_id
```

---

Here add a new device (0458:7045) using *driver\_data* from an already supported device (0458:704c):

```
# echo "0458 7045 0 0458 704c" > /sys/bus/usb/drivers/foo/new_id
```

Reading from this file will list all dynamically added device IDs in the same format, with one entry per line. For example:

```
# cat /sys/bus/usb/drivers/foo/new_id
8086 10f5
dead beef 06
f00d cafe
```

The list will be truncated at PAGE\_SIZE bytes due to sysfs restrictions.

### **/sys/bus/usb/drivers/…/remove\_id**

Defined on file *sysfs-bus-usb*

Writing a device ID to this file will remove an ID that was dynamically added via the new\_id sysfs entry. The format for the device ID is: idVendor idProduct. After successfully removing an ID, the driver will no longer support the device. This is useful to ensure auto probing won't match the driver to the device. For example:

```
# echo "046d c315" > /sys/bus/usb/drivers/foo/remove_id
```

Reading from this file will list the dynamically added device IDs, exactly like reading from the entry “/sys/bus/usb/drivers/…/new\_id”

### **/sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_\***

Defined on file *sysfs-wusb\_cbaf*

Various files for managing Cable Based Association of (wireless) USB devices.

The sequence of operations should be:

1. Device is plugged in.
2. The connection manager (CM) sees a device with CBA capability. (the wusb\_chid etc. files in /sys/devices/blah/OURDEVICE).
3. The CM writes the host name, supported band groups, and the CHID (host ID) into the wusb\_host\_name, wusb\_host\_band\_groups and wusb\_chid files. These get sent to the device and the CDID (if any) for this host is requested.
4. The CM can verify that the device's supported band groups (wusb\_device\_band\_groups) are compatible with the host.
5. The CM reads the wusb\_cdid file.
6. The CM looks it up its database.
  - If it has a matching CHID,CDID entry, the device has been authorized before and nothing further needs to be done.
  - If the CDID is zero (or the CM doesn't find a matching CDID in its database), the device is assumed to be not known. The CM may associate the host with device by: writing a randomly generated CDID to

wusb\_cdid and then a random CK to wusb\_ck (this uploads the new CC to the device).

CMD may choose to prompt the user before associating with a new device.

7. Device is unplugged.

### References:

#### [WUSB-AM]

Association Models Supplement to the Certified Wireless Universal Serial Bus Specification, version 1.0.

**/sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_cdid**

Defined on file *sysfs-wusb\_cbaf*

The device's CDID formatted as 16 space-separated hex octets.

**/sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_chid**

Defined on file *sysfs-wusb\_cbaf*

The CHID of the host formatted as 16 space-separated hex octets.

Writes fetches device's supported band groups and the the CDID for any existing association with this host.

**/sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_ck**

Defined on file *sysfs-wusb\_cbaf*

Write 16 space-separated random, hex octets to associate with the device.

**/sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_device\_band\_groups**

Defined on file *sysfs-wusb\_cbaf*

The band groups supported by the device, in the format defined in [WUSB-AM].

**/sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_host\_band\_groups**

Defined on file *sysfs-wusb\_cbaf*

The band groups supported by the host, in the format defined in [WUSB-AM].

**/sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_host\_name**

Defined on file *sysfs-wusb\_cbaf*

A friendly name for the host as a UTF-8 encoded string.

### /sys/bus/vmbus/devices/…/driver\_override

Defined on file [sysfs-bus-vmbus](#)

This file allows the driver for a device to be specified which will override standard static and dynamic ID matching. When specified, only a driver with a name matching the value written to driver\_override will have an opportunity to bind to the device. The override is specified by writing a string to the driver\_override file (echo uio\_hv\_generic > driver\_override) and may be cleared with an empty string (echo > driver\_override). This returns the device to standard matching rules binding. Writing to driver\_override does not automatically unbind the device from its current driver or make any attempt to automatically load the specified driver. If no driver with a matching name is currently loaded in the kernel, the device will not bind to any driver. This also allows devices to opt-out of driver binding using a driver\_override name such as “none”. Only a single driver may be specified in the override, there is no support for parsing delimiters.

### /sys/bus/w1/devices/…/alarms

Defined on file [sysfs-driver-w1\\_therm](#)

(RW) read or write TH and TL (Temperature High an Low) alarms. Values shall be space separated and in the device range (typical -55 degC to 125 degC), if not values will be trimmed to device min/max capabilities. Values are integer as they are stored in a 8bit register in the device. Lowest value is automatically put to TL. Once set, alarms could be search at master level, refer to /w1/w1-generic for detailed information

Users: any user space application which wants to communicate with w1\_therm device

### /sys/bus/w1/devices/…/conv\_time

Defined on file [sysfs-driver-w1\\_therm](#)

(RW) Get, set, or measure a temperature conversion time. The setting remains active until a resolution change. Then it is reset to default (datasheet) conversion time for a new resolution.

**read:**

Actual conversion time in milliseconds.

**write:**

- ‘0’ :  
Set the default conversion time from the datasheet.
- ‘1’ :  
Measure and set the conversion time. Make a single temperature

conversion, measure an actual value. Increase it by 20% for temperature range. A new conversion time can be obtained by reading this same attribute.

- **other positive value:**

Set the conversion time in milliseconds.

Users: An application using the w1\_term device

---

**/sys/bus/w1/devices/…/eeprom**

---

Defined on file *sysfs-driver-w1\_therm*

(WO) writing that file will either trigger a save of the device data to its embedded EEPROM, either restore data embedded in device EEPROM. Be aware that devices support limited EEPROM writing cycles (typical 50k)

- ‘save’ : save device RAM to EEPROM
- ‘restore’ : restore EEPROM data in device RAM

Users: any user space application which wants to communicate with w1\_term device

---

**/sys/bus/w1/devices/…/ext\_power**

---

Defined on file *sysfs-driver-w1\_therm*

(RO) return the power status by asking the device

- ‘0’ : device parasite powered
- ‘1’ : device externally powered
- ‘-xx’ : xx is kernel error when reading power status

Users: any user space application which wants to communicate with w1\_term device

---

**/sys/bus/w1/devices/…/features**

---

Defined on file *sysfs-driver-w1\_therm*

(RW) Control optional driver settings. Bit masks to read/write (bitwise OR):

- 1 Enable check for conversion success. If byte 6 of scratchpad memory is 0xC after conversion, and temperature reads 85.00 (powerup value) or 127.94 (insufficient power) - return a conversion error.
- 2 Enable poll for conversion completion. Generate read cycles after the conversion start and wait for 1' s. In parasite power mode this feature is not available.

**read:**

Currently selected features.

### **write:**

Select features.

Users: An application using the w1\_term device

### **/sys/bus/w1/devices/…/resolution**

Defined on file *sysfs-driver-w1\_therm*

(RW) get or set the device resolution (on supported devices, if not, this entry is not present). Note that the resolution will be changed only in device RAM, so it will be cleared when power is lost. Trigger a ‘save’ to EEPROM command to keep values after power-on. Read or write are :

- ‘9..14’ : device resolution in bit or resolution to set in bit
- ‘-xx’ : xx is kernel error when reading the resolution
- Anything else: do nothing

Some DS18B20 clones are fixed in 12-bit resolution, so the actual resolution is read back from the chip and verified. Error is reported if the results differ.

Users: any user space application which wants to communicate with w1\_term device

### **/sys/bus/w1/devices/…/temperature**

Defined on file *sysfs-driver-w1\_therm*

(RO) return the temperature in 1/1000 degC.

- If a bulk read has been triggered, it will directly return the temperature computed when the bulk read occurred, if available. If not yet available, nothing is returned (a debug kernel message is sent), you should retry later on.
- If no bulk read has been triggered, it will trigger a conversion and send the result. Note that the conversion duration depend on the resolution (if device support this feature). It takes 94ms in 9bits resolution, 750ms for 12bits.

Users: any user space application which wants to communicate with w1\_term device

### **/sys/bus/w1/devices/…/w1\_slave**

Defined on file *sysfs-driver-w1\_therm*

(RW) return the temperature in 1/1000 degC. *read*: return 2 lines with the hexa output data sent on the bus, return the CRC check and temperature in 1/1000 degC *write*:

- ‘0’ : save the 2 or 3 bytes to the device EEPROM (i.e. TH, TL and config register)
- ‘9..14’ : set the device resolution in RAM (if supported)

- Anything else: do nothing

refer to /w1/slaves/w1\_therm for detailed information.

Users: any user space application which wants to communicate with w1\_term device

### **/sys/bus/w1/devices/19-<id>/speed**

Defined on file *sysfs-driver-w1\_ds28e17*

When written, this file sets the I2C speed on the connected DS28E17 chip. When read, it reads the current setting from the DS28E17 chip.

Valid values: 100, 400, 900 [kBaud].

Default 100, can be set by w1\_ds28e17.speed= module parameter.

Users: w1\_ds28e17 driver

### **/sys/bus/w1/devices/19-<id>/stretch**

Defined on file *sysfs-driver-w1\_ds28e17*

When written, this file sets the multiplier used to calculate the busy timeout for I2C operations on the connected DS28E17 chip. When read, returns the current setting. Valid values: 1 to 9.

Default 1, can be set by w1\_ds28e17.stretch= module parameter.

Users: w1\_ds28e17 driver

### **/sys/bus/w1/devices/w1\_bus\_masterXX/therm\_bulk\_read**

Defined on file *sysfs-driver-w1\_therm*

(RW) trigger a bulk read conversion. read the status

***read:***

- ‘-1’ :  
conversion in progress on at least 1 sensor
- ‘1’ :  
conversion complete but at least one sensor value has not been read yet
- ‘0’ :  
no bulk operation. Reading temperature will trigger a conversion on each device

***write:***

‘trigger’ : trigger a bulk read on all supporting devices on the bus

Note that if a bulk read is sent but one sensor is not read immediately, the next access to temperature on this device will return the temperature measured at the time of issue of the bulk read command (not the current temperature).

Users: any user space application which wants to communicate with w1\_term device

### **/sys/bus/wmi/devices/44FADEB1-B204-40F2-8581-394BBDC1B651/firmware\_update\_request**

---

Defined on file *sysfs-platform-intel-wmi-sbl-fw-update*

Allow user space entities to trigger update of Slim Bootloader (SBL). This attribute normally has a value of 0 and userspace can signal SBL to update firmware, on next reboot, by writing a value of 1. There are two available states:

- 0 -> Skip firmware update while rebooting
- 1 -> Attempt firmware update on next reboot

## 5.2.20 Symbols under /sys/class

### **/sys/class/**

---

Defined on file *sysfs-class*

The /sys/class directory will consist of a group of subdirectories describing individual classes of devices in the kernel. The individual directories will consist of either subdirectories, or symlinks to other directories.

All programs that use this directory tree must be able to handle both subdirectories or symlinks in order to work properly.

Users:

udev <[linux-hotplug-devel@lists.sourceforge.net](mailto:linux-hotplug-devel@lists.sourceforge.net)>

### **/sys/class/ata\_..**

---

Defined on file *sysfs-ata*

Provide a place in sysfs for storing the ATA topology of the system. This allows retrieving various information about ATA objects.

Files under /sys/class/ata\_port

For each port, a directory ataX is created where X is the `ata_port_id` of the port. The device parent is the ata host device.

---

/sys/class/ata_device/devX[.Y].Z/spdn_cnt
/sys/class/ata_device/devX[.Y].Z/gscr
/sys/class/ata_device/devX[.Y].Z/ering
/sys/class/ata_device/devX[.Y].Z/id
/sys/class/ata_device/devX[.Y].Z/pio_mode
/sys/class/ata_device/devX[.Y].Z/xfer_mode
/sys/class/ata_device/devX[.Y].Z/dma_mode
/sys/class/ata_device/devX[.Y].Z/class

---

Defined on file [sysfs-ata](#)

**spdn\_cnt:** (RO) Number of times libata decided to lower the speed of link due to errors.

**gscr:** (RO) Cached result of the dump of PM GSCR register. Valid registers are:

0: SATA_PMP_GSCR_PROD_ID,	1: SATA_PMP_GSCR_REV,	2:
SATA_PMP_GSCR_PORT_INFO,	32: SATA_PMP_GSCR_ERROR,	33:
SATA_PMP_GSCR_ERROR_EN,	64: SATA_PMP_GSCR_FEAT,	96:
SATA_PMP_GSCR_FEAT_EN,	130: SATA_PMP_GSCR_SII_GPIO	

Only valid if the device is a PM.

**ering:** (RO) Formatted output of the error ring of the device.

**id:** (RO) Cached result of IDENTIFY command, as described in ATA8 7.16 and 7.17. Only valid if the device is not a PM.

**pio\_mode:** (RO) PIO transfer mode used by the device.  
Mostly used by PATA devices.

**xfer\_mode:** (RO) Current transfer mode. Mostly used by PATA devices.

**dma\_mode:** (RO) DMA transfer mode used by the device.  
Mostly used by PATA devices.

**class:** (RO) Device class. Can be “ata” for disk, “atapi” for packet device, “pmp” for PM, or “none” if no device was found behind the link.

---

/sys/class/ata_device/devX[.Y].Z/trim
---------------------------------------

---

Defined on file [sysfs-ata](#)

(RO) Shows the DSM TRIM mode currently used by the device. Valid values are:

unsupported: Drive does not support DSM TRIM

unqueued: Drive supports unqueued DSM TRIM only

queued: Drive supports queued DSM TRIM

**forced\_unqueued:** Drive’s queued DSM support is known to be buggy and only unqueued TRIM commands are sent

```
/sys/class/ata_link/linkX[.Y]/hw_sata_spd_limit  
/sys/class/ata_link/linkX[.Y]/sata_spd_limit  
/sys/class/ata_link/linkX[.Y]/sata_spd
```

Defined on file [sysfs-ata](#)

**hw\_sata\_spd\_limit: (RO) Maximum speed supported by the connected SATA device.**

sata\_spd\_limit: (RO) Maximum speed imposed by libata.

**sata\_spd: (RO) Current speed of the link**  
eg. 1.5, 3 Gbps etc.

Files under /sys/class/ata\_device

Behind each link, up to two ata devices are created. The name of the directory is devX[.Y].Z where: - X is ata\_port\_id of the port where the device is connected, - Y the port of the PM if any, and - Z the device id: for PATA, there is usually 2 devices [0,1], only 1 for SATA.

```
/sys/class/ata_port/ataX/nr_pmp_links  
/sys/class/ata_port/ataX/idle_irq
```

Defined on file [sysfs-ata](#)

**nr\_pmp\_links: (RO) If a SATA Port Multiplier (PM) is connected, the number of links behind it.**

**idle\_irq: (RO) Number of IRQ received by the port while idle [some ata HBA only].**

```
/sys/class/ata_port/ataX/port_no
```

Defined on file [sysfs-ata](#)

(RO) Host local port number. While registering host controller, port numbers are tracked based upon number of ports available on the controller. This attribute is needed by udev for composing persistent links in /dev/disk/by-path.

Files under /sys/class/ata\_link

Behind each port, there is a ata\_link. If there is a SATA PM in the topology, 15 ata\_link objects are created.

If a link is behind a port, the directory name is linkX, where X is ata\_port\_id of the port. If a link is behind a PM, its name is linkX.Y where X is ata\_port\_id of the parent port and Y the PM port.

---

/sys/class/backlight/<backlight>/<ambient light zone>_dim
/sys/class/backlight/<backlight>/l2_bright_dim
/sys/class/backlight/<backlight>/l3_office_dim
/sys/class/backlight/<backlight>/l4_indoor_dim
/sys/class/backlight/<backlight>/l5_dark_dim

---

Defined on file [sysfs-class-backlight-driver-adp8870](#)

Control the dim brightness for <ambient light zone> on this <backlight>. Values are between 0 and 127, typically set to 0. Full off when the backlight is disabled. This file will also show the dim brightness level stored for this <ambient light zone>.

---

/sys/class/backlight/<backlight>/<ambient light zone>_max
/sys/class/backlight/<backlight>/l1_daylight_max
/sys/class/backlight/<backlight>/l2_bright_max
/sys/class/backlight/<backlight>/l3_office_max
/sys/class/backlight/<backlight>/l4_indoor_max
/sys/class/backlight/<backlight>/l5_dark_max

---

Defined on file [sysfs-class-backlight-driver-adp8870](#)

Control the maximum brightness for <ambient light zone> on this <backlight>. Values are between 0 and 127. This file will also show the brightness level stored for this <ambient light zone>.

---

/sys/class/backlight/<backlight>/als_channel
--

---

Defined on file [sysfs-class-backlight-driver-lm3533](#)

Get the ALS output channel used as input in ALS-current-control mode (0, 1), where:

---

0 out_current0 (backlight 0)
1 out_current1 (backlight 1)

---

---

/sys/class/backlight/<backlight>/als_en
---

---

Defined on file [sysfs-class-backlight-driver-lm3533](#)

Enable ALS-current-control mode (0, 1).

---

/sys/class/backlight/<backlight>/ambient_light_level
--

---

Defined on file [sysfs-class-backlight](#)

(RO) Get conversion value of the light sensor.

The value is automatically updated every 80 ms when the light sensor is enabled.

The value range is device-driver specific:

For ADP8870:

It returns integer between 0 (dark) and 8000 (max ambient brightness).

For ADP8860:

It returns a 13-bits integer.

---

### /sys/class/backlight/<backlight>/ambient\_light\_zone

---

Defined on file *sysfs-class-backlight*

(RW) Read or write the specific brightness level at which the backlight operates.

The value meaning is device-driver specific:

For ADP8860:

0	Off: Backlight set to 0 mA
1	Level 1: daylight
2	Level 2: bright
3	Level 3: dark

---

For ADP8870:

0	Off: Backlight set to 0 mA
1	Level 1: daylight
2	Level 2: bright
3	Level 3: office
4	Level 4: indoor
5	Level 5: dark

---

Writing 0 returns to normal/automatic ambient light level operation.

It can be enabled by writing the value stored in /sys/class/backlight/<backlight>/max\_brightness to /sys/class/backlight/<backlight>/brightness.

---

### /sys/class/backlight/<backlight>/bled\_mode

---

Defined on file *sysfs-class-backlight-lm3639*

(WO) Write to the backlight mapping mode. The backlight current can be mapped for either exponential (value “0”) or linear mapping modes (default).

/sys/class/backlight/<backlight>/daylight_dim
/sys/class/backlight/<backlight>/office_dim
/sys/class/backlight/<backlight>/dark_dim

---

Defined on file [sysfs-class-backlight-adp5520](#)

(RW) Dim current setting for the backlight when brightness is at one of the three levels (daylight, office or dark). This is an input code between 0 and 127, which is transformed to a value between 0 mA and 30 mA using linear or non-linear algorithms.

---

```
/sys/class/backlight/<backlight>/daylight_max  
/sys/class/backlight/<backlight>/office_max  
/sys/class/backlight/<backlight>/dark_max
```

---

Defined on file [sysfs-class-backlight-adp5520](#)

(RW) Maximum current setting for the backlight when brightness is at one of the three levels (daylight, office or dark). This is an input code between 0 and 127, which is transformed to a value between 0 mA and 30 mA using linear or non-linear algorithms.

---

```
/sys/class/backlight/<backlight>/id
```

---

Defined on file [sysfs-class-backlight-driver-lm3533](#)

Get the id of this backlight (0, 1).

---

```
/sys/class/backlight/<backlight>/l1_daylight_dim  
/sys/class/backlight/<backlight>/l2_office_dim  
/sys/class/backlight/<backlight>/l3_dark_dim
```

---

Defined on file [sysfs-class-backlight-adp8860](#)

(RW) Dim current setting for the backlight when brightness is at one of the three levels (daylight, office or dark). This is an input code between 0 and 127, which is transformed to a value between 0 mA and 30 mA using linear or non-linear algorithms.

---

```
/sys/class/backlight/<backlight>/l1_daylight_max  
/sys/class/backlight/<backlight>/l2_office_max  
/sys/class/backlight/<backlight>/l3_dark_max
```

---

Defined on file [sysfs-class-backlight-adp8860](#)

(RW) Maximum current setting for the backlight when brightness is at one of the three levels (daylight, office or dark). This is an input code between 0 and 127, which is transformed to a value between 0 mA and 30 mA using linear or non-linear algorithms.

---

```
/sys/class/backlight/<backlight>/linear
```

---

Defined on file [sysfs-class-backlight-driver-lm3533](#)

Set the brightness-mapping mode (0, 1), where:

0	exponential mode
1	linear mode

---

### **/sys/class/backlight/<backlight>/pwm**

---

Defined on file [sysfs-class-backlight-driver-lm3533](#)

Set the PWM-input control mask (5 bits), where:

bit 5	PWM-input enabled in Zone 4
bit 4	PWM-input enabled in Zone 3
bit 3	PWM-input enabled in Zone 2
bit 2	PWM-input enabled in Zone 1
bit 1	PWM-input enabled in Zone 0
bit 0	PWM-input enabled

---

### **/sys/class/backlight/<backlight>/scale**

---

Defined on file [sysfs-class-backlight](#)

Description of the scale of the brightness curve.

The human eye senses brightness approximately logarithmically, hence linear changes in brightness are perceived as being non-linear. To achieve a linear perception of brightness changes controls like sliders need to apply a logarithmic mapping for backlights with a linear brightness curve.

Possible values of the attribute are:

#### **unknown**

The scale of the brightness curve is unknown.

#### **linear**

The brightness changes linearly with each step. Brightness controls should apply a logarithmic mapping for a linear perception.

#### **non-linear**

The brightness changes non-linearly with each step. Brightness controls should use a linear mapping for a linear perception.

---

### **/sys/class/bdi/<bdi>/**

---

Defined on file [sysfs-class-bdi](#)

Provide a place in sysfs for the backing\_dev\_info object. This allows setting and retrieving various BDI specific variables.

The <bdi> identifier can be either of the following:

## MAJOR:MINOR

Device number for block devices, or value of `st_dev` on non-block filesystems which provide their own BDI, such as NFS and FUSE.

## MAJOR:MINOR-fuseblk

Value of `st_dev` on `fuseblk` filesystems.

### default

The default backing dev, used for non-block device backed filesystems which do not provide their own BDI.

#### Files under `/sys/class/bdi/<bdi>/`

##### `read_ahead_kb` (read-write)

Size of the read-ahead window in kilobytes

##### `min_ratio` (read-write)

Under normal circumstances each device is given a part of the total write-back cache that relates to its current average writeout speed in relation to the other devices.

The ‘`min_ratio`’ parameter allows assigning a minimum percentage of the write-back cache to a particular device. For example, this is useful for providing a minimum QoS.

##### `max_ratio` (read-write)

Allows limiting a particular device to use not more than the given percentage of the write-back cache. This is useful in situations where we want to avoid one device taking all or most of the write-back cache. For example in case of an NFS mount that is prone to get stuck, or a FUSE mount which cannot be trusted to play fair.

##### `stable_pages_required` (read-only)

If set, the backing device requires that all pages comprising a write request must not be changed until writeout is complete.

## `/sys/class/bsr/bsr*/bsr_length`

Defined on file `sysfs-class-bsr`

(RO) The length of memory region that can be mapped in bytes.

## `/sys/class/bsr/bsr*/bsr_size`

Defined on file `sysfs-class-bsr`

(RO) Size of the barrier-synchronization register (BSR) register in bytes.

## `/sys/class/bsr/bsr*/bsr_stride`

Defined on file *sysfs-class-bsr*

(RO) The stride or the interval at which the allocated BSR bytes repeat within the mapping.

### **/sys/class/c2port/**

Defined on file *sysfs-c2port*

The */sys/class/c2port/* directory will contain files and directories that will provide a unified interface to the C2 port interface.

### **/sys/class/c2port/c2portX**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/* directory is related to X-th C2 port into the system. Each directory will contain files to manage and control its C2 port.

### **/sys/class/c2port/c2portX/access**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/access* file enable the access to the C2 port from the system. No commands can be sent till this entry is set to 0.

### **/sys/class/c2port/c2portX/dev\_id**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/dev\_id* file show the device ID of the connected micro.

### **/sys/class/c2port/c2portX/flash\_access**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/flash\_access* file enable the access to the on-board flash of the connected micro. No commands can be sent till this entry is set to 0.

### **/sys/class/c2port/c2portX/flash\_block\_size**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/flash\_block\_size* file show the on-board flash block size of the connected micro.

### **/sys/class/c2port/c2portX/flash\_blocks\_num**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/flash\_blocks\_num* file show the on-board flash blocks number of the connected micro.

### **/sys/class/c2port/c2portX/flash\_data**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/flash\_data* file export the content of the on-board flash of the connected micro.

### **/sys/class/c2port/c2portX/flash\_erase**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/flash\_erase* file execute the “erase” command on the on-board flash of the connected micro.

### **/sys/class/c2port/c2portX/reset**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/reset* file execute a “reset” command on the connected micro.

### **/sys/class/c2port/c2portX/rev\_id**

Defined on file *sysfs-c2port*

The */sys/class/c2port/c2portX/rev\_id* file show the revision ID of the connected micro.

### **/sys/class/chromeos/<ec-device-name>/flashinfo**

Defined on file *sysfs-class-chromeos*

Show the EC flash information.

### **/sys/class/chromeos/<ec-device-name>/kb\_wake\_angle**

Defined on file *sysfs-class-chromeos*

Control the keyboard wake lid angle. Values are between 0 and 360. This file will also show the keyboard wake lid angle by querying the hardware.

### **/sys/class/chromeos/<ec-device-name>/lightbar/brightness**

Defined on file *sysfs-class-chromeos-driver-cros-ec-lightbar*

Writing to this file adjusts the overall brightness of the lightbar, separate from any color intensity. The valid range is 0 (off) to 255 (maximum brightness).

### **/sys/class/chromeos/<ec-device-name>/lightbar/interval\_msec**

Defined on file *sysfs-class-chromeos-driver-cros-ec-lightbar*

The lightbar is controlled by an embedded controller (EC), which also manages the keyboard, battery charging, fans, and other system hardware. To prevent unprivileged users from interfering with the other EC functions, the rate at which the lightbar control files can be read or written is limited.

Reading this file will return the number of milliseconds that must elapse between accessing any of the lightbar functions through this interface. Going faster will simply block until the necessary interval has lapsed. The interval applies uniformly to all accesses of any kind by any user.

### **/sys/class/chromeos/<ec-device-name>/lightbar/led\_rgb**

Defined on file *sysfs-class-chromeos-driver-cros-ec-lightbar*

This allows you to control each LED segment. If the lightbar is already running one of the automatic sequences, you probably won't see anything change because your color setting will be almost immediately replaced. To get useful results, you should stop the lightbar sequence first.

The values written to this file are sets of four integers, indicating LED, RED, GREEN, BLUE. The LED number is 0 to 3 to select a single segment, or 4 to set all four segments to the same value at once. The RED, GREEN, and BLUE numbers should be in the range 0 (off) to 255 (maximum). You can update more than one segment at a time by writing more than one set of four integers.

### **/sys/class/chromeos/<ec-device-name>/lightbar/program**

Defined on file *sysfs-class-chromeos-driver-cros-ec-lightbar*

This allows you to upload and run custom lightbar sequences.

### **/sys/class/chromeos/<ec-device-name>/lightbar/sequence**

Defined on file *sysfs-class-chromeos-driver-cros-ec-lightbar*

The Pixel lightbar has a number of built-in sequences that it displays under various conditions, such as at power on, shut down, or while running. Reading from this file displays the current sequence that the lightbar is displaying. Writing to this file allows you to change the sequence.

### **/sys/class/chromeos/<ec-device-name>/lightbar/userspace\_control**

Defined on file *sysfs-class-chromeos-driver-cros-ec-lightbar*

This allows you to take the control of the lightbar. This prevents the kernel from going through its normal sequences.

---

**/sys/class/chromeos/<ec-device-name>/lightbar/version**

---

Defined on file *sysfs-class-chromeos-driver-cros-ec-lightbar*

Show the information about the lightbar version.

---

**/sys/class/chromeos/<ec-device-name>/reboot**

---

Defined on file *sysfs-class-chromeos*

Tell the EC to reboot in various ways. Options are:

- “cancel” : Cancel a pending reboot.
- “ro” : Jump to RO without rebooting.
- “rw” : Jump to RW without rebooting.
- “cold” : Cold reboot.
- “disable-jump” : Disable jump until next reboot.
- “hibernate” : Hibernate the EC.
- “at-shutdown” : Reboot after an AP shutdown.

---

**/sys/class/chromeos/<ec-device-name>/vbc/vboot\_context**

---

Defined on file *sysfs-class-chromeos-driver-cros-ec-vbc*

Read/write the verified boot context data included on a small nvram space on some EC implementations.

---

**/sys/class/chromeos/<ec-device-name>/version**

---

Defined on file *sysfs-class-chromeos*

Show the information about the EC software and hardware.

---

**/sys/class/cxl/<afu>/afu\_err\_buf**

---

Defined on file *sysfs-class-cxl*

read only AFU Error Buffer contents. The contents of this file are application specific and depends on the AFU being used. Applications interacting with the AFU can use this attribute to know about the current error condition and take appropriate action like logging the event etc.

---

**/sys/class/cxl/<afu>/api\_version**

---

Defined on file *sysfs-class-cxl*

read only Decimal value of the current version of the kernel/user API.

Users: <https://github.com/ibm-capi/libcxl>

---

### **/sys/class/cxl/<afu>/api\_version\_compatible**

---

Defined on file *sysfs-class-cxl*

read only Decimal value of the the lowest version of the userspace API this this kernel supports.

Users: <https://github.com/ibm-capi/libcxl> AFU configuration records (eg. /sys/class/cxl/afu0.0/cr0): An AFU may optionally export one or more PCIe like configuration records, known as AFU configuration records, which will show up here (if present).

---

### **/sys/class/cxl/<afu>/cr<config num>/class**

---

Defined on file *sysfs-class-cxl*

read only Hexadecimal value of the class code found in this AFU configuration record.

Users: <https://github.com/ibm-capi/libcxl>

---

### **/sys/class/cxl/<afu>/cr<config num>/config**

---

Defined on file *sysfs-class-cxl*

read only This binary file provides raw access to the AFU configuration record. The format is expected to match the either the standard or extended configuration space defined by the PCIe specification.

Users: <https://github.com/ibm-capi/libcxl> Master contexts (eg. /sys/class/cxl/afu0.0m)

---

### **/sys/class/cxl/<afu>/cr<config num>/device**

---

Defined on file *sysfs-class-cxl*

read only Hexadecimal value of the device ID found in this AFU configuration record.

Users: <https://github.com/ibm-capi/libcxl>

---

### **/sys/class/cxl/<afu>/cr<config num>/vendor**

---

Defined on file *sysfs-class-cxl*

read only Hexadecimal value of the vendor ID found in this AFU configuration record.

Users: <https://github.com/ibm-capi/libcxl>

---

**/sys/class/cxl/<afu>/irqs\_max**

Defined on file *sysfs-class-cxl*

read/write Decimal value of maximum number of interrupts that can be requested by userspace. The default on probe is the maximum that hardware can support (eg. 2037). Write values will limit userspace applications to that many userspace interrupts. Must be  $\geq$  irqs\_min.

Users: <https://github.com/ibm-capi/libcxl>

---

**/sys/class/cxl/<afu>/irqs\_min**

Defined on file *sysfs-class-cxl*

read only Decimal value of the minimum number of interrupts that userspace must request on a CXL\_START\_WORK ioctl. Userspace may omit the num\_interrupts field in the START\_WORK IOCTL to get this minimum automatically.

Users: <https://github.com/ibm-capi/libcxl>

---

**/sys/class/cxl/<afu>/mmio\_size**

Defined on file *sysfs-class-cxl*

read only Decimal value of the size of the MMIO space that may be mmapped by userspace.

Users: <https://github.com/ibm-capi/libcxl>

---

**/sys/class/cxl/<afu>/mode**

Defined on file *sysfs-class-cxl*

read/write The current mode the AFU is using. Will be one of the modes given in modes\_supported. Writing will change the mode provided that no user contexts are attached.

Users: <https://github.com/ibm-capi/libcxl>

---

**/sys/class/cxl/<afu>/modes\_supported**

Defined on file *sysfs-class-cxl*

read only List of the modes this AFU supports. One per line. Valid entries are: “dedicated\_process” and “afu\_directed”

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/cxl/<afu>/prefault\_mode**

Defined on file *sysfs-class-cxl*

read/write Set the mode for prefaulting in segments into the segment table when performing the START\_WORK ioctl. Only applicable when running under hashed page table mmu. Possible values:

none	No prefaulting (default)
work_element_des	Treat the work element descriptor as an effective address and prefault what it points to.
all	all segments process calling START_WORK maps.

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/cxl/<afu>/reset**

Defined on file *sysfs-class-cxl*

write only Writing 1 here will reset the AFU provided there are not contexts active on the AFU.

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/cxl/<afu>m/mmio\_size**

Defined on file *sysfs-class-cxl*

read only Decimal value of the size of the MMIO space that may be mmapped by userspace. This includes all slave contexts space also.

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/cxl/<afu>m/pp\_mmio\_len**

Defined on file *sysfs-class-cxl*

read only Decimal value of the Per Process MMIO space length.

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/cxl/<afu>m/pp\_mmio\_off (not in a guest)**

Defined on file *sysfs-class-cxl*

read only Decimal value of the Per Process MMIO space offset.

Users: <https://github.com/ibm-capi/libcxl> Card info (eg. /sys/class/cxl/card0)

**/sys/class/cxl/<card>/base\_image (not in a guest)**

Defined on file *sysfs-class-cxl*

read only Identifies the revision level of the base image for devices that support loadable PSLs. For FPGAs this field identifies the image contained in the on-adapter flash which is loaded during the initial program load.

Users: <https://github.com/ibm-capi/libcxl>

**/sys/class/cxl/<card>/caia\_version**

Defined on file *sysfs-class-cxl*

read only Identifies the CAIA Version the card implements.

Users: <https://github.com/ibm-capi/libcxl>

**/sys/class/cxl/<card>/image\_loaded (not in a guest)**

Defined on file *sysfs-class-cxl*

read only Will return “user” or “factory” depending on the image loaded onto the card.

Users: <https://github.com/ibm-capi/libcxl>

**/sys/class/cxl/<card>/load\_image\_on\_perst (not in a guest)**

Defined on file *sysfs-class-cxl*

read/write Valid entries are “none” , “user” , and “factory” . “none” means PERST will not cause image to be loaded to the card. A power cycle is required to load the image. “none” could be useful for debugging because the trace arrays are preserved.

“user” and “factory” means PERST will cause either the user or user or factory image to be loaded. Default is to reload on PERST whichever image the card has loaded.

Users: <https://github.com/ibm-capi/libcxl>

**/sys/class/cxl/<card>/perst\_reloads\_same\_image (not in a guest)**

Defined on file *sysfs-class-cxl*

read/write Trust that when an image is reloaded via PERST, it will not have changed.

0	don't trust, the image may be different (default)
1	trust that the image will not change.

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/cxl/<card>/psl\_revision**

Defined on file *sysfs-class-cxl*

read only Identifies the revision level of the PSL.

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/cxl/<card>/psl\_timebase\_synced**

Defined on file *sysfs-class-cxl*

read only Returns 1 if the psl timebase register is synchronized with the core timebase register, 0 otherwise.

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/cxl/<card>/reset**

Defined on file *sysfs-class-cxl*

write only Writing 1 will issue a PERST to card provided there are no contexts active on any one of the card AFUs. This may cause the card to reload the FPGA depending on `load_image_on_perst`. Writing -1 will do a force PERST irrespective of any active contexts on the card AFUs.

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/cxl/<card>/tunneled\_ops\_supported**

Defined on file *sysfs-class-cxl*

read only Returns 1 if tunneled operations are supported in capi mode, 0 otherwise.

Users: <https://github.com/ibm-capi/libcxl>

### **/sys/class/devfreq-event/event(x)/**

Defined on file *sysfs-class-devfreq-event*

Provide a place in sysfs for the devfreq-event objects. This allows accessing various devfreq-event specific variables. The name of devfreq-event object denoted as ‘event(x)’ which includes the unique number of ‘x’ for each devfreq-event object.

### **/sys/class/devfreq-event/event(x)/enable\_count**

Defined on file *sysfs-class-devfreq-event*

The `/sys/class/devfreq-event/event(x)/enable_count` attribute contains the reference count to enable the devfreq-event object. If the device is enabled, the value of attribute is greater than zero.

---

### **/sys/class/devfreq-event/event(x)/name**

---

Defined on file *sysfs-class-devfreq-event*

The `/sys/class/devfreq-event/event(x)/name` attribute contains the name of the devfreq-event object. This attribute is read-only.

---

### **/sys/class/devfreq/…/**

---

Defined on file *sysfs-class-devfreq*

Provide a place in sysfs for the devfreq objects. This allows accessing various devfreq specific variables. The name of devfreq object denoted as `…` is same as the name of device using devfreq.

---

### **/sys/class/devfreq/…/available\_frequencies**

---

Defined on file *sysfs-class-devfreq*

The `/sys/class/devfreq/…/available_frequencies` shows the available frequencies of the corresponding devfreq object. This is a snapshot of available frequencies and not limited by the min/max frequency restrictions.

---

### **/sys/class/devfreq/…/available\_governors**

---

Defined on file *sysfs-class-devfreq*

The `/sys/class/devfreq/…/available_governors` shows currently available governors in the system.

---

### **/sys/class/devfreq/…/cur\_freq**

---

Defined on file *sysfs-class-devfreq*

The `/sys/class/devfreq/…/cur_freq` shows the current frequency of the corresponding devfreq object. Same as `target_freq` when `get_cur_freq()` is not implemented by devfreq driver.

---

### **/sys/class/devfreq/…/governor**

---

Defined on file *sysfs-class-devfreq*

The `/sys/class/devfreq/…/governor` show or set the name of the governor used by the corresponding devfreq object.

### **/sys/class/devfreq/…/max\_freq**

Defined on file *sysfs-class-devfreq*

The /sys/class/devfreq/…/max\_freq shows and stores the maximum frequency requested by users. It is 0 if the user does not care. max\_freq overrides the frequency requested by governors and min\_freq. The max\_freq overrides min\_freq because max\_freq may be used to throttle devices to avoid overheating.

### **/sys/class/devfreq/…/min\_freq**

Defined on file *sysfs-class-devfreq*

The /sys/class/devfreq/…/min\_freq shows and stores the minimum frequency requested by users. It is 0 if the user does not care. min\_freq overrides the frequency requested by governors.

### **/sys/class/devfreq/…/name**

Defined on file *sysfs-class-devfreq*

The /sys/class/devfreq/…/name shows the name of device of the corresponding devfreq object.

### **/sys/class/devfreq/…/polling\_interval**

Defined on file *sysfs-class-devfreq*

The /sys/class/devfreq/…/polling\_interval shows and sets the requested polling interval of the corresponding devfreq object. The values are represented in ms. If the value is less than 1 jiffy, it is considered to be 0, which means no polling. This value is meaningless if the governor is not polling; thus. If the governor is not using devfreq-provided central polling (/sys/class/devfreq/…/central\_polling is 0), this value may be useless.

### **/sys/class/devfreq/…/target\_freq**

Defined on file *sysfs-class-devfreq*

The /sys/class/devfreq/…/target\_freq shows the next governor predicted target frequency of the corresponding devfreq object.

### **/sys/class/devfreq/…/timer**

Defined on file *sysfs-class-devfreq*

This ABI shows and stores the kind of work timer by users. This work timer is used by devfreq workqueue in order to monitor the device status such as utilization. The user can change the work timer on runtime according to their demand as following:

```
echo deferrable > /sys/class/devfreq/.../timer
echo delayed > /sys/class/devfreq/.../timer
```

### **/sys/class/devfreq/…/trans\_stat**

Defined on file *sysfs-class-devfreq*

This ABI shows or clears the statistics of devfreq behavior on a specific device. It shows the time spent in each state and the number of transitions between states. In order to activate this ABI, the devfreq target device driver should provide the list of available frequencies with its profile. If need to reset the statistics of devfreq behavior on a specific device, enter 0(zero) to ‘trans\_stat’ as following:

```
echo 0 > /sys/class/devfreq/.../trans_stat
```

If the transition table is bigger than PAGE\_SIZE, reading this will return an -EFBIG error.

### **/sys/class/devfreq/…/userspace/set\_freq**

Defined on file *sysfs-class-devfreq*

The /sys/class/devfreq/…/userspace/set\_freq shows and sets the requested frequency for the devfreq object if userspace governor is in effect.

### **/sys/class/devlink/…/**

Defined on file *sysfs-class-devlink*

Provide a place in sysfs for the device link objects in the kernel at any given time. The name of a device link directory, denoted as …above, is of the form <supplier>-<consumer> where <supplier> is the supplier bus:device name and <consumer> is the consumer bus:device name.

### **/sys/class/devlink/…/auto\_remove\_on**

Defined on file *sysfs-class-devlink*

This file indicates if the device link will ever be automatically removed by the driver core when the consumer and supplier devices themselves are still present.

This will be one of the following strings:

- ‘consumer unbind’
- ‘supplier unbind’
- ‘never’

‘consumer unbind’ means the device link will be removed when the consumer’s driver is unbound from the consumer device.

‘supplier unbind’ means the device link will be removed when the supplier’ s driver is unbound from the supplier device.

‘never’ means the device link will not be automatically removed when as long as the supplier and consumer devices themselves are still present.

### /sys/class/devlink/…/consumer

Defined on file *sysfs-class-devlink*

This file is a symlink to the consumer device’ s sysfs directory.

### /sys/class/devlink/…/runtime\_pm

Defined on file *sysfs-class-devlink*

This file indicates if the device link has any impact on the runtime power management behavior of the consumer and supplier devices. For example: Making sure the supplier doesn’ t enter runtime suspend while the consumer is active.

This will be one of the following strings:

‘0’	Does not affect runtime power management
‘1’	Affects runtime power management

### /sys/class/devlink/…/status

Defined on file *sysfs-class-devlink*

This file indicates the status of the device link. The status of a device link is affected by whether the supplier and consumer devices have been bound to their corresponding drivers. The status of a device link also affects the binding and unbinding of the supplier and consumer devices with their drivers and also affects whether the software state of the supplier device is synced with the hardware state of the supplier device after boot up. See also: *sysfs-devices-state\_synced*.

This will be one of the following strings:

- ‘not tracked’
- ‘dormant’
- ‘available’
- ‘consumer probing’
- ‘active’
- ‘supplier unbinding’
- ‘unknown’

‘not tracked’ means this device link does not track the status and has no impact on the binding, unbinding and syncing the hardware and software device state.

‘dormant’ means the supplier and the consumer devices have not bound to their driver.

‘available’ means the supplier has bound to its driver and is available to supply resources to the consumer device.

‘consumer probing’ means the consumer device is currently trying to bind to its driver.

‘active’ means the supplier and consumer devices have both bound successfully to their drivers.

‘supplier unbinding’ means the supplier devices is currently in the process of unbinding from its driver.

‘unknown’ means the state of the device link is not any of the above. If this is ever the value, there’s a bug in the kernel.

---

**/sys/class/devlink/…/supplier**

Defined on file *sysfs-class-devlink*

This file is a symlink to the supplier device’s sysfs directory.

---

**/sys/class/devlink/…/sync\_state\_only**

Defined on file *sysfs-class-devlink*

This file indicates if the device link is limited to only affecting the syncing of the hardware and software state of the supplier device.

This will be one of the following strings:

---

‘0’
‘1’ Affects runtime power management

---

‘0’ means the device link can affect other device behaviors like binding/unbinding, suspend/resume, runtime power management, etc.

‘1’ means the device link will only affect the syncing of hardware and software state of the supplier device after boot up and doesn’t not affect other behaviors of the devices.

---

**/sys/class/extcon/…/**

Defined on file *sysfs-class-extcon*

Provide a place in sysfs for the extcon objects. This allows accessing extcon specific variables. The name of extcon object denoted as … is the name given with extcon\_dev\_register.

One extcon device denotes a single external connector port. An external connector may have multiple cables attached simultaneously. Many of docks, cradles, and

accessory cables have such capability. For example, the 30-pin port of Nuri board (/arch/arm/mach-exynos) may have both HDMI and Charger attached, or analog audio, video, and USB cables attached simultaneously.

If there are cables mutually exclusive with each other, such binary relations may be expressed with extcon\_dev's mutually\_exclusive array.

### /sys/class/extcon/…/cable.x/name

Defined on file *sysfs-class-extcon*

The /sys/class/extcon/…/cable.x/name shows the name of cable “x” (integer between 0 and 31) of an extcon device.

### /sys/class/extcon/…/cable.x/state

Defined on file *sysfs-class-extcon*

The /sys/class/extcon/…/cable.x/state shows and stores the state of cable “x” (integer between 0 and 31) of an extcon device. The state value is either 0 (detached) or 1 (attached).

### /sys/class/extcon/…/mutually\_exclusive/..

Defined on file *sysfs-class-extcon*

Shows the relations of mutually exclusiveness. For example, if the mutually\_exclusive array of extcon device is {0x3, 0x5, 0xC, 0x0}, then the output is:

```
# ls mutually_exclusive/
0x3
0x5
0xc
#
```

Note that mutually\_exclusive is a sub-directory of the extcon device and the file names under the mutually\_exclusive directory show the mutually-exclusive sets, not the contents of the files.

### /sys/class/extcon/…/name

Defined on file *sysfs-class-extcon*

The /sys/class/extcon/…/name shows the name of the extcon object. If the extcon object has an optional callback “show\_name” defined, the callback will provide the name with this sysfs node.

### /sys/class/extcon/…/state

Defined on file *sysfs-class-extcon*

The `/sys/class/extcon/…/state` shows and stores the cable attach/detach information of the corresponding extcon object. If the extcon object has an optional callback “`show_state`” defined, the showing function is overridden with the optional callback.

If the default callback for showing function is used, the format is like this:

```
# cat state
USB_OTG=1
HDMI=0
TA=1
EAR_JACK=0
#
```

In this example, the extcon device has USB\_OTG and TA cables attached and HDMI and EAR\_JACK cables detached.

In order to update the state of an extcon device, enter a hex state number starting with 0x:

```
# echo 0xHEX > state
```

This updates the whole state of the extcon device. Inputs of all the methods are required to meet the mutually\_exclusive conditions if they exist.

It is recommended to use this “global” state interface if you need to set the value atomically. The later state interface associated with each cable cannot update multiple cable states of an extcon device simultaneously.

### **/sys/class/fpga\_bridge/<bridge>/name**

Defined on file *sysfs-class-fpga-bridge*

Name of low level FPGA bridge driver.

### **/sys/class/fpga\_bridge/<bridge>/state**

Defined on file *sysfs-class-fpga-bridge*

Show bridge state as “enabled” or “disabled”

### **/sys/class/fpga\_manager/<fpga>/name**

Defined on file *sysfs-class-fpga-manager*

Name of low level fpga manager driver.

### **/sys/class/fpga\_manager/<fpga>/state**

Defined on file *sysfs-class-fpga-manager*

Read fpga manager state as a string. The intent is to provide enough detail that if something goes wrong during FPGA programming (something that the driver can't fix) then userspace can know, i.e. if the firmware request fails, that could be due to not being able to find the firmware file.

This is a superset of FPGA states and fpga manager driver states. The fpga manager driver is walking through these steps to get the FPGA into a known operating state. It's a sequence, though some steps may get skipped. Valid FPGA states will vary by manufacturer; this is a superset.

- unknown = can't determine state
- power off = FPGA power is off
- power up = FPGA reports power is up
- reset = FPGA held in reset state
- firmware request = firmware class request in progress
- firmware request error = firmware request failed
- write init = preparing FPGA for programming
- write init error = Error while preparing FPGA for programming
- write = FPGA ready to receive image data
- write error = Error while programming
- write complete = Doing post programming steps
- write complete error = Error while doing post programming
- operating = FPGA is programmed and operating

---

### `/sys/class/fpga_manager/<fpga>/status`

---

Defined on file [sysfs-class-fpga-manager](#)

Read fpga manager status as a string. If FPGA programming operation fails, it could be caused by crc error or incompatible bitstream image. The intent of this interface is to provide more detailed information for FPGA programming errors to userspace. This is a list of strings for the supported status.

- **reconfig operation error - invalid operations detected by**  
reconfiguration hardware. e.g. start reconfiguration with errors not cleared
- **reconfig CRC error - CRC error detected by**  
reconfiguration hardware.
- **reconfig incompatible image - reconfiguration image is**  
incompatible with hardware
- **reconfig IP protocol error - protocol errors detected by**  
reconfiguration hardware
- **reconfig fifo overflow error - FIFO overflow detected by**  
reconfiguration hardware

**/sys/class/fpga\_region/<region>/compat\_id**

Defined on file *sysfs-class-fpga-region*

FPGA region id for compatibility check, e.g. compatibility of the FPGA reconfiguration hardware and image. This value is defined or calculated by the layer that is creating the FPGA region. This interface returns the compat\_id value or just error code -ENOENT in case compat\_id is not used.

**/sys/class/genwqe/genwqe<n>\_card/appid**

Defined on file *sysfs-driver-genwqe*

Identifies the currently active card application e.g. ‘GZIP’ for compression/decompression.

**/sys/class/genwqe/genwqe<n>\_card/base\_clock**

Defined on file *sysfs-driver-genwqe*

Base clock frequency of the card.

**/sys/class/genwqe/genwqe<n>\_card/curr\_bitstream**

Defined on file *sysfs-driver-genwqe*

Currently active bitstream. 1 is default, 0 is backup.

**/sys/class/genwqe/genwqe<n>\_card/device/sriov\_numvfs**

Defined on file *sysfs-driver-genwqe*

Enable VFs (1..15):

```
sudo sh -c 'echo 15 > \
    /sys/bus/pci/devices/0000\:1b\:00.0/sriov_numvfs'
```

Disable VFs:

```
Write a 0 into the same sysfs entry.
```

**/sys/class/genwqe/genwqe<n>\_card/freerunning\_timer**

Defined on file *sysfs-driver-genwqe*

Interface to read the cards free running timer. Used for performance and utilization measurements.

### **/sys/class/genwqe/genwqe<n>\_card/next\_bitstream**

Defined on file *sysfs-driver-genwqe*

Interface to set the next bitstream to be used.

### **/sys/class/genwqe/genwqe<n>\_card/queue\_working\_time**

Defined on file *sysfs-driver-genwqe*

Interface to read queue working time. Used for performance and utilization measurements.

### **/sys/class/genwqe/genwqe<n>\_card/reload\_bitstream**

Defined on file *sysfs-driver-genwqe*

Interface to trigger a PCIe card reset to reload the bitstream.

```
sudo sh -c 'echo 1 > \
 /sys/class/genwqe/genwqe0_card/reload_bitstream'
```

If successfully, the card will come back with the bitstream set on ‘next\_bitstream’ .

### **/sys/class/genwqe/genwqe<n>\_card/state**

Defined on file *sysfs-driver-genwqe*

State of the card: “unused” , “used” , “error” .

### **/sys/class/genwqe/genwqe<n>\_card/temp sens**

Defined on file *sysfs-driver-genwqe*

Interface to read the cards temperature sense register.

### **/sys/class/genwqe/genwqe<n>\_card/type**

Defined on file *sysfs-driver-genwqe*

Type of the card e.g. ‘GenWQE5-A7’ .

### **/sys/class/genwqe/genwqe<n>\_card/version**

Defined on file *sysfs-driver-genwqe*

Unique bitstream identification e.g. ‘0000000330336283.00000000475a4950’ .

**/sys/class/gnss/gnssN/type**

Defined on file *sysfs-class-gnss*

The GNSS receiver type. The currently identified types reflect the protocol(s) supported by the receiver:

“NMEA”	NMEA 0183
“SiRF”	SiRF Binary
“UBX”	UBX

Note that also non- “NMEA” type receivers typically support a subset of NMEA 0183 with vendor extensions (e.g. to allow switching to a vendor protocol).

**/sys/class/habanalabs/hl<n>/armcp\_kernel\_ver**

Defined on file *sysfs-driver-habanalabs*

Version of the Linux kernel running on the device’ s CPU. Will be DEPRECATED in Linux kernel version 5.10, and be replaced with cpucp\_kernel\_ver

**/sys/class/habanalabs/hl<n>/armcp\_ver**

Defined on file *sysfs-driver-habanalabs*

Version of the application running on the device’ s CPU Will be DEPRECATED in Linux kernel version 5.10, and be replaced with cpucp\_ver

**/sys/class/habanalabs/hl<n>/clk\_cur\_freq\_mhz**

Defined on file *sysfs-driver-habanalabs*

Displays the current frequency, in MHz, of the device clock. This property is valid only for the Gaudi ASIC family

**/sys/class/habanalabs/hl<n>/clk\_max\_freq\_mhz**

Defined on file *sysfs-driver-habanalabs*

Allows the user to set the maximum clock frequency, in MHz. The device clock might be set to lower value than the maximum. The user should read the clk\_cur\_freq\_mhz to see the actual frequency value of the device clock. This property is valid only for the Gaudi ASIC family

**/sys/class/habanalabs/hl<n>/cpId\_ver**

Defined on file *sysfs-driver-habanalabs*

Version of the Device' s CPLD F/W

**/sys/class/habanalabs/hl<n>/cpucp\_kernel\_ver**

Defined on file *sysfs-driver-habanalabs*

Version of the Linux kernel running on the device' s CPU

**/sys/class/habanalabs/hl<n>/cpucp\_ver**

Defined on file *sysfs-driver-habanalabs*

Version of the application running on the device' s CPU

**/sys/class/habanalabs/hl<n>/device\_type**

Defined on file *sysfs-driver-habanalabs*

Displays the code name of the device according to its type. The supported values are: "GOYA"

**/sys/class/habanalabs/hl<n>/eeprom**

Defined on file *sysfs-driver-habanalabs*

A binary file attribute that contains the contents of the on-board EEPROM

**/sys/class/habanalabs/hl<n>/fuse\_ver**

Defined on file *sysfs-driver-habanalabs*

Displays the device' s version from the eFuse

**/sys/class/habanalabs/hl<n>/hard\_reset**

Defined on file *sysfs-driver-habanalabs*

Interface to trigger a hard-reset operation for the device. Hard-reset will reset ALL internal components of the device except for the PCI interface and the internal PLLs

**/sys/class/habanalabs/hl<n>/hard\_reset\_cnt**

Defined on file *sysfs-driver-habanalabs*

Displays how many times the device have undergone a hard-reset operation since the driver was loaded

---

### **/sys/class/habanalabs/hl<n>/high\_pll**

---

Defined on file *sysfs-driver-habanalabs*

Allows the user to set the maximum clock frequency for MME, TPC and IC when the power management profile is set to “automatic”. This property is valid only for the Goya ASIC family

---

### **/sys/class/habanalabs/hl<n>/ic\_clk**

---

Defined on file *sysfs-driver-habanalabs*

Allows the user to set the maximum clock frequency, in Hz, of the Interconnect fabric. Writes to this parameter affect the device only when the power management profile is set to “manual” mode. The device IC clock might be set to lower value than the maximum. The user should read the `ic_clk_curr` to see the actual frequency value of the IC. This property is valid only for the Goya ASIC family

---

### **/sys/class/habanalabs/hl<n>/ic\_clk\_curr**

---

Defined on file *sysfs-driver-habanalabs*

Displays the current clock frequency, in Hz, of the Interconnect fabric. This property is valid only for the Goya ASIC family

---

### **/sys/class/habanalabs/hl<n>/infineon\_ver**

---

Defined on file *sysfs-driver-habanalabs*

Version of the Device’s power supply F/W code

---

### **/sys/class/habanalabs/hl<n>/max\_power**

---

Defined on file *sysfs-driver-habanalabs*

Allows the user to set the maximum power consumption of the device in milliwatts.

---

### **/sys/class/habanalabs/hl<n>/mme\_clk**

---

Defined on file *sysfs-driver-habanalabs*

Allows the user to set the maximum clock frequency, in Hz, of the MME compute engine. Writes to this parameter affect the device only when the power management profile is set to “manual” mode. The device MME clock might be set to lower value than the maximum. The user should read the `mme_clk_curr` to see the actual frequency value of the MME. This property is valid only for the Goya ASIC family

---

### **/sys/class/habanalabs/hl<n>/mme\_clk\_curr**

---

Defined on file *sysfs-driver-habanalabs*

Displays the current clock frequency, in Hz, of the MME compute engine. This property is valid only for the Goya ASIC family

**/sys/class/habanalabs/hl<n>/pci\_addr**

Defined on file *sysfs-driver-habanalabs*

Displays the PCI address of the device. This is needed so the user would be able to open a device based on its PCI address

**/sys/class/habanalabs/hl<n>/pm\_mng\_profile**

Defined on file *sysfs-driver-habanalabs*

Power management profile. Values are “auto” , “manual” . In “auto” mode, the driver will set the maximum clock frequency to a high value when a user-space process opens the device’ s file (unless it was already opened by another process). The driver will set the max clock frequency to a low value when there are no user processes that are opened on the device’ s file. In “manual” mode, the user sets the maximum clock frequency by writing to ic\_clk, mme\_clk and tpc\_clk. This property is valid only for the Goya ASIC family

**/sys/class/habanalabs/hl<n>/preboot\_btl\_ver**

Defined on file *sysfs-driver-habanalabs*

Version of the device’ s preboot F/W code

**/sys/class/habanalabs/hl<n>/soft\_reset**

Defined on file *sysfs-driver-habanalabs*

Interface to trigger a soft-reset operation for the device. Soft-reset will reset only the compute and DMA engines of the device

**/sys/class/habanalabs/hl<n>/soft\_reset\_cnt**

Defined on file *sysfs-driver-habanalabs*

Displays how many times the device have undergone a soft-reset operation since the driver was loaded

**/sys/class/habanalabs/hl<n>/status**

Defined on file *sysfs-driver-habanalabs*

Status of the card: “Operational” , “Malfunction” , “In reset” .

---

**/sys/class/habanalabs/hl<n>/thermal\_ver**

Defined on file *sysfs-driver-habanalabs*

Version of the Device' s thermal daemon

---

**/sys/class/habanalabs/hl<n>/tpc\_clk**

Defined on file *sysfs-driver-habanalabs*

Allows the user to set the maximum clock frequency, in Hz, of the TPC compute engines. Writes to this parameter affect the device only when the power management profile is set to “manual” mode. The device TPC clock might be set to lower value than the maximum. The user should read the tpc\_clk\_curr to see the actual frequency value of the TPC. This property is valid only for Goya ASIC family

---

**/sys/class/habanalabs/hl<n>/tpc\_clk\_curr**

Defined on file *sysfs-driver-habanalabs*

Displays the current clock frequency, in Hz, of the TPC compute engines. This property is valid only for the Goya ASIC family

---

**/sys/class/habanalabs/hl<n>/uboot\_ver**

Defined on file *sysfs-driver-habanalabs*

Version of the u-boot running on the device' s CPU

---

**/sys/class/input/input(x)/device/shutdown**

Defined on file *sysfs-driver-input-axp-pek*

Shutdown time in us. Board is powered off if the button is pressed for more than <shutdown\_time>

---

**/sys/class/input/input(x)/device/startup**

Defined on file *sysfs-driver-input-axp-pek*

Startup time in us. Board is powered on if the button is pressed for more than <startup\_time>

---

**/sys/class/iommu/<iommu>/amd-iommu/cap**

Defined on file *sysfs-class-iommu-amd-iommu*

IOMMU capability header as documented in the AMD IOMMU specification. Format: %x

### **/sys/class/iommu/<iommu>/amd-iommu/features**

Defined on file *sysfs-class-iommu-amd-iommu*

Extended features of the IOMMU. Format: %llx

### **/sys/class/iommu/<iommu>/devices/**

Defined on file *sysfs-class-iommu*

IOMMU drivers are able to link devices managed by a given IOMMU here to allow association of IOMMU to device.

### **/sys/class/iommu/<iommu>/intel-iommu/address**

Defined on file *sysfs-class-iommu-intel-iommu*

Physical address of the VT-d DRHD for this IOMMU. Format: %llx. This allows association of a sysfs intel-iommu with a DMAR DRHD table entry.

### **/sys/class/iommu/<iommu>/intel-iommu/cap**

Defined on file *sysfs-class-iommu-intel-iommu*

The cached hardware capability register value of this DRHD unit. Format: %llx.

### **/sys/class/iommu/<iommu>/intel-iommu/ecap**

Defined on file *sysfs-class-iommu-intel-iommu*

The cached hardware extended capability register value of this DRHD unit. Format: %llx.

### **/sys/class/iommu/<iommu>/intel-iommu/version**

Defined on file *sysfs-class-iommu-intel-iommu*

The architecture version as reported from the VT-d VER\_REG. Format: %d:%d, major:minor

### **/sys/class/lcd/<lcd>/contrast**

Defined on file *sysfs-class-lcd*

Current contrast of this LCD device. Value is between 0 and /sys/class/lcd/<lcd>/max\_contrast.

---

**/sys/class/lcd/<lcd>/lcd\_power**

---

Defined on file *sysfs-class-lcd*

**Control LCD power, values are FB\_BLANK\_\* from fb.h**

- FB\_BLANK\_UNBLANK (0) : power on.
- FB\_BLANK\_POWERDOWN (4) : power off

---

**/sys/class/lcd/<lcd>/max\_contrast**

---

Defined on file *sysfs-class-lcd*

Maximum contrast for this LCD device.

---

**/sys/class/leds/<led>/als\_channel**

---

Defined on file *sysfs-class-led-driver-lm3533*

Set the ALS output channel to use as input in ALS-current-control mode (1, 2), where:

1	out_current1
2	out_current2

---

**/sys/class/leds/<led>/als\_en**

---

Defined on file *sysfs-class-led-driver-lm3533*

Enable ALS-current-control mode (0, 1).

---

**/sys/class/leds/<led>/brightness**

---

Defined on file *sysfs-class-led*

Set the brightness of the LED.

Most LEDs don't have hardware brightness support, so will just be turned on for non-zero brightness settings.

---

**Note:** For multicolor LEDs, writing to this file will update all LEDs within the group to a calculated percentage of what each color LED intensity is set to.

The percentage is calculated for each grouped LED via the equation below:

<code>led_brightness = brightness * multi_intensity/max_brightness</code>
---

For additional details please refer to [/leds/leds-class-multicolor](#).

---

The value is between 0 and [/sys/class/leds/<led>/max\\_brightness](#).

Writing 0 to this file clears active trigger.

Writing non-zero to this file while trigger is active changes the top brightness trigger is going to use.

### **/sys/class/leds/<led>/brightness\_hw\_changed**

Defined on file [sysfs-class-led](#)

Last hardware set brightness level for this LED. Some LEDs may be changed autonomously by hardware/firmware. Only LEDs where this happens and the driver can detect this, will have this file.

This file supports poll() to detect when the hardware changes the brightness.

Reading this file will return the last brightness level set by the hardware, this may be different from the current brightness. Reading this file when no hw brightness change event has happened will return an ENODATA error.

### **/sys/class/leds/<led>/delay\_off**

Defined on file [sysfs-class-led-trigger-oneshot](#)

Specifies for how many milliseconds the LED has to stay at LED\_OFF brightness after it has been armed. Defaults to 100 ms.

### **/sys/class/leds/<led>/delay\_on**

Defined on file [sysfs-class-led-trigger-oneshot](#)

Specifies for how many milliseconds the LED has to stay at LED\_FULL brightness after it has been armed. Defaults to 100 ms.

### **/sys/class/leds/<led>/device/brightness**

Defined on file [sysfs-class-led-driver-turris-omnia](#)

(RW) On the front panel of the Turris Omnia router there is also a button which can be used to control the intensity of all the LEDs at once, so that if they are too bright, user can dim them.

The microcontroller cycles between 8 levels of this global brightness (from 100% to 0%), but this setting can have any integer value between 0 and 100. It is therefore convenient to be able to change this setting from software.

Format: %i

### **/sys/class/leds/<led>/device\_name**

Defined on file [sysfs-class-led-trigger-netdev](#)

Specifies the network device name to monitor.

---

<code>/sys/class/leds/&lt;led&gt;/falltime</code>
<code>/sys/class/leds/&lt;led&gt;/risetime</code>

---

Defined on file [sysfs-class-led-driver-lm3533](#)

Set the pattern generator fall and rise times (0..7), where:

0	2048 us
1	262 ms
2	524 ms
3	1.049 s
4	2.097 s
5	4.194 s
6	8.389 s
7	16.78 s

---

<code>/sys/class/leds/&lt;led&gt;/flash_brightness</code>
---

---

Defined on file [sysfs-class-led-flash](#)

read/write Set the brightness of this LED in the flash strobe mode, in microamperes. The file is created only for the flash LED devices that support setting flash brightness.

The value is between 0 and [/sys/class/leds/<led>/max\\_flash\\_brightness](#).

---

<code>/sys/class/leds/&lt;led&gt;/flash_fault</code>
--

---

Defined on file [sysfs-class-led-flash](#)

read only Space separated list of flash faults that may have occurred. Flash faults are re-read after strobing the flash. Possible flash faults:

- **led-over-voltage**  
flash controller voltage to the flash LED has exceeded the limit specific to the flash controller
- **flash-timeout-exceeded**  
the flash strobe was still on when the timeout set by the user has expired; not all flash controllers may set this in all such conditions
- **controller-over-temperature**  
the flash controller has overheated
- **controller-short-circuit**  
the short circuit protection of the flash controller has been triggered

- **led-power-supply-over-current**  
current in the LED power supply has exceeded the limit specific to the flash controller
- **indicator-led-fault**  
the flash controller has detected a short or open circuit condition on the indicator LED
- **led-under-voltage**  
flash controller voltage to the flash LED has been below the minimum limit specific to the flash
- **controller-under-voltage**  
the input voltage of the flash controller is below the limit under which strobing the flash at full current will not be possible; the condition persists until this flag is no longer set
- **led-over-temperature**  
the temperature of the LED has exceeded its allowed upper limit

---

### `/sys/class/leds/<led>/flash_strobe`

---

Defined on file [sysfs-class-led-flash](#)

read/write Flash strobe state. When written with 1 it triggers flash strobe and when written with 0 it turns the flash off.

On read 1 means that flash is currently strobing and 0 means that flash is off.

---

### `/sys/class/leds/<led>/flash_timeout`

---

Defined on file [sysfs-class-led-flash](#)

read/write Hardware timeout for flash, in microseconds. The flash strobe is stopped after this period of time has passed from the start of the strobe. The file is created only for the flash LED devices that support setting flash timeout.

---

### `/sys/class/leds/<led>/gt683r/mode`

---

Defined on file [sysfs-class-leds-gt683r](#)

Set the mode of LEDs. You should notice that changing the mode of one LED will update the mode of its two sibling devices as well. Possible values are:

0	normal
1	audio
2	breathing

Normal: LEDs are fully on when enabled  
Audio: LEDs brightness depends on sound level  
Breathing: LEDs brightness varies at human breathing rate

**/sys/class/leds/<led>/hw\_pattern**

Defined on file [sysfs-class-led-trigger-pattern](#)

Specify a hardware pattern for the LED, for LED hardware that supports autonomously controlling brightness over time, according to some preprogrammed hardware patterns. It deactivates any active software pattern.

Since different LED hardware can have different semantics of hardware patterns, each driver is expected to provide its own description for the hardware patterns in their documentation file at Documentation/leds/.

**/sys/class/leds/<led>/id**

Defined on file [sysfs-class-led-driver-lm3533](#)

Get the id of this led (0..3).

**/sys/class/leds/<led>/interval**

Defined on file [sysfs-class-led-trigger-netdev](#)

Specifies the duration of the LED blink in milliseconds. Defaults to 50 ms.

**/sys/class/leds/<led>/invert**

Defined on file [sysfs-class-led-trigger-oneshot](#)

Reverse the blink logic. If set to 0 (default) blink on for delay\_on ms, then blink off for delay\_off ms, leaving the LED normally off. If set to 1, blink off for delay\_off ms, then blink on for delay\_on ms, leaving the LED normally on. Setting this value also immediately changes the LED state.

**/sys/class/leds/<led>/inverted**

Defined on file [sysfs-class-led](#)

Invert the LED on/off state. This parameter is specific to gpio and backlight triggers. In case of the backlight trigger, it is useful when driving a LED which is intended to indicate a device in a standby like state.

**/sys/class/leds/<led>/linear**

Defined on file [sysfs-class-led-driver-lm3533](#)

Set the brightness-mapping mode (0, 1), where:

0	exponential mode
1	linear mode

### **/sys/class/leds/<led>/link**

Defined on file [\*sysfs-class-led-trigger-netdev\*](#)

Signal the link state of the named network device.

If set to 0 (default), the LED's normal state is off.

If set to 1, the LED's normal state reflects the link state of the named network device. Setting this value also immediately changes the LED state.

### **/sys/class/leds/<led>/max\_brightness**

Defined on file [\*sysfs-class-led\*](#)

Maximum brightness level for this LED, default is 255 (LED\_FULL).

If the LED does not support different brightness levels, this should be 1.

### **/sys/class/leds/<led>/max\_flash\_brightness**

Defined on file [\*sysfs-class-led-flash\*](#)

read only Maximum brightness level for this LED in the flash strobe mode, in microamperes.

### **/sys/class/leds/<led>/max\_flash\_timeout**

Defined on file [\*sysfs-class-led-flash\*](#)

read only Maximum flash timeout for this LED, in microseconds.

### **/sys/class/leds/<led>/multi\_index**

Defined on file [\*sysfs-class-led-multicolor\*](#)

read The multi\_index array, when read, will output the LED colors as an array of strings as they are indexed in the multi\_intensity file.

For additional details please refer to /leds/leds-class-multicolor.

### **/sys/class/leds/<led>/multi\_intensity**

Defined on file [\*sysfs-class-led-multicolor\*](#)

read/write This file contains array of integers. Order of components is described by the multi\_index array. The maximum intensity should not exceed [\*/sys/class/leds/<led>/max\\_brightness\*](#).

For additional details please refer to /leds/leds-class-multicolor.

---

**/sys/class/leds/<led>/pattern**

---

Defined on file [sysfs-class-led-trigger-pattern](#)

Specify a software pattern for the LED, that supports altering the brightness for the specified duration with one software timer. It can do gradual dimming and step change of brightness.

The pattern is given by a series of tuples, of brightness and duration (ms).

The exact format is described in: Documentation/devicetree/bindings/leds/leds-trigger-pattern.txt

---

**/sys/class/leds/<led>/ports/<port>**

---

Defined on file [sysfs-class-led-trigger-usbport](#)

Every dir entry represents a single USB port that can be selected for the USB port trigger. Selecting ports makes trigger observing them for any connected devices and lighting on LED if there are any.

Echoing “1” value selects USB port. Echoing “0” unselects it. Current state can be also read.

---

**/sys/class/leds/<led>/pwm**

---

Defined on file [sysfs-class-led-driver-lm3533](#)

Set the PWM-input control mask (5 bits), where:

bit 5	PWM-input enabled in Zone 4
bit 4	PWM-input enabled in Zone 3
bit 3	PWM-input enabled in Zone 2
bit 2	PWM-input enabled in Zone 1
bit 1	PWM-input enabled in Zone 0
bit 0	PWM-input enabled

---

---

**/sys/class/leds/<led>/repeat**

---

Defined on file [sysfs-class-led-driver-el15203000](#)

Defined on file [sysfs-class-led-trigger-pattern](#)

EL15203000 supports only indefinitely patterns, so this file should always store -1.

For more info, please see: [testing/sysfs-class-led-trigger-pattern](#) Specify a pattern repeat number. -1 means repeat indefinitely, other negative numbers and number 0 are invalid.

This file will always return the originally written repeat number.

### **/sys/class/leds/<led>/rx**

Defined on file *sysfs-class-led-trigger-netdev*

Signal reception of data on the named network device.

If set to 0 (default), the LED will not blink on reception.

If set to 1, the LED will blink for the milliseconds specified in interval to signal reception.

### **/sys/class/leds/<led>/shot**

Defined on file *sysfs-class-led-trigger-oneshot*

Write any non-empty string to signal an events, this starts a blink sequence if not already running.

### **/sys/class/leds/<led>/trigger**

Defined on file *sysfs-class-led*

Set the trigger for this LED. A trigger is a kernel based source of LED events.

You can change triggers in a similar manner to the way an IO scheduler is chosen. Trigger specific parameters can appear in /sys/class/leds/<led> once a given trigger is selected. For their documentation see *sysfs-class-led-trigger-\**.

### **/sys/class/leds/<led>/tx**

Defined on file *sysfs-class-led-trigger-netdev*

Signal transmission of data on the named network device.

If set to 0 (default), the LED will not blink on transmission.

If set to 1, the LED will blink for the milliseconds specified in interval to signal transmission.

---

```
/sys/class/leds/SRWS1::<serial>::RPM1
/sys/class/leds/SRWS1::<serial>::RPM2
/sys/class/leds/SRWS1::<serial>::RPM3
/sys/class/leds/SRWS1::<serial>::RPM4
/sys/class/leds/SRWS1::<serial>::RPM5
/sys/class/leds/SRWS1::<serial>::RPM6
/sys/class/leds/SRWS1::<serial>::RPM7
/sys/class/leds/SRWS1::<serial>::RPM8
/sys/class/leds/SRWS1::<serial>::RPM9
/sys/class/leds/SRWS1::<serial>::RPM10
/sys/class/leds/SRWS1::<serial>::RPM11
/sys/class/leds/SRWS1::<serial>::RPM12
/sys/class/leds/SRWS1::<serial>::RPM13
/sys/class/leds/SRWS1::<serial>::RPM14
/sys/class/leds/SRWS1::<serial>::RPM15
/sys/class/leds/SRWS1::<serial>::RPMALL
```

---

Defined on file *sysfs-driver-hid-srws1*

Provides a control for turning on/off the LEDs which form an RPM meter on the front of the controller

---

```
/sys/class/leds/dell::kbd_backlight/als_enabled
```

---

Defined on file *sysfs-platform-dell-laptop*

This file allows to control the automatic keyboard illumination mode on some systems that have an ambient light sensor. Write 1 to this file to enable the auto mode, 0 to disable it.

---

```
/sys/class/leds/dell::kbd_backlight/als_setting
```

---

Defined on file *sysfs-platform-dell-laptop*

This file allows to specify the on/off threshold value, as reported by the ambient light sensor.

---

```
/sys/class/leds/dell::kbd_backlight/start_triggers
```

---

Defined on file *sysfs-platform-dell-laptop*

This file allows to control the input triggers that turn on the keyboard backlight illumination that is disabled because of inactivity. Read the file to see the triggers available. The ones enabled are preceded by ‘+’ , those disabled by ‘-’ .

To enable a trigger, write its name preceded by ‘+’ to this file. To disable a trigger, write its name preceded by ‘-’ instead.

For example, to enable the keyboard as trigger run:

```
echo +keyboard > /sys/class/leds/dell::kbd_backlight/start_triggers
```

To disable it:

```
echo -keyboard > /sys/class/leds/dell::kbd_backlight/start_triggers
```

Note that not all the available triggers can be configured.

### **/sys/class/leds/dell::kbd\_backlight/stop\_timeout**

Defined on file *sysfs-platform-dell-laptop*

This file allows to specify the interval after which the keyboard illumination is disabled because of inactivity. The timeouts are expressed in seconds, minutes, hours and days, for which the symbols are ‘s’ , ‘m’ , ‘h’ and ‘d’ respectively.

To configure the timeout, write to this file a value along with any the above units. If no unit is specified, the value is assumed to be expressed in seconds.

For example, to set the timeout to 10 minutes run:

```
echo 10m > /sys/class/leds/dell::kbd_backlight/stop_timeout
```

Note that when this file is read, the returned value might be expressed in a different unit than the one used when the timeout was set.

Also note that only some timeouts are supported and that some systems might fall back to a specific timeout in case an invalid timeout is written to this file.

### **/sys/class/mdio\_bus/<bus>/<device>/attached\_dev**

Defined on file *sysfs-class-net-phydev*

Symbolic link to the network device this PHY device is attached to.

### **/sys/class/mdio\_bus/<bus>/<device>/phy\_has\_fixups**

Defined on file *sysfs-class-net-phydev*

This attribute contains the boolean value whether a given PHY device has had any “fixup” workaround running on it, encoded as a boolean. This information is provided to help troubleshooting PHY configurations.

### **/sys/class/mdio\_bus/<bus>/<device>/phy\_id**

Defined on file *sysfs-class-net-phydev*

This attribute contains the 32-bit PHY Identifier as reported by the device during bus enumeration, encoded in hexadecimal. This ID is used to match the device with the appropriate driver.

---

**/sys/class/mdio\_bus/<bus>/<device>/phy\_interface**

---

Defined on file *sysfs-class-net-phydev*

This attribute contains the PHY interface as configured by the Ethernet driver during bus enumeration, encoded in string. This interface mode is used to configure the Ethernet MAC with the appropriate mode for its data lines to the PHY hardware.

Possible values are:

<empty> (not available), mii, gmii, sgmii, tbi, rev-mii, rmii, rgmii, rgmii-id, rgmii-rxid, rgmii-txid, rtbi, smii xgmii, moca, qsgmii, trgmii, 1000base-x, 2500base-x, rxaui, xau, 10gbase-kr, unknown

---

**/sys/class/mdio\_bus/<bus>/<device>/phy\_standalone**

---

Defined on file *sysfs-class-net-phydev*

Boolean value indicating whether the PHY device is used in standalone mode, without a net\_device associated, by PHYLINK. Attribute created only when this is the case.

---

**/sys/class/mei/**

---

Defined on file *sysfs-class-mei*

The mei/ class sub-directory belongs to mei device class

---

**/sys/class/mei/meiN/**

---

Defined on file *sysfs-class-mei*

The /sys/class/mei/meiN directory is created for each probed mei device

---

**/sys/class/mei/meiN/dev\_state**

---

Defined on file *sysfs-class-mei*

Display the ME device state.

The device state can have following values: INITIALIZING INIT\_CLIENTS ENABLED RESETTING DISABLED POWER\_DOWN POWER\_UP

---

**/sys/class/mei/meiN/fw\_status**

---

Defined on file *sysfs-class-mei*

Display fw status registers content

The ME FW writes its status information into fw status registers for BIOS and OS to monitor fw health.

The register contains running state, power management state, error codes, and others. The way the registers are decoded depends on PCH or SoC generation. Also number of registers varies between 1 and 6 depending on generation.

---

### **/sys/class/mei/meiN/fw\_ver**

---

Defined on file *sysfs-class-meい*

Display the ME firmware version.

The version of the platform ME firmware is in format: <platform>:<major>. <minor>. <milestone>. <build\_no>. There can be up to three such blocks for different FW components.

---

### **/sys/class/mei/meiN/hbm\_ver**

---

Defined on file *sysfs-class-meい*

Display the negotiated HBM protocol version.

The HBM protocol version negotiated between the driver and the device.

---

### **/sys/class/mei/meiN/hbm\_ver\_drv**

---

Defined on file *sysfs-class-meい*

Display the driver HBM protocol version.

The HBM protocol version supported by the driver.

---

### **/sys/class/mei/meiN/kind**

---

Defined on file *sysfs-class-meい*

Display kind of the device

Generic devices are marked as “mei” while special purpose have their own names. Available options: - mei: generic mei device. - itouch: itouch (ipts) mei device.

---

### **/sys/class/mei/meiN/trc**

---

Defined on file *sysfs-class-meい*

Display trc status register content

The ME FW writes Glitch Detection HW (TRC) status information into trc status register for BIOS and OS to monitor fw health.

---

### **/sys/class/mei/meiN/tx\_queue\_limit**

---

Defined on file *sysfs-class-mei*

Configure tx queue limit

Set maximal number of pending writes per opened session.

---

### /sys/class/mic/

---

Defined on file *sysfs-class-mic*

The mic class directory belongs to Intel MIC devices and provides information per MIC device. An Intel MIC device is a PCIe form factor add-in Coprocessor card based on the Intel Many Integrated Core (MIC) architecture that runs a Linux OS.

---

### /sys/class/mic/mic(x)

---

Defined on file *sysfs-class-mic*

The directories /sys/class/mic/mic0, /sys/class/mic/mic1 etc., represent MIC devices (0,1,..etc). Each directory has information specific to that MIC device.

---

### /sys/class/mic/mic(x)/bootmode

---

Defined on file *sysfs-class-mic*

When read, this sysfs entry provides the current bootmode for the card. This sysfs entry can be written with the following valid strings: a) linux - Boot a Linux image. b) flash - Boot an image for flash updates.

---

### /sys/class/mic/mic(x)/cmdline

---

Defined on file *sysfs-class-mic*

An Intel MIC device runs a Linux OS during its operation. Before booting this card OS, it is possible to pass kernel command line options to configure various features in it, similar to self-bootable machines. When read, this entry provides information about the current kernel command line options set to boot the card OS. This entry can be written to change the existing kernel command line options. Typically, the user would want to read the current command line options, append new ones or modify existing ones and then write the whole kernel command line back to this entry.

---

### /sys/class/mic/mic(x)/family

---

Defined on file *sysfs-class-mic*

Provides information about the Coprocessor family for an Intel MIC device. For example - “x100”

---

### /sys/class/mic/mic(x)/firmware

---

Defined on file *sysfs-class-mic*

When read, this sysfs entry provides the path name under /lib/firmware/ where the firmware image to be booted on the card can be found. The entry can be written to change the firmware image location under /lib/firmware/.

### **/sys/class/mic/mic(x)/heartbeat\_enable**

Defined on file *sysfs-class-mic*

The MIC drivers detect and inform user space about card crashes via a heartbeat mechanism (see the description of shutdown\_status above). User space can turn off this notification by setting heartbeat\_enable to 0 and enable it by setting this entry to 1. If this notification is disabled it is the responsibility of user space to detect card crashes via alternative means such as a network ping. This setting is enabled by default.

### **/sys/class/mic/mic(x)/log\_buf\_addr**

Defined on file *sysfs-class-mic*

An Intel MIC device runs a Linux OS during its operation. For debugging purpose and early kernel boot messages, the user can access the card OS log buffer via debugfs. When read, this entry provides the kernel virtual address of the buffer where the card OS log buffer can be read. This entry is written by the host configuration daemon to set the log buffer address. The correct log buffer address to be written can be found in the System.map file of the card OS.

### **/sys/class/mic/mic(x)/log\_buf\_len**

Defined on file *sysfs-class-mic*

An Intel MIC device runs a Linux OS during its operation. For debugging purpose and early kernel boot messages, the user can access the card OS log buffer via debugfs. When read, this entry provides the kernel virtual address where the card OS log buffer length can be read. This entry is written by host configuration daemon to set the log buffer length address. The correct log buffer length address to be written can be found in the System.map file of the card OS.

### **/sys/class/mic/mic(x)/ramdisk**

Defined on file *sysfs-class-mic*

When read, this sysfs entry provides the path name under /lib/firmware/ where the ramdisk image to be used during card OS boot can be found. The entry can be written to change the ramdisk image location under /lib/firmware/.

### **/sys/class/mic/mic(x)/shutdown\_status**

Defined on file *sysfs-class-mic*

An Intel MIC device runs a Linux OS during its operation. This OS can shutdown because of various reasons. When read, this entry provides the status on why the card OS was shutdown. Possible values are:

“nop”	shutdown status is not applicable, when the card OS is “online”
“crashed”	Shutdown because of a HW or SW crash.
“halted”	Shutdown because of a halt command.
“poweroff”	Shutdown because of a poweroff command.
“restart”	Shutdown because of a restart command.

### /sys/class/mic/mic(x)/state

Defined on file *sysfs-class-mic*

When read, this entry provides the current state of an Intel MIC device in the context of the card OS. Possible values that will be read are:

“ready”	The MIC device is ready to boot the card OS. On reading this entry after an OSPM resume, a “boot” has to be written to this entry if the card was previously shutdown during OSPM suspend.
“boot-ing”	The MIC device has initiated booting a card OS.
“on-line”	The MIC device has completed boot and is online
“shutting_down”	The card OS is shutting down.
“resetting”	A reset has been initiated for the MIC device
“reset_failed”	The MIC device has failed to reset.

When written, this sysfs entry triggers different state change operations depending upon the current state of the card OS. Acceptable values are:

“boot”	Boot the card OS image specified by the combination of firmware, ramdisk, cmdline and bootmode sysfs entries.
“reset”	Initiates device reset.
“shutdown”	Initiates card OS shutdown.

### /sys/class/mic/mic(x)/stepping

Defined on file *sysfs-class-mic*

Provides information about the silicon stepping for an Intel MIC device. For example - “A0” or “B0”

### **/sys/class/mtd/**

Defined on file *sysfs-class-mtd*

The mtd/ class subdirectory belongs to the MTD subsystem (MTD core).

### **/sys/class/mtd/mtdX/**

Defined on file *sysfs-class-mtd*

The /sys/class/mtd/mtd{0,1,2,3,⋯} directories correspond to each /dev/mtdX character device. These may represent physical/simulated flash devices, partitions on a flash device, or concatenated flash devices.

### **/sys/class/mtd/mtdX/bad\_blocks**

Defined on file *sysfs-class-mtd*

The number of blocks marked as bad, if any, in this partition.

### **/sys/class/mtd/mtdX/bbt\_blocks**

Defined on file *sysfs-class-mtd*

The number of blocks that are marked as reserved, if any, in this partition. These are typically used to store the in-flash bad block table (BBT).

### **/sys/class/mtd/mtdX/bitflip\_threshold**

Defined on file *sysfs-class-mtd*

This allows the user to examine and adjust the criteria by which mtd returns -EUCLEAN from mtd\_read() and mtd\_read\_oob(). If the maximum number of bit errors that were corrected on any single region comprising an ecc step (as reported by the driver) equals or exceeds this value, -EUCLEAN is returned. Otherwise, absent an error, 0 is returned. Higher layers (e.g., UBI) use this return code as an indication that an erase block may be degrading and should be scrutinized as a candidate for being marked as bad.

The initial value may be specified by the flash device driver. If not, then the default value is ecc\_strength.

The introduction of this feature brings a subtle change to the meaning of the -EUCLEAN return code. Previously, it was interpreted to mean simply “one or more bit errors were corrected”. Its new interpretation can be phrased as “a dangerously high number of bit errors were corrected on one or more regions comprising an ecc step”. The precise definition of “dangerously high” can be adjusted by the user with bitflip\_threshold. Users are discouraged from doing this, however, unless they know what they are doing and have intimate knowledge of the properties of their device. Broadly speaking, bitflip\_threshold should be low

enough to detect genuine erase block degradation, but high enough to avoid the consequences of a persistent return value of -EUCLEAN on devices where sticky bitflips occur. Note that if bitflip\_threshold exceeds ecc\_strength, -EUCLEAN is never returned by the read operations. Conversely, if bitflip\_threshold is zero, -EUCLEAN is always returned, absent a hard error.

This is generally applicable only to NAND flash devices with ECC capability. It is ignored on devices lacking ECC capability; i.e., devices for which ecc\_strength is zero.

---

**/sys/class/mtd/mtdX/corrected\_bits**

---

Defined on file *sysfs-class-mtd*

The number of bits that have been corrected by means of the device's ECC.

It will always be a non-negative integer. In the case of devices lacking any ECC capability, it is 0.

---

**/sys/class/mtd/mtdX/dev**

---

Defined on file *sysfs-class-mtd*

Major and minor numbers of the character device corresponding to this MTD device (in <major>:<minor> format). This is the read-write device so <minor> will be even.

---

**/sys/class/mtd/mtdX/ecc\_failures**

---

Defined on file *sysfs-class-mtd*

The number of failures reported by this device's ECC. Typically, these failures are associated with failed read operations.

It will always be a non-negative integer. In the case of devices lacking any ECC capability, it is 0.

---

**/sys/class/mtd/mtdX/ecc\_step\_size**

---

Defined on file *sysfs-class-mtd*

The size of a single region covered by ECC, known as the ECC step. Devices may have several equally sized ECC steps within each writesize region.

It will always be a non-negative integer. In the case of devices lacking any ECC capability, it is 0.

---

**/sys/class/mtd/mtdX/ecc\_strength**

---

Defined on file *sysfs-class-mtd*

Maximum number of bit errors that the device is capable of correcting within each region covering an ECC step (see `ecc_step_size`). This will always be a non-negative integer.

In the case of devices lacking any ECC capability, it is 0.

### **/sys/class/mtd/mtdX/erasesize**

Defined on file *sysfs-class-mtd*

“Major” erase size for the device. If `numeraregions` is zero, this is the eraseblock size for the entire device. Otherwise, the `MEMGETREGIONCOUNT/MEMGETREGIONINFO` ioctls can be used to determine the actual erase-block layout.

### **/sys/class/mtd/mtdX/flags**

Defined on file *sysfs-class-mtd*

A hexadecimal value representing the device flags, ORed together:

0x0400: `MTD_WRITEABLE` - device is writable 0x0800: `MTD_BIT_WRITEABLE` - single bits can be flipped 0x1000: `MTD_NO_ERASE` - no erase necessary 0x2000: `MTD_POWERUP_LOCK` - always locked after reset

### **/sys/class/mtd/mtdX/name**

Defined on file *sysfs-class-mtd*

A human-readable ASCII name for the device or partition. This will match the name in `/proc/mtd`.

### **/sys/class/mtd/mtdX/numeraregions**

Defined on file *sysfs-class-mtd*

For devices that have variable eraseblock sizes, this provides the total number of erase regions. Otherwise, it will read back as zero.

### **/sys/class/mtd/mtdX/offset**

Defined on file *sysfs-class-mtd*

For a partition, the offset of that partition from the start of the parent (another partition or a flash device) in bytes. This attribute is absent on flash devices, so it can be used to distinguish them from partitions.

### **/sys/class/mtd/mtdX/oobavail**

Defined on file *sysfs-class-mtd*

Number of bytes available for a client to place data into the out of band area.

---

**/sys/class/mtd/mtdX/oobsize**

Defined on file *sysfs-class-mtd*

Number of OOB bytes per page.

---

**/sys/class/mtd/mtdX/size**

Defined on file *sysfs-class-mtd*

Total size of the device/partition, in bytes.

---

**/sys/class/mtd/mtdX/type**

Defined on file *sysfs-class-mtd*

One of the following ASCII strings, representing the device type:  
absent, ram, rom, nor, nand, mlc-nand, dataflash, ubi, unknown

---

**/sys/class/mtd/mtdX/writesize**

Defined on file *sysfs-class-mtd*

Minimal writable flash unit size. This will always be a positive integer.

In the case of NOR flash it is 1 (even though individual bits can be cleared).

In the case of NAND flash it is one NAND page (or a half page, or a quarter page).

In the case of ECC NOR, it is the ECC block size.

---

**/sys/class/mtd/mtdXro/**

Defined on file *sysfs-class-mtd*

These directories provide the corresponding read-only device nodes for */sys/class/mtd/mtdX/*.

---

**/sys/class/mtd/mtdXro/dev**

Defined on file *sysfs-class-mtd*

Major and minor numbers of the character device corresponding to the read-only variant of this MTD device (in <major>:<minor> format). In this case <minor> will be odd.

---

**/sys/class/mux/**

Defined on file *sysfs-class-mux*

The mux/ class sub-directory belongs to the Generic MUX Framework and provides a sysfs interface for using MUX controllers.

### **/sys/class/mux/muxchipN/**

Defined on file *sysfs-class-mux*

A /sys/class/mux/muxchipN directory is created for each probed MUX chip where N is a simple enumeration.

### **/sys/class/net/<bridge iface>/bridge/group\_fwd\_mask**

Defined on file *sysfs-class-net*

Bitmask to allow forwarding of link local frames with address 01-80-C2-00-00-0X on a bridge device. Only values that set bits not matching BR\_GROUPFWD\_RESTRICTED in net/bridge/br\_private.h allowed. Default value 0 does not forward any link local frames.

Restricted bits:

0	01-80-C2-00-00-00	Bridge Group Address used for STP
1	01-80-C2-00-00-01	(MAC Control) 802.3 used for MAC PAUSE
2	01-80-C2-00-00-02	(Link Aggregation) 802.3ad

Any values not setting these bits can be used. Take special care when forwarding control frames e.g. 802.1X-PAE or LLDP.

### **/sys/class/net/<iface>/addr\_assign\_type**

Defined on file *sysfs-class-net*

Indicates the address assignment type. Possible values are:

0	permanent address
1	randomly generated
2	stolen from another device
3	set using dev_set_mac_address

### **/sys/class/net/<iface>/addr\_len**

Defined on file *sysfs-class-net*

Indicates the hardware address size in bytes. Values vary based on the lower-level protocol used by the interface (Ethernet, FDDI, ATM, IEEE 802.15.4…). See include/uapi/linux/if\_\*.h for actual values.

---

**/sys/class/net/<iface>/address**

Defined on file *sysfs-class-net*

Hardware address currently assigned to this interface. Format is a string, e.g: 00:11:22:33:44:55 for an Ethernet MAC address.

---

**/sys/class/net/<iface>/broadcast**

Defined on file *sysfs-class-net*

Hardware broadcast address for this interface. Format is a string, e.g: ff:ff:ff:ff:ff:ff for an Ethernet broadcast MAC address.

---

**/sys/class/net/<iface>/carrier**

Defined on file *sysfs-class-net*

Indicates the current physical link state of the interface. Possssible values are:

0	physical link is down
1	physical link is up

Note: some special devices, e.g: bonding and team drivers will allow this attribute to be written to force a link state for operating correctly and designating another fallback interface.

---

**/sys/class/net/<iface>/carrier\_changes**

Defined on file *sysfs-class-net*

32-bit unsigned integer counting the number of times the link has seen a change from UP to DOWN and vice versa

---

**/sys/class/net/<iface>/carrier\_down\_count**

Defined on file *sysfs-class-net*

32-bit unsigned integer counting the number of times the link has been down

---

**/sys/class/net/<iface>/carrier\_up\_count**

Defined on file *sysfs-class-net*

32-bit unsigned integer counting the number of times the link has been up

---

**/sys/class/net/<iface>/cdc\_ncm/bmNtbFormatsSupported**

Defined on file *sysfs-class-net-cdc\_ncm*

- Bit 0: 16-bit NTB supported (set to 1)
- Bit 1: 32-bit NTB supported
- Bits 2 – 15: reserved (reset to zero; must be ignored by host)

---

**/sys/class/net/<iface>/cdc\_ncm/dwNtbInMaxSize**

---

Defined on file *sysfs-class-net-cdc\_ncm*

IN NTB Maximum Size in bytes

---

**/sys/class/net/<iface>/cdc\_ncm/dwNtbOutMaxSize**

---

Defined on file *sysfs-class-net-cdc\_ncm*

OUT NTB Maximum Size

---

**/sys/class/net/<iface>/cdc\_ncm/min\_tx\_pkt**

---

Defined on file *sysfs-class-net-cdc\_ncm*

The driver will pad NCM Transfer Blocks (NTBs) longer than this to tx\_max, allowing the device to receive tx\_max sized frames with no terminating short packet. NTBs shorter than this limit are transmitted as-is, without any padding, and are terminated with a short USB packet.

Padding to tx\_max allows the driver to transmit NTBs back-to-back without any interleaving short USB packets. This reduces the number of short packet interrupts in the device, and represents a tradeoff between USB bus bandwidth and device DMA optimization.

Set to 0 to pad all frames. Set greater than tx\_max to disable all padding.

---

**/sys/class/net/<iface>/cdc\_ncm/ndp\_to\_end**

---

Defined on file *sysfs-class-net-cdc\_ncm*

Boolean attribute showing the status of the “NDP to end” quirk. Defaults to ‘N’, except for devices already known to need it enabled.

The “NDP to end” quirk makes the driver place the NDP (the packet index table) after the payload. The NCM specification does not mandate this, but some devices are known to be more restrictive. Write ‘Y’ to this attribute for temporary testing of a suspect device failing to work with the default driver settings.

A device entry should be added to the driver if this quirk is found to be required.

---

**/sys/class/net/<iface>/cdc\_ncm/rx\_max**

---

Defined on file *sysfs-class-net-cdc\_ncm*

The maximum NTB size for RX. Cannot exceed the maximum value supported by the device. Must allow at least one max sized datagram plus headers.

The actual limits are device dependent. See dwNtbInMaxSize.

Note: Some devices will silently ignore changes to this value, resulting in oversized NTBs and corresponding framing errors.

---

**/sys/class/net/<iface>/cdc\_ncm/tx\_max**

Defined on file *sysfs-class-net-cdc\_ncm*

The maximum NTB size for TX. Cannot exceed the maximum value supported by the device. Must allow at least one max sized datagram plus headers.

The actual limits are device dependent. See dwNtbOutMaxSize.

---

**/sys/class/net/<iface>/cdc\_ncm/tx\_timer\_usecs**

Defined on file *sysfs-class-net-cdc\_ncm*

Datagram aggregation timeout in  $\mu$ s. The driver will wait up to 3 times this timeout for more datagrams to aggregate before transmitting an NTB frame.

Valid range: 5 to 4000000

Set to 0 to disable aggregation.

The following read-only attributes all represent fields of the structure defined in section 6.2.1 “GetNtbParameters” of “Universal Serial Bus Communications Class Subclass Specifications for Network Control Model Devices” (CDC NCM), Revision 1.0 (Errata 1), November 24, 2010 from USB Implementers Forum, Inc. The descriptions are quoted from table 6-3 of CDC NCM: “NTB Parameter Structure”

.

---

**/sys/class/net/<iface>/cdc\_ncm/wNdpInAlignment**

Defined on file *sysfs-class-net-cdc\_ncm*

NDP alignment modulus for NTBs on the IN pipe. Shall be a power of 2, and shall be at least 4.

---

**/sys/class/net/<iface>/cdc\_ncm/wNdpInDivisor**

Defined on file *sysfs-class-net-cdc\_ncm*

Divisor used for IN NTB Datagram payload alignment

---

**/sys/class/net/<iface>/cdc\_ncm/wNdpInPayloadRemainder**

Defined on file *sysfs-class-net-cdc\_ncm*

Remainder used to align input datagram payload within the NTB: (Payload Offset) mod (wNdpInDivisor) = wNdpInPayloadRemainder

### **/sys/class/net/<iface>/cdc\_ncm/wNdpOutAlignment**

Defined on file *sysfs-class-net-cdc\_ncm*

NDP alignment modulus for use in NTBs on the OUT pipe. Shall be a power of 2, and shall be at least 4.

### **/sys/class/net/<iface>/cdc\_ncm/wNdpOutDivisor**

Defined on file *sysfs-class-net-cdc\_ncm*

OUT NTB Datagram alignment modulus

### **/sys/class/net/<iface>/cdc\_ncm/wNdpOutPayloadRemainder**

Defined on file *sysfs-class-net-cdc\_ncm*

Remainder used to align output datagram payload offsets within the NTB: Padding, shall be transmitted as zero by function, and ignored by host. (Payload Offset) mod (wNdpOutDivisor) = wNdpOutPayloadRemainder

### **/sys/class/net/<iface>/cdc\_ncm/wNtbOutMaxDatagrams**

Defined on file *sysfs-class-net-cdc\_ncm*

Maximum number of datagrams that the host may pack into a single OUT NTB. Zero means that the device imposes no limit.

### **/sys/class/net/<iface>/dev\_id**

Defined on file *sysfs-class-net*

Indicates the device unique identifier. Format is an hexadecimal value. This is used to disambiguate interfaces which might be stacked (e.g: VLAN interfaces) but still have the same MAC address as their parent device.

### **/sys/class/net/<iface>/dev\_port**

Defined on file *sysfs-class-net*

Indicates the port number of this network device, formatted as a decimal value. Some NICs have multiple independent ports on the same PCI bus, device and function. This attribute allows userspace to distinguish the respective interfaces.

Note: some device drivers started to use ‘dev\_id’ for this purpose since long before 3.15 and have not adopted the new attribute ever since. To query the port number, some tools look exclusively at ‘dev\_port’ , while others only consult ‘dev\_id’ . If a network device has multiple client adapter ports as described in the previous paragraph and does not set this attribute to its port number, it’s a kernel bug.

### /sys/class/net/<iface>/dormant

Defined on file *sysfs-class-net*

Indicates whether the interface is in dormant state. Possible values are: 0: interface is not dormant 1: interface is dormant

This attribute can be used by supplicant software to signal that the device is not usable unless some supplicant-based authentication is performed (e.g: 802.1x). ‘link\_mode’ attribute will also reflect the dormant state.

### /sys/class/net/<iface>/dsa/tagging

Defined on file *sysfs-class-net-dsa*

String indicating the type of tagging protocol used by the DSA slave network device.

### /sys/class/net/<iface>/duplex

Defined on file *sysfs-class-net*

Indicates the interface latest or current duplex value. Possible values are:

half	half duplex
full	full duplex

Note: This attribute is only valid for interfaces that implement the ethtool get\_link\_ksettings method (mostly Ethernet).

### /sys/class/net/<iface>/flags

Defined on file *sysfs-class-net*

Indicates the interface flags as a bitmask in hexadecimal. See include/uapi/linux/if.h for a list of all possible values and the flags semantics.

### /sys/class/net/<iface>/fwinfo

Defined on file *sysfs-class-net-janz-ican3*

Firmware stamp of ican3 module Read-only: 32 byte string identification of the ICAN3 module (known values: “JANZ-ICAN3 ICANOS 1.xx”, “JANZ-ICAN3 CAL/CANopen 1.xx” )

### **/sys/class/net/<iface>/grcan/enable0**

Defined on file *sysfs-class-net-grcan*

Hardware configuration of physical interface 0. This file reads and writes the “Enable 0” bit of the configuration register. Possible values: 0 or 1. See the GRCAN chapter of the GRLIB IP core library documentation for details. The default value is 0 or set by the module parameter grcan.enable0 and can be read at /sys/module/grcan/parameters/enable0.

### **/sys/class/net/<iface>/grcan/enable1**

Defined on file *sysfs-class-net-grcan*

Hardware configuration of physical interface 1. This file reads and writes the “Enable 1” bit of the configuration register. Possible values: 0 or 1. See the GRCAN chapter of the GRLIB IP core library documentation for details. The default value is 0 or set by the module parameter grcan.enable1 and can be read at /sys/module/grcan/parameters/enable1.

### **/sys/class/net/<iface>/grcan/select**

Defined on file *sysfs-class-net-grcan*

Configuration of which physical interface to be used. Possible values: 0 or 1. See the GRCAN chapter of the GRLIB IP core library documentation for details. The default value is 0 or is set by the module parameter grcan.select and can be read at /sys/module/grcan/parameters/select.

### **/sys/class/net/<iface>/ifalias**

Defined on file *sysfs-class-net*

Indicates/stores an interface alias name as a string. This can be used for system management purposes.

### **/sys/class/net/<iface>/ifindex**

Defined on file *sysfs-class-net*

Indicates the system-wide interface unique index identifier as a decimal number. This attribute is used for mapping an interface identifier to an interface name. It is used throughout the networking stack for specifying the interface specific requests/events.

**/sys/class/net/<iface>/iflink**

Defined on file *sysfs-class-net*

Indicates the system-wide interface unique index identifier a the interface is linked to. Format is decimal. This attribute is used to resolve interfaces chaining, linking and stacking. Physical interfaces have the same ‘ifindex’ and ‘iflink’ values.

**/sys/class/net/<iface>/link\_mode**

Defined on file *sysfs-class-net*

Indicates the interface link mode, as a decimal number. This attribute should be used in conjunction with ‘dormant’ attribute to determine the interface usability. Possible values:

0	default link mode
1	dormant link mode

**/sys/class/net/<iface>/mtu**

Defined on file *sysfs-class-net*

Indicates the interface currently configured MTU value, in bytes, and in decimal format. Specific values depends on the lower-level interface protocol used. Ethernet devices will show a ‘mtu’ attribute value of 1500 unless changed.

**/sys/class/net/<iface>/name\_assign\_type**

Defined on file *sysfs-class-net*

Indicates the name assignment type. Possible values are:

- 1 enumerated by the kernel, possibly in an unpredictable way
- 2 predictably named by the kernel
- 3 named by userspace
- 4 renamed

**/sys/class/net/<iface>/netdev\_group**

Defined on file *sysfs-class-net*

Indicates the interface network device group, as a decimal integer. Default value is 0 which corresponds to the initial network devices group. The group can be changed to affect routing decisions (see: net/ipv4/fib\_rules and net/ipv6/fib6\_rules.c).

### **/sys/class/net/<iface>/operstate**

Defined on file *sysfs-class-net*

Indicates the interface RFC2863 operational state as a string.

Possible values are:

“unknown” , “notpresent” , “down” , “lowerlayerdown” , “testing” , “dormant” , “up” .

### **/sys/class/net/<iface>/phydev**

Defined on file *sysfs-class-net*

Symbolic link to the PHY device this network device is attached to.

### **/sys/class/net/<iface>/phys\_port\_id**

Defined on file *sysfs-class-net*

Indicates the interface unique physical port identifier within the NIC, as a string.

### **/sys/class/net/<iface>/phys\_port\_name**

Defined on file *sysfs-class-net*

Indicates the interface physical port name within the NIC, as a string.

### **/sys/class/net/<iface>/phys\_switch\_id**

Defined on file *sysfs-class-net*

Indicates the unique physical switch identifier of a switch this port belongs to, as a string.

### **/sys/class/net/<iface>/qmi/add\_mux**

Defined on file *sysfs-class-net-qmi*

Unsigned integer.

Write a number ranging from 1 to 254 to add a qmap mux based network device, supported by recent Qualcomm based modems.

The network device will be called qmimux.

Userspace is in charge of managing the qmumux network device activation and data stream setup on the modem side by using the proper QMI protocol requests.

---

**/sys/class/net/<iface>/qmi/del\_mux**

Defined on file *sysfs-class-net-qmi*

Unsigned integer.

Write a number ranging from 1 to 254 to delete a previously created qmap mux based network device.

---

**/sys/class/net/<iface>/qmi/raw\_ip**

Defined on file *sysfs-class-net-qmi*

Boolean. Default: ‘N’

Set this to ‘Y’ to change the network device link framing from ‘802.3’ to ‘raw-ip’.

The netdev will change to reflect the link framing mode. The netdev is an ordinary ethernet device in ‘802.3’ mode, and the driver expects to exchange frames with an ethernet header over the USB link. The netdev is a headerless p-t-p device in ‘raw-ip’ mode, and the driver expects to exchange IPv4 or IPv6 packets without any L2 header over the USB link.

Userspace is in full control of firmware configuration through the delegation of the QMI protocol. Userspace is responsible for coordination of driver and firmware link framing mode, changing this setting to ‘Y’ if the firmware is configured for ‘raw-ip’ mode.

---

**/sys/class/net/<iface>/queues/rx-<queue>/rps\_cpus**

Defined on file *sysfs-class-net-queues*

Mask of the CPU(s) currently enabled to participate into the Receive Packet Steering packet processing flow for this network device queue. Possible values depend on the number of available CPU(s) in the system.

---

**/sys/class/net/<iface>/queues/rx-<queue>/rps\_flow\_cnt**

Defined on file *sysfs-class-net-queues*

Number of Receive Packet Steering flows being currently processed by this particular network device receive queue.

---

**/sys/class/net/<iface>/queues/tx-<queue>/byte\_queue\_limits/hold\_time**

Defined on file *sysfs-class-net-queues*

Indicates the hold time in milliseconds to measure the slack of this particular network device transmit queue. Default value is 1000.

### **/sys/class/net/<iface>/queues/tx-<queue>/byte\_queue\_limits/inflight**

Defined on file *sysfs-class-net-queues*

Indicates the number of bytes (objects) in flight on this network device transmit queue.

### **/sys/class/net/<iface>/queues/tx-<queue>/byte\_queue\_limits/limit**

Defined on file *sysfs-class-net-queues*

Indicates the current limit of bytes allowed to be queued on this network device transmit queue. This value is clamped to be within the bounds defined by limit\_max and limit\_min.

### **/sys/class/net/<iface>/queues/tx-<queue>/byte\_queue\_limits/limit\_max**

Defined on file *sysfs-class-net-queues*

Indicates the absolute maximum limit of bytes allowed to be queued on this network device transmit queue. See include/linux/dynamic\_queue\_limits.h for the default value.

### **/sys/class/net/<iface>/queues/tx-<queue>/byte\_queue\_limits/limit\_min**

Defined on file *sysfs-class-net-queues*

Indicates the absolute minimum limit of bytes allowed to be queued on this network device transmit queue. Default value is 0.

### **/sys/class/net/<iface>/queues/tx-<queue>/tx\_maxrate**

Defined on file *sysfs-class-net-queues*

A Mbps max-rate set for the queue, a value of zero means disabled, default is disabled.

### **/sys/class/net/<iface>/queues/tx-<queue>/tx\_timeout**

Defined on file *sysfs-class-net-queues*

Indicates the number of transmit timeout events seen by this network interface transmit queue.

### **/sys/class/net/<iface>/queues/tx-<queue>/xps\_cpus**

Defined on file *sysfs-class-net-queues*

Mask of the CPU(s) currently enabled to participate into the Transmit Packet Steering packet processing flow for this network device transmit queue. Possible values depend on the number of available CPU(s) in the system.

---

**/sys/class/net/<iface>/queues/tx-<queue>/xps\_rxqs**

Defined on file *sysfs-class-net-queues*

Mask of the receive queue(s) currently enabled to participate into the Transmit Packet Steering packet processing flow for this network device transmit queue. Possible values depend on the number of available receive queue(s) in the network device. Default is disabled.

---

**/sys/class/net/<iface>/speed**

Defined on file *sysfs-class-net*

Indicates the interface latest or current speed value. Value is an integer representing the link speed in Mbits/sec.

Note: this attribute is only valid for interfaces that implement the ethtool get\_link\_ksettings method (mostly Ethernet).

---

**/sys/class/net/<iface>/statistics/collisions**

Defined on file *sysfs-class-net-statistics*

Indicates the number of collisions seen by this network device. This value might not be relevant with all MAC layers.

---

**/sys/class/net/<iface>/statistics/multicast**

Defined on file *sysfs-class-net-statistics*

Indicates the number of multicast packets received by this network device.

---

**/sys/class/net/<iface>/statistics/rx\_bytes**

Defined on file *sysfs-class-net-statistics*

Indicates the number of bytes received by this network device. See the network driver for the exact meaning of when this value is incremented.

---

**/sys/class/net/<iface>/statistics/rx\_compressed**

Defined on file *sysfs-class-net-statistics*

Indicates the number of compressed packets received by this network device. This value might only be relevant for interfaces that support packet compression (e.g: PPP).

### **/sys/class/net/<iface>/statistics/rx\_crc\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets received with a CRC (FCS) error by this network device. Note that the specific meaning might depend on the MAC layer used by the interface.

### **/sys/class/net/<iface>/statistics/rx\_dropped**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets received by the network device but dropped, that are not forwarded to the upper layers for packet processing. See the network driver for the exact meaning of this value.

### **/sys/class/net/<iface>/statistics/rx\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of receive errors on this network device. See the network driver for the exact meaning of this value.

### **/sys/class/net/<iface>/statistics/rx\_fifo\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of receive FIFO errors seen by this network device. See the network driver for the exact meaning of this value.

### **/sys/class/net/<iface>/statistics/rx\_frame\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of received frames with error, such as alignment errors. Note that the specific meaning depends on the MAC layer protocol used. See the network driver for the exact meaning of this value.

### **/sys/class/net/<iface>/statistics/rx\_length\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of received error packet with a length error, oversized or undersized. See the network driver for the exact meaning of this value.

### **/sys/class/net/<iface>/statistics/rx\_missed\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of received packets that have been missed due to lack of capacity in the receive side. See the network driver for the exact meaning of this value.

---

**/sys/class/net/<iface>/statistics/rx\_nohandler**

Defined on file *sysfs-class-net-statistics*

Indicates the number of received packets that were dropped on an inactive device by the network core.

---

**/sys/class/net/<iface>/statistics/rx\_over\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of received packets that are oversized compared to what the network device is configured to accept (e.g: larger than MTU). See the network driver for the exact meaning of this value.

---

**/sys/class/net/<iface>/statistics/rx\_packets**

Defined on file *sysfs-class-net-statistics*

Indicates the total number of good packets received by this network device.

---

**/sys/class/net/<iface>/statistics/tx\_aborted\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets that have been aborted during transmission by a network device (e.g: because of a medium collision). See the network driver for the exact meaning of this value.

---

**/sys/class/net/<iface>/statistics/tx\_bytes**

Defined on file *sysfs-class-net-statistics*

Indicates the number of bytes transmitted by a network device. See the network driver for the exact meaning of this value, in particular whether this accounts for all successfully transmitted packets or all packets that have been queued for transmission.

---

**/sys/class/net/<iface>/statistics/tx\_carrier\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets that could not be transmitted because of carrier errors (e.g: physical link down). See the network driver for the exact meaning of this value.

### **/sys/class/net/<iface>/statistics/tx\_compressed**

Defined on file *sysfs-class-net-statistics*

Indicates the number of transmitted compressed packets. Note this might only be relevant for devices that support compression (e.g: PPP).

### **/sys/class/net/<iface>/statistics/tx\_dropped**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets dropped during transmission. See the driver for the exact reasons as to why the packets were dropped.

### **/sys/class/net/<iface>/statistics/tx\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets in error during transmission by a network device. See the driver for the exact reasons as to why the packets were dropped.

### **/sys/class/net/<iface>/statistics/tx\_fifo\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets having caused a transmit FIFO error. See the driver for the exact reasons as to why the packets were dropped.

### **/sys/class/net/<iface>/statistics/tx\_heartbeat\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets transmitted that have been reported as heartbeat errors. See the driver for the exact reasons as to why the packets were dropped.

### **/sys/class/net/<iface>/statistics/tx\_packets**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets transmitted by a network device. See the driver for whether this reports the number of all attempted or successful transmissions.

### **/sys/class/net/<iface>/statistics/tx\_window\_errors**

Defined on file *sysfs-class-net-statistics*

Indicates the number of packets not successfully transmitted due to a window collision. The specific meaning depends on the MAC layer used. On Ethernet this is usually used to report late collisions errors.

### **/sys/class/net/<iface>/termination**

Defined on file *sysfs-class-net-janz-ican3*

Value representing the can bus termination

Default: 1 (termination active) Reading: get actual termination state Writing: set actual termination state (0=no termination, 1=termination active)

### **/sys/class/net/<iface>/testing**

Defined on file *sysfs-class-net*

Indicates whether the interface is under test. Possible values are:

0	interface is not being tested
1	interface is being tested

When an interface is under test, it cannot be expected to pass packets as normal.

### **/sys/class/net/<iface>/tx\_queue\_len**

Defined on file *sysfs-class-net*

Indicates the interface transmit queue len in number of packets, as an integer value. Value depend on the type of interface, Ethernet network adapters have a default value of 1000 unless configured otherwise

### **/sys/class/net/<iface>/type**

Defined on file *sysfs-class-net*

Indicates the interface protocol type as a decimal value. See include/uapi/linux/if\_arp.h for all possible values.

### **/sys/class/ocxl/<afu name>/afu\_version**

Defined on file *sysfs-class-ocxl*

read only Version of the AFU, in the format <major>:<minor> Reflects what is read in the configuration space of the AFU

### **/sys/class/ocxl/<afu name>/contexts**

Defined on file *sysfs-class-ocxl*

read only Number of contexts for the AFU, in the format <n>/<max> where:

n	number of currently active contexts, for debug
max	maximum number of contexts supported by the AFU

### **/sys/class/ocxl/<afu name>/global\_mmio\_area**

Defined on file *sysfs-class-ocxl*

read/write Give access the global mmio area for the AFU

### **/sys/class/ocxl/<afu name>/global\_mmio\_size**

Defined on file *sysfs-class-ocxl*

read only Size of the global mmio area, as defined in the configuration space of the AFU

### **/sys/class/ocxl/<afu name>/pp\_mmio\_size**

Defined on file *sysfs-class-ocxl*

read only Size of the per-process mmio area, as defined in the configuration space of the AFU

### **/sys/class/ocxl/<afu name>/reload\_on\_reset**

Defined on file *sysfs-class-ocxl*

read/write Control whether the FPGA is reloaded on a link reset. Enabled through a vendor-specific logic block on the FPGA.

0	Do not reload FPGA image from flash
1	Reload FPGA image from flash
unavailable	The device does not support this capability

### **/sys/class/pktcdvd/add /sys/class/pktcdvd/remove /sys/class/pktcdvd/device\_map**

Defined on file *sysfs-class-pktcdvd*

---

add	(WO) Write a block device id (major:minor) to create a new pktcdvd device and map it to the block device.
remove	(WO) Write the pktcdvd device id (major:minor) to remove the pktcdvd device.
device_map	(RO) Shows the device mapping in format: pktcdvd[0-7] <pktdevid> <blkdevid>

---

**/sys/class/pktcdvd/pktcdvd[0-7]/dev  
/sys/class/pktcdvd/pktcdvd[0-7]/uevent**

---

Defined on file *sysfs-class-pktcdvd*

dev: (RO) Device id

uevent: (WO) To send a uevent

**/sys/class/pktcdvd/pktcdvd[0-7]/stat/packets\_started  
/sys/class/pktcdvd/pktcdvd[0-7]/stat/packets\_finished  
/sys/class/pktcdvd/pktcdvd[0-7]/stat/kb\_written  
/sys/class/pktcdvd/pktcdvd[0-7]/stat/kb\_read  
/sys/class/pktcdvd/pktcdvd[0-7]/stat/kb\_read\_gather  
/sys/class/pktcdvd/pktcdvd[0-7]/stat/reset**

---

Defined on file *sysfs-class-pktcdvd*

packets\_started: (RO) Number of started packets.

packets\_finished: (RO) Number of finished packets.

kb\_written: (RO) kBytes written.

kb\_read: (RO) kBytes read.

kb\_read\_gather: (RO) kBytes read to fill write packets.

**reset: (WO) Write any value to it to reset**

pktcdvd device statistic values, like bytes read/written.

**/sys/class/pktcdvd/pktcdvd[0-7]/write\_queue/size  
/sys/class/pktcdvd/pktcdvd[0-7]/write\_queue/congestion\_off  
/sys/class/pktcdvd/pktcdvd[0-7]/write\_queue/congestion\_on**

---

Defined on file *sysfs-class-pktcdvd*

size	(RO) Contains the size of the bio write queue.
con-	(RW) If bio write queue size is below this mark, accept new bio requests
ges-	from the block layer.
tion_	
con-	(RW) If bio write queue size is higher as this mark, do no longer accept bio
ges-	write requests from the block layer and wait till the pktcdvd device has
tion_	processed enough bio's so that bio write queue size is below congestion
	off mark. A value of <= 0 disables congestion control.

Example:

To use the pktcdvd sysfs interface directly, you can do:

```
# create a new pktcdvd device mapped to /dev/hdc
echo "22:0" >/sys/class/pktcdvd/add
cat /sys/class/pktcdvd/device_map
# assuming device pktcdvd0 was created, look at stat's
cat /sys/class/pktcdvd/pktcdvd0/stat/kb_written
# print the device id of the mapped block device
fgrep pktcdvd0 /sys/class/pktcdvd/device_map
# remove device, using pktcdvd0 device id 253:0
echo "253:0" >/sys/class/pktcdvd/remove
```

### **/sys/class/power/ds2760-battery.\*/charge\_full**

Defined on file *sysfs-class-power*

This file is writeable and can be used to set the assumed battery ‘full level’ . As batteries age, this value has to be amended over time.

### **/sys/class/power/ds2760-battery.\*/charge\_now**

Defined on file *sysfs-class-power*

This file is writeable and can be used to set the current coloumb counter value inside the battery monitor chip. This is needed for unavoidable corrections of aging batteries. A userspace daemon can monitor the battery charging logic and once the counter drops out of considerable bounds, take appropriate action.

### **/sys/class/power\_supply/<supply\_name>/capacity**

Defined on file *sysfs-class-power*

Fine grain representation of battery capacity.

Access: Read

Valid values: 0 - 100 (percent)

### **/sys/class/power\_supply/<supply\_name>/capacity\_alert\_max**

Defined on file *sysfs-class-power*

Maximum battery capacity trip-wire value where the supply will notify user-space of the event. This is normally used for the battery discharging scenario where user-space needs to know the battery has dropped to an upper level so it can take appropriate action (e.g. warning user that battery level is low).

Access: Read, Write

Valid values: 0 - 100 (percent)

---

**/sys/class/power\_supply/<supply\_name>/capacity\_alert\_min**

---

Defined on file *sysfs-class-power*

Minimum battery capacity trip-wire value where the supply will notify user-space of the event. This is normally used for the battery discharging scenario where user-space needs to know the battery has dropped to a lower level so it can take appropriate action (e.g. warning user that battery level is critically low).

Access: Read, Write

Valid values: 0 - 100 (percent)

---

**/sys/class/power\_supply/<supply\_name>/capacity\_error\_margin**

---

Defined on file *sysfs-class-power*

Battery capacity measurement becomes unreliable without recalibration. This values provides the maximum error margin expected to exist by the fuel gauge in percent. Values close to 0% will be returned after (re-)calibration has happened. Over time the error margin will increase. 100% means, that the capacity related values are basically completely useless.

Access: Read

Valid values: 0 - 100 (percent)

---

**/sys/class/power\_supply/<supply\_name>/capacity\_level**

---

Defined on file *sysfs-class-power*

Coarse representation of battery capacity.

Access: Read

**Valid values:**

“Unknown” , “Critical” , “Low” , “Normal” , “High” , “Full”

---

**/sys/class/power\_supply/<supply\_name>/charge\_control\_end\_threshold**

---

Defined on file *sysfs-class-power*

Represents a battery percentage level, above which charging will stop.

Access: Read, Write

Valid values: 0 - 100 (percent)

---

### **/sys/class/power\_supply/<supply\_name>/charge\_control\_limit**

---

Defined on file *sysfs-class-power*

Maximum allowable charging current. Used for charge rate throttling for thermal cooling or improving battery health.

Access: Read, Write

Valid values: Represented in microamps

---

### **/sys/class/power\_supply/<supply\_name>/charge\_control\_limit\_max**

---

Defined on file *sysfs-class-power*

Maximum legal value for the charge\_control\_limit property.

Access: Read

Valid values: Represented in microamps

---

### **/sys/class/power\_supply/<supply\_name>/charge\_control\_start\_threshold**

---

Defined on file *sysfs-class-power*

Represents a battery percentage level, below which charging will begin.

Access: Read, Write Valid values: 0 - 100 (percent)

---

### **/sys/class/power\_supply/<supply\_name>/charge\_term\_current**

---

Defined on file *sysfs-class-power*

Reports the charging current value which is used to determine when the battery is considered full and charging should end.

Access: Read

Valid values: Represented in microamps

---

### **/sys/class/power\_supply/<supply\_name>/charge\_type**

---

Defined on file *sysfs-class-power*

Represents the type of charging currently being applied to the battery. “Trickle”, “Fast”, and “Standard” all mean different charging speeds. “Adaptive” means that the charger uses some algorithm to adjust the charge rate dynamically, without any user configuration required. “Custom” means that the charger uses the charge\_control\_\* properties as configuration for some different algorithm.

Access: Read, Write

**Valid values:**

“Unknown”, “N/A”, “Trickle”, “Fast”, “Standard”, “Adaptive”, “Custom”

---

**/sys/class/power\_supply/<supply\_name>/current\_avg**

Defined on file *sysfs-class-power*

Battery:

Reports an average IBAT current reading for the battery, over a fixed period. Normally devices will provide a fixed interval in which they average readings to smooth out the reported value.

USB:

Reports an average IBUS current reading over a fixed period. Normally devices will provide a fixed interval in which they average readings to smooth out the reported value.

Access: Read

Valid values: Represented in microamps. Negative values are used for discharging batteries, positive values for charging batteries and for USB IBUS current.

---

**/sys/class/power\_supply/<supply\_name>/current\_max**

Defined on file *sysfs-class-power*

Battery:

Reports the maximum IBAT current allowed into the battery.

USB:

Reports the maximum IBUS current the supply can support.

Access: Read Valid values: Represented in microamps

---

**/sys/class/power\_supply/<supply\_name>/current\_now**

Defined on file *sysfs-class-power*

Battery:

Reports an instant, single IBAT current reading for the battery. This value is not averaged/smoothed.

Access: Read

USB:

Reports the IBUS current supplied now. This value is generally read-only reporting, unless the ‘online’ state of the supply is set to be programmable, in which case this value can be set within the reported min/max range.

Access: Read, Write

Valid values: Represented in microamps. Negative values are used for discharging batteries, positive values for charging batteries and for USB IBUS current.

### `/sys/class/power_supply/<supply_name>/health`

Defined on file *sysfs-class-power*

Reports the health of the battery or battery side of charger functionality.

Access: Read

#### **Valid values:**

“Unknown”, “Good”, “Overheat”, “Dead”, “Over voltage”, “Unspecified failure”, “Cold”, “Watchdog timer expire”, “Safety timer expire”, “Over current”, “Calibration required”, “Warm”, “Cool”, “Hot”

### `/sys/class/power_supply/<supply_name>/input_current_limit`

Defined on file *sysfs-class-power*

Details the incoming IBUS current limit currently set in the supply. Normally this is configured based on the type of connection made (e.g. A configured SDP should output a maximum of 500mA so the input current limit is set to the same value). Use preferably `input_power_limit`, and for problems that can be solved using power limit use `input_current_limit`.

Access: Read, Write

Valid values: Represented in microamps

### `/sys/class/power_supply/<supply_name>/input_power_limit`

Defined on file *sysfs-class-power*

This entry configures the incoming power limit currently set in the supply. Normally this is configured based on system-level knowledge or user input. Use preferably this feature to limit the incoming power and use current/voltage limit only for problems that can be solved using power limit.

Access: Read, Write

Valid values: Represented in microwatts

### `/sys/class/power_supply/<supply_name>/input_voltage_limit`

Defined on file *sysfs-class-power*

This entry configures the incoming VBUS voltage limit currently set in the supply. Normally this is configured based on system-level knowledge or user input (e.g. This is part of the Pixel C’s thermal management strategy to effectively limit the input power to 5V when the screen is on to meet Google’s skin temperature

targets). Note that this feature should not be used for safety critical things. Use preferably `input_power_limit`, and for problems that can be solved using power limit use `input_voltage_limit`.

Access: Read, Write

Valid values: Represented in microvolts

---

**/sys/class/power\_supply/<supply\_name>/manufacture\_day**

Defined on file *sysfs-class-power*

Reports the day of month when the device has been manufactured.

Access: Read Valid values: 1-31

---

**/sys/class/power\_supply/<supply\_name>/manufacture\_month**

Defined on file *sysfs-class-power*

Reports the month when the device has been manufactured.

Access: Read

Valid values: 1-12

---

**/sys/class/power\_supply/<supply\_name>/manufacture\_year**

Defined on file *sysfs-class-power*

Reports the year (following Gregorian calendar) when the device has been manufactured.

Access: Read

Valid values: Reported as integer

---

**/sys/class/power\_supply/<supply\_name>/manufacturer**

Defined on file *sysfs-class-power*

Reports the name of the device manufacturer.

Access: Read Valid values: Represented as string

---

**/sys/class/power\_supply/<supply\_name>/model\_name**

Defined on file *sysfs-class-power*

Reports the name of the device model.

Access: Read Valid values: Represented as string

### **/sys/class/power\_supply/<supply\_name>/online**

Defined on file *sysfs-class-power*

Indicates if VBUS is present for the supply. When the supply is online, and the supply allows it, then it's possible to switch between online states (e.g. Fixed -> Programmable for a PD\_PPS USB supply so voltage and current can be controlled).

Access: Read, Write

Valid values:

0:	Offline
1:	Online Fixed - Fixed Voltage Supply
2:	Online Programmable - Programmable Voltage Supply

### **/sys/class/power\_supply/<supply\_name>/precharge\_current**

Defined on file *sysfs-class-power*

Reports the charging current applied during pre-charging phase for a battery charge cycle.

Access: Read

Valid values: Represented in microamps

### **/sys/class/power\_supply/<supply\_name>/present**

Defined on file *sysfs-class-power*

Reports whether a battery is present or not in the system.

Access: Read

Valid values:

0:	Absent
1:	Present

### **/sys/class/power\_supply/<supply\_name>/serial\_number**

Defined on file *sysfs-class-power*

Reports the serial number of the device.

Access: Read Valid values: Represented as string

### **/sys/class/power\_supply/<supply\_name>/status**

Defined on file *sysfs-class-power*

Represents the charging status of the battery. Normally this is read-only reporting although for some supplies this can be used to enable/disable charging to the battery.

Access: Read, Write

**Valid values:**

“Unknown” , “Charging” , “Discharging” , “Not charging” , “Full”

---

**/sys/class/power\_supply/<supply\_name>/technology**

---

Defined on file *sysfs-class-power*

Describes the battery technology supported by the supply.

Access: Read

**Valid values:**

“Unknown” , “NiMH” , “Li-ion” , “Li-poly” , “LiFe” , “NiCd” , “LiMn”

---

**/sys/class/power\_supply/<supply\_name>/temp**

---

Defined on file *sysfs-class-power*

Battery:

Reports the current TBAT battery temperature reading.

USB:

Reports the current supply temperature reading. This would normally be the internal temperature of the device itself (e.g TJUNC temperature of an IC)

Access: Read

Valid values: Represented in 1/10 Degrees Celsius

---

**/sys/class/power\_supply/<supply\_name>/temp\_alert\_max**

---

Defined on file *sysfs-class-power*

Battery:

Maximum TBAT temperature trip-wire value where the supply will notify user-space of the event.

USB:

Maximum supply temperature trip-wire value where the supply will notify user-space of the event.

This is normally used for the charging scenario where user-space needs to know if the temperature has crossed an upper threshold so it can take appropriate action (e.g. warning user that the temperature is critically high, and charging has stopped).

Access: Read

Valid values: Represented in 1/10 Degrees Celsius

---

**/sys/class/power\_supply/<supply\_name>/temp\_alert\_min**

---

Defined on file *sysfs-class-power*

Battery:

Minimum TBAT temperature trip-wire value where the supply will notify user-space of the event.

USB:

Minimum supply temperature trip-wire value where the supply will notify user-space of the event.

This is normally used for the charging scenario where user-space needs to know if the temperature has crossed a lower threshold so it can take appropriate action (e.g. warning user that temperature level is high, and charging current has been reduced accordingly to remedy the situation).

Access: Read

Valid values: Represented in 1/10 Degrees Celsius

---

**/sys/class/power\_supply/<supply\_name>/temp\_max**

---

Defined on file *sysfs-class-power*

Battery:

Reports the maximum allowed TBAT battery temperature for charging.

USB:

Reports the maximum allowed supply temperature for operation.

Access: Read

Valid values: Represented in 1/10 Degrees Celsius

---

**/sys/class/power\_supply/<supply\_name>/temp\_min**

---

Defined on file *sysfs-class-power*

Battery:

Reports the minimum allowed TBAT battery temperature for charging.

USB:

Reports the minimum allowed supply temperature for operation.

Access: Read

Valid values: Represented in 1/10 Degrees Celsius

---

**/sys/class/power\_supply/<supply\_name>/type**

---

Defined on file *sysfs-class-power*

Describes the main type of the supply.

Access: Read Valid values: “Battery” , “UPS” , “Mains” , “USB” , “Wireless”

### **Battery and USB properties**

---

**/sys/class/power\_supply/<supply\_name>/usb\_type**

---

Defined on file *sysfs-class-power*

Reports what type of USB connection is currently active for the supply, for example it can show if USB-PD capable source is attached.

Access: Read-Only

#### **Valid values:**

“Unknown” , “SDP” , “DCP” , “CDP” , “ACA” , “C” , “PD” , “PD\_DRP” , “PD\_PPS” , “BrickID”

### **Device Specific Properties**

---

**/sys/class/power\_supply/<supply\_name>/voltage\_avg**

---

Defined on file *sysfs-class-power*

Reports an average VBAT voltage reading for the battery, over a fixed period. Normally devices will provide a fixed interval in which they average readings to smooth out the reported value.

Access: Read

Valid values: Represented in microvolts

### **USB Properties**

---

**/sys/class/power\_supply/<supply\_name>/voltage\_max**

---

Defined on file *sysfs-class-power*

Battery:

Reports the maximum safe VBAT voltage permitted for the battery, during charging.

USB:

Reports the maximum VBUS voltage the supply can support.

Access: Read

Valid values: Represented in microvolts

---

### **/sys/class/power\_supply/<supply\_name>/voltage\_min**

---

Defined on file *sysfs-class-power*

Battery:

Reports the minimum safe VBAT voltage permitted for the battery, during discharging.

USB:

Reports the minimum VBUS voltage the supply can support.

Access: Read

Valid values: Represented in microvolts

---

### **/sys/class/power\_supply/<supply\_name>/voltage\_now**

---

Defined on file *sysfs-class-power*

Battery:

Reports an instant, single VBAT voltage reading for the battery. This value is not averaged/smoothed.

Access: Read

USB:

Reports the VBUS voltage supplied now. This value is generally read-only reporting, unless the ‘online’ state of the supply is set to be programmable, in which case this value can be set within the reported min/max range.

Access: Read, Write

Valid values: Represented in microvolts

## **Battery Properties**

---

### **/sys/class/power\_supply/bq24257-charger/high\_impedance\_enable**

---

Defined on file *sysfs-class-power*

This entry allows enabling the high-impedance mode of bq24257-type charger devices. If enabled, it places the charger IC into low power standby mode with the switch mode controller disabled. When disabled, the charger operates normally. See device datasheet for details.

Valid values:

- 1: enabled
- 0: disabled

---

**/sys/class/power\_supply/bq24257-charger/in\_dpm\_voltage**

---

Defined on file *sysfs-class-power*

This entry configures the input dynamic power path management voltage of bq24257-type charger devices. Once the supply drops to the configured voltage, the input current limit is reduced down to prevent the further drop of the supply. When the IC enters this mode, the charge current is lower than the set value. See device datasheet for details.

Valid values:

- 4200000, 4280000, 4360000, 4440000, 4520000, 4600000, 4680000, 4760000 (all uV)

---

**/sys/class/power\_supply/bq24257-charger/ovp\_voltage**

---

Defined on file *sysfs-class-power*

This entry configures the overvoltage protection feature of bq24257- type charger devices. This feature protects the device and other components against damage from overvoltage on the input supply. See device datasheet for details.

Valid values:

- 6000000, 6500000, 7000000, 8000000, 9000000, 9500000, 10000000, 10500000 (all uV)

---

**/sys/class/power\_supply/bq24257-charger/sysoff\_enable**

---

Defined on file *sysfs-class-power*

This entry allows enabling the sysoff mode of bq24257-type charger devices. If enabled and the input is removed, the internal battery FET is turned off in order to reduce the leakage from the BAT pin to less than 1uA. Note that on some devices/systems this disconnects the battery from the system. See device datasheet for details.

Valid values:

- 1: enabled
- 0: disabled

---

**/sys/class/power\_supply/max14577-charger/device/fast\_charge\_timer**

---

Defined on file *sysfs-class-power*

This entry shows and sets the maximum time the max14577 charger operates in fast-charge mode. When the timer expires the device will terminate fast-charge mode (charging current will drop to 0 A) and will trigger interrupt.

Valid values:

- 5, 6 or 7 (hours),
- 0: disabled.

---

### **/sys/class/power\_supply/max77693-charger/device/fast\_charge\_timer**

---

Defined on file *sysfs-class-power*

This entry shows and sets the maximum time the max77693 charger operates in fast-charge mode. When the timer expires the device will terminate fast-charge mode (charging current will drop to 0 A) and will trigger interrupt.

Valid values:

- 4 - 16 (hours), step by 2 (rounded down)
- 0: disabled.

---

### **/sys/class/power\_supply/max77693-charger/device/top\_off\_threshold\_current**

---

Defined on file *sysfs-class-power*

This entry shows and sets the charging current threshold for entering top-off charging mode. When charging current in fast charge mode drops below this value, the charger will trigger interrupt and start top-off charging mode.

Valid values:

- 100000 - 200000 (microamps), step by 25000 (rounded down)
- 200000 - 350000 (microamps), step by 50000 (rounded down)
- 0: disabled.

---

### **/sys/class/power\_supply/max77693-charger/device/top\_off\_timer**

---

Defined on file *sysfs-class-power*

This entry shows and sets the maximum time the max77693 charger operates in top-off charge mode. When the timer expires the device will terminate top-off charge mode (charging current will drop to 0 A) and will trigger interrupt.

Valid values:

- 0 - 70 (minutes), step by 10 (rounded down)

---

### **/sys/class/power\_supply/mp2629\_battery/batt\_impedance\_compen**

---

Defined on file *sysfs-class-power-mp2629*

Represents a battery impedance compensation to accelerate charging.

Access: Read, Write

Valid values: Represented in milli-ohms. Valid range is [0, 140].

### /sys/class/power\_supply/twl4030\_ac(mode)

Defined on file *sysfs-class-power-twl4030*

Changing mode for ‘ac’ port. Writing to this can disable charging.

Possible values are:

“auto”	draw power as appropriate for detected power source and battery status.
“off”	do not draw any power.

### /sys/class/power\_supply/twl4030\_usb(mode)

Defined on file *sysfs-class-power-twl4030*

Changing mode for USB port. Writing to this can disable charging.

Possible values are:

“auto”	draw power as appropriate for detected power source and battery status.
“off”	do not draw any power.
“continuous”	activate mode described as “linear” in TWL data sheets. This mode uses whatever current is available and doesn’t switch off when voltage drops.
“cyclic”	This is useful for unstable power sources such as bicycle dynamo, but care should be taken that battery is not over-charged.

### /sys/class/power\_supply/wilco-charger/charge\_control\_end\_threshold

Defined on file *sysfs-class-power-wilco*

Used when charge\_type=“Custom”, as described above. Measured in percentages. The valid range is [55, 100].

### /sys/class/power\_supply/wilco-charger/charge\_control\_start\_threshold

Defined on file *sysfs-class-power-wilco*

Used when charge\_type=“Custom”, as described above. Measured in percentages. The valid range is [50, 95].

### **/sys/class/power\_supply/wilco-charger/charge\_type**

Defined on file *sysfs-class-power-wilco*

What charging algorithm to use:

**Standard:**

Fully charges battery at a standard rate.

**Adaptive:**

Battery settings adaptively optimized based on typical battery usage pattern.

**Fast:**

Battery charges over a shorter period.

**Trickle:**

Extends battery lifespan, intended for users who primarily use their Chromebook while connected to AC.

**Custom:**

A low and high threshold percentage is specified. Charging begins when level drops below charge\_control\_start\_threshold, and ceases when level is above charge\_control\_end\_threshold.

**Long Life:**

Customized charge rate for last longer battery life. On Wilco device this mode is pre-configured in the factory through EC's private PID. Swiching to a different mode will be denied by Wilco EC when Long Life mode is enabled.

### **/sys/class/powercap/**

Defined on file *sysfs-class-powercap*

The powercap/ class sub directory belongs to the power cap subsystem. Refer to /power/powercap/powercap for details.

### **/sys/class/powercap/…/<power zone>/constraint\_X\_max\_time\_window\_us**

Defined on file *sysfs-class-powercap*

Maximum allowed time window in micro seconds for this constraint. Here "X" can have values from 0 to max integer.

### **/sys/class/powercap/…/<power zone>/constraint\_X\_min\_time\_window\_us**

Defined on file *sysfs-class-powercap*

Minimum allowed time window in micro seconds for this constraint. Here "X" can have values from 0 to max integer.

### **/sys/class/powercap/…/<power zone>/constraint\_X\_name**

Defined on file *sysfs-class-powercap*

Each power zone can define one or more constraints. Each constraint can have an optional name. Here “X” can have values from 0 to max integer.

**/sys/class/powercap/…/<power zone>/constraint\_X\_power\_limit\_uw**

Defined on file *sysfs-class-powercap*

Power limit in micro-watts should be applicable for the time window specified by “constraint\_X\_time\_window\_us”. Here “X” can have values from 0 to max integer.

**/sys/class/powercap/…/<power zone>/constraint\_X\_time\_window\_us**

Defined on file *sysfs-class-powercap*

Time window in micro seconds. This is used along with constraint\_X\_power\_limit\_uw to define a power constraint. Here “X” can have values from 0 to max integer.

**/sys/class/powercap/…/<power zone>/enabled**

Defined on file *sysfs-class-powercap*

This allows to enable/disable power capping at power zone level. This applies to current power zone and its children.

**/sys/class/powercap/…/<power zone>/energy\_uj**

Defined on file *sysfs-class-powercap*

Current energy counter in micro-joules. Write “0” to reset. If the counter can not be reset, then this attribute is read-only.

**/sys/class/powercap/…/<power zone>/max\_energy\_range\_uj**

Defined on file *sysfs-class-powercap*

Range of the above energy counter in micro-joules.

**/sys/class/powercap/…/<power zone>/max\_power\_range\_uw**

Defined on file *sysfs-class-powercap*

Range of the above power value in micro-watts.

**/sys/class/powercap/…/<power zone>/name**

Defined on file *sysfs-class-powercap*

Specifies the name of this power zone.

**/sys/class/powercap/…/<power zone>/power\_uw**

Defined on file *sysfs-class-powercap*

Current power in micro-watts.

**/sys/class/powercap/<control type>**

Defined on file *sysfs-class-powercap*

A <control type> is a unique name under /sys/class/powercap. Here <control type> determines how the power is going to be controlled. A <control type> can contain multiple power zones.

**/sys/class/powercap/<control type>/…/constraint\_X\_max\_power\_uw**

Defined on file *sysfs-class-powercap*

Maximum allowed power in micro watts for this constraint. Here “X” can have values from 0 to max integer.

**/sys/class/powercap/<control type>/…/constraint\_X\_min\_power\_uw**

Defined on file *sysfs-class-powercap*

Minimum allowed power in micro watts for this constraint. Here “X” can have values from 0 to max integer.

**/sys/class/powercap/<control type>/<power zone>**

Defined on file *sysfs-class-powercap*

A power zone is a single or a collection of devices, which can be independently monitored and controlled. A power zone sysfs entry is qualified with the name of the <control type>. E.g. intel-rapl:0:1:1.

**/sys/class/powercap/<control type>/<power zone>/<child power zone>**

Defined on file *sysfs-class-powercap*

Power zones may be organized in a hierarchy in which child power zones provide monitoring and control for a subset of devices under the parent. For example, if there is a parent power zone for a whole CPU package, each CPU core in it can be a child power zone.

**/sys/class/powercap/<control type>/enabled**

Defined on file *sysfs-class-powercap*

This allows to enable/disable power capping for a “control type” . This status affects every power zone using this “control\_type”.

---

### **/sys/class/pps/**

---

Defined on file *sysfs-pps*

The */sys/class/pps/* directory will contain files and directories that will provide a unified interface to the PPS sources.

---

### **/sys/class/pps/ppsX/**

---

Defined on file *sysfs-pps*

The */sys/class/pps/ppsX/* directory is related to X-th PPS source into the system. Each directory will contain files to manage and control its PPS source.

---

### **/sys/class/pps/ppsX/assert**

---

Defined on file *sysfs-pps*

The */sys/class/pps/ppsX/assert* file reports the assert events and the assert sequence number of the X-th source in the form:

<secs>. <nsec> # <sequence>

If the source has no assert events the content of this file is empty.

---

### **/sys/class/pps/ppsX/clear**

---

Defined on file *sysfs-pps*

The */sys/class/pps/ppsX/clear* file reports the clear events and the clear sequence number of the X-th source in the form:

<secs>. <nsec> # <sequence>

If the source has no clear events the content of this file is empty.

---

### **/sys/class/pps/ppsX/echo**

---

Defined on file *sysfs-pps*

The */sys/class/pps/ppsX/echo* file reports if the X-th does or does not support an “echo” function.

---

### **/sys/class/pps/ppsX mode**

---

Defined on file *sysfs-pps*

The `/sys/class/pps/ppsX mode` file reports the functioning mode of the X-th source in hexadecimal encoding.

Please, refer to `linux/include/linux/pps.h` for further info.

### **/sys/class/pps/ppsX/name**

Defined on file `sysfs-pps`

The `/sys/class/pps/ppsX/name` file reports the name of the X-th source.

### **/sys/class/pps/ppsX/path**

Defined on file `sysfs-pps`

The `/sys/class/pps/ppsX/path` file reports the path name of the device connected with the X-th source.

If the source is not connected with any device the content of this file is empty.

### **/sys/class/ptp/**

Defined on file `sysfs-ptp`

This directory contains files and directories providing a standardized interface to the ancillary features of PTP hardware clocks.

### **/sys/class/ptp/ptpN/**

Defined on file `sysfs-ptp`

This directory contains the attributes of the Nth PTP hardware clock registered into the PTP class driver subsystem.

### **/sys/class/ptp/ptpN/clock\_name**

Defined on file `sysfs-ptp`

This file contains the name of the PTP hardware clock as a human readable string. The purpose of this attribute is to provide the user with a “friendly name” and to help distinguish PHY based devices from MAC based ones. The string does not necessarily have to be any kind of unique id.

### **/sys/class/ptp/ptpN/extts\_enable**

Defined on file `sysfs-ptp`

This write-only file enables or disables external timestamps. To enable external timestamps, write the channel index followed by a “1” into the file. To disable external timestamps, write the channel index followed by a “0” into the file.

### **/sys/class/ptp/ptpN/fifo**

Defined on file *sysfs-ptp*

This file provides timestamps on external events, in the form of three integers: channel index, seconds, and nanoseconds.

### **/sys/class/ptp/ptpN/max\_adjustment**

Defined on file *sysfs-ptp*

This file contains the PTP hardware clock' s maximum frequency adjustment value (a positive integer) in parts per billion.

### **/sys/class/ptp/ptpN/n\_alarms**

Defined on file *sysfs-ptp*

This file contains the number of periodic or one shot alarms offer by the PTP hardware clock.

### **/sys/class/ptp/ptpN/n\_external\_timestamps**

Defined on file *sysfs-ptp*

This file contains the number of external timestamp channels offered by the PTP hardware clock.

### **/sys/class/ptp/ptpN/n\_periodic\_outputs**

Defined on file *sysfs-ptp*

This file contains the number of programmable periodic output channels offered by the PTP hardware clock.

### **/sys/class/ptp/ptpN/n\_pins**

Defined on file *sysfs-ptp*

This file contains the number of programmable pins offered by the PTP hardware clock.

### **/sys/class/ptp/ptpN/period**

Defined on file *sysfs-ptp*

This write-only file enables or disables periodic outputs. To enable a periodic output, write five integers into the file: channel index, start time seconds, start time

nanoseconds, period seconds, and period nanoseconds. To disable a periodic output, set all the seconds and nanoseconds values to zero.

### /sys/class/ptp/ptpN/pins

Defined on file *sysfs-ptp*

This directory contains one file for each programmable pin offered by the PTP hardware clock. The file name is the hardware dependent pin name. Reading from this file produces two numbers, the assigned function (see the *PTP\_PF\_* enumeration values in *linux/ptp\_clock.h*) and the channel number. The function and channel assignment may be changed by two writing numbers into the file.

### /sys/class/ptp/ptpN/pps\_available

Defined on file *sysfs-ptp*

This file indicates whether the PTP hardware clock supports a Pulse Per Second to the host CPU. Reading “1” means that the PPS is supported, while “0” means not supported.

### /sys/class/ptp/ptpN/pps\_enable

Defined on file *sysfs-ptp*

This write-only file enables or disables delivery of PPS events to the Linux PPS subsystem. To enable PPS events, write a “1” into the file. To disable events, write a “0” into the file.

### /sys/class/pwm/

Defined on file *sysfs-class-pwm*

The pwm/ class sub-directory belongs to the Generic PWM Framework and provides a sysfs interface for using PWM channels.

### /sys/class/pwm/pwmchipN/

Defined on file *sysfs-class-pwm*

A /sys/class/pwm/pwmchipN directory is created for each probed PWM controller/chip where N is the base of the PWM chip.

### /sys/class/pwm/pwmchipN/export

Defined on file *sysfs-class-pwm*

Exports a PWM channel from the PWM chip for sysfs control. Value is between 0 and */sys/class/pwm/pwmchipN/npwm* - 1.

---

**/sys/class/pwm/pwmchipN/npwm**

Defined on file *sysfs-class-pwm*

The number of PWM channels supported by the PWM chip.

---

**/sys/class/pwm/pwmchipN/pwmX**

Defined on file *sysfs-class-pwm*

A */sys/class/pwm/pwmchipN/pwmX* directory is created for each exported PWM channel where X is the exported PWM channel number.

---

**/sys/class/pwm/pwmchipN/pwmX/capture**

Defined on file *sysfs-class-pwm*

Capture information about a PWM signal. The output format is a pair unsigned integers (period and duty cycle), separated by a single space.

---

**/sys/class/pwm/pwmchipN/pwmX/duty\_cycle**

Defined on file *sysfs-class-pwm*

Sets the PWM signal duty cycle in nanoseconds.

---

**/sys/class/pwm/pwmchipN/pwmX/enable**

Defined on file *sysfs-class-pwm*

Enable/disable the PWM signal. 0 is disabled 1 is enabled

---

**/sys/class/pwm/pwmchipN/pwmX/period**

Defined on file *sysfs-class-pwm*

Sets the PWM signal period in nanoseconds.

---

**/sys/class/pwm/pwmchipN/pwmX/polarity**

Defined on file *sysfs-class-pwm*

Sets the output polarity of the PWM signal to “normal” or “inversed” .

---

**/sys/class/pwm/pwmchipN/unexport**

Defined on file *sysfs-class-pwm*

Unexports a PWM channel.

### /sys/class/rapidio\_port

Defined on file *sysfs-class-rapidio*

On-chip RapidIO controllers and PCIe-to-RapidIO bridges (referenced as “Master Port” or “mport”) are presented in sysfs as the special class of devices: “rapidio\_port”. The */sys/class/rapidio\_port* subdirectory contains individual subdirectories named as “rapidioN” where N = mport ID registered with RapidIO subsystem.

NOTE: An mport ID is not a RapidIO destination ID assigned to a given local mport device.

### /sys/class/rapidio\_port/rapidioN/port\_destid

Defined on file *sysfs-class-rapidio*

(RO) reports RapidIO destination ID assigned to the given RapidIO mport device. If value 0xFFFFFFFF is returned this means that no valid destination ID have been assigned to the mport (yet). Normally, before enumeration/discovery have been executed only fabric enumerating mports have a valid destination ID assigned to them using “hdid=…” rapidio module parameter.

After enumeration or discovery was performed for a given mport device, the corresponding subdirectory will also contain subdirectories for each child RapidIO device connected to the mport.

The example below shows mport device subdirectory with several child RapidIO devices attached to it:

```
[rio@rapidio ~]$ ls /sys/class/rapidio_port/rapidio0/ -l
total 0
drwxr-xr-x 3 root root      0 Feb 11 15:10 00:e:0001
drwxr-xr-x 3 root root      0 Feb 11 15:10 00:e:0004
drwxr-xr-x 3 root root      0 Feb 11 15:10 00:e:0007
drwxr-xr-x 3 root root      0 Feb 11 15:10 00:s:0002
drwxr-xr-x 3 root root      0 Feb 11 15:10 00:s:0003
drwxr-xr-x 3 root root      0 Feb 11 15:10 00:s:0005
lrwxrwxrwx 1 root root      0 Feb 11 15:11 device -> ../../...
  ↳ 0000:01:00.0
-r--r--r-- 1 root root 4096 Feb 11 15:11 port_destid
drwxr-xr-x 2 root root      0 Feb 11 15:11 power
lrwxrwxrwx 1 root root      0 Feb 11 15:04 subsystem -> ../../...
  ↳ ../../class/rapidio_port
-r--r--r-- 1 root root 4096 Feb 11 15:11 sys_size
-rw-r--r-- 1 root root 4096 Feb 11 15:04 uevent
```

### /sys/class/rapidio\_port/rapidioN/sys\_size

Defined on file *sysfs-class-rapidio*

(RO) reports RapidIO common transport system size:

0 = small (8-bit destination ID, max. 256 devices),

1 = large (16-bit destination ID, max. 65536 devices).

---

**/sys/class/rc/**

---

Defined on file *sysfs-class-rc*

The rc/ class sub-directory belongs to the Remote Controller core and provides a sysfs interface for configuring infrared remote controller receivers.

---

**/sys/class/rc/rcN/**

---

Defined on file *sysfs-class-rc*

A /sys/class/rc/rcN directory is created for each remote control receiver device where N is the number of the receiver.

---

**/sys/class/rc/rcN/filter**

---

Defined on file *sysfs-class-rc*

Sets the scancode filter expected value.

Use in combination with */sys/class/rc/rcN/filter\_mask* to set the expected value of the bits set in the filter mask. If the hardware supports it then scancodes which do not match the filter will be ignored. Otherwise the write will fail with an error.

This value may be reset to 0 if the current protocol is altered.

---

**/sys/class/rc/rcN/filter\_mask**

---

Defined on file *sysfs-class-rc*

Sets the scancode filter mask of bits to compare. Use in combination with */sys/class/rc/rcN/filter* to set the bits of the scancode which should be compared against the expected value. A value of 0 disables the filter to allow all valid scan-codes to be processed.

If the hardware supports it then scancodes which do not match the filter will be ignored. Otherwise the write will fail with an error.

This value may be reset to 0 if the current protocol is altered.

---

**/sys/class/rc/rcN/protocols**

---

Defined on file *sysfs-class-rc*

Reading this file returns a list of available protocols, something like:

```
"rc5 [rc6] nec jvc [sony]"
```

Enabled protocols are shown in [] brackets.

Writing "+proto" will add a protocol to the list of enabled protocols.

Writing "-proto" will remove a protocol from the list of enabled protocols.

Writing "proto" will enable only "proto".

Writing "none" will disable all protocols.

Write fails with EINVAL if an invalid protocol combination or unknown protocol name is used.

### **/sys/class/rc/rcN/wakeup\_data**

Defined on file *sysfs-class-rc-nuvoton*

Reading this file returns the stored CIR wakeup sequence. It starts with a pulse, followed by a space, pulse etc. All values are in microseconds. The same format can be used to store a wakeup sequence in the Nuvoton chip by writing to this file.

Note: Some systems reset the stored wakeup sequence to a factory default on each boot. On such systems store the wakeup sequence in a file and set it on boot using e.g. a udev rule.

### **/sys/class/rc/rcN/wakeup\_filter**

Defined on file *sysfs-class-rc*

Sets the scancode wakeup filter expected value.

Use in combination with */sys/class/rc/rcN/wakeup\_filter\_mask* to set the expected value of the bits set in the wakeup filter mask to trigger a system wake event.

If the hardware supports it and *wakeup\_filter* is not 0 then scancodes which match the filter will wake the system from e.g. suspend to RAM or power off.

Otherwise the write will fail with an error.

This value may be reset to 0 if the wakeup protocol is altered.

### **/sys/class/rc/rcN/wakeup\_filter\_mask**

Defined on file *sysfs-class-rc*

Sets the scancode wakeup filter mask of bits to compare.

Use in combination with */sys/class/rc/rcN/wakeup\_filter* to set the bits of the scancode which should be compared against the expected value to trigger a system wake event.

If the hardware supports it and *wakeup\_filter\_mask* is not 0 then scancodes which match the filter will wake the system from e.g. suspend to RAM or power off.

Otherwise the write will fail with an error.

This value may be reset to 0 if the wakeup protocol is altered.

---

**/sys/class/rc/rcN/wakeup\_protocols**

Defined on file *sysfs-class-rc*

Reading this file returns a list of available protocols to use for the wakeup filter, something like:

```
"rc-5 nec nec-x rc-6-0 rc-6-6a-24 [rc-6-6a-32] rc-6-mce"
```

Note that protocol variants are listed, so “nec”, “sony”, “rc-5”, “rc-6” have their different bit length encodings listed if available.

The enabled wakeup protocol is shown in [] brackets.

Only one protocol can be selected at a time.

Writing “proto” will use “proto” for wakeup events.

Writing “none” will disable wakeup.

Write fails with EINVAL if an invalid protocol combination or unknown protocol name is used, or if wakeup is not supported by the hardware.

---

**/sys/class/regulator/…/bypass**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called bypass. This indicates if the device is in bypass mode.

This will be one of the following strings:

- ‘enabled’
- ‘disabled’
- ‘unknown’

‘enabled’ means the regulator is in bypass mode.

‘disabled’ means that the regulator is regulating.

‘unknown’ means software cannot determine the state, or the reported state is invalid.

---

**/sys/class/regulator/…/max\_microamps**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called max\_microamps. This holds the maximum safe working regulator output current limit setting for this domain measured in microamps, for regulators which support current constraints.

NOTE: this will return the string ‘constraint not defined’ if the power domain has no max microamps constraint defined by platform code.

### **/sys/class/regulator/…/max\_microvolts**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called max\_microvolts. This holds the maximum safe working regulator output voltage setting for this domain measured in microvolts, for regulators which support voltage constraints.

NOTE: this will return the string ‘constraint not defined’ if the power domain has no max microvolts constraint defined by platform code.

### **/sys/class/regulator/…/microamps**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called microamps. This holds the regulator output current limit setting measured in microamps (i.e. E-6 Amps), for regulators which can report the control input for a current limit.

NOTE: This value should not be used to determine the regulator output current level as this value is the same regardless of whether the regulator is enabled or disabled.

### **/sys/class/regulator/…/microvolts**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called microvolts. This holds the regulator output voltage setting measured in microvolts (i.e. E-6 Volts), for regulators which can report the control input for voltage.

NOTE: This value should not be used to determine the regulator output voltage level as this value is the same regardless of whether the regulator is enabled or disabled.

### **/sys/class/regulator/…/min\_microamps**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called min\_microamps. This holds the minimum safe working regulator output current limit setting for this domain measured in microamps, for regulators which support current constraints.

NOTE: this will return the string ‘constraint not defined’ if the power domain has no min microamps constraint defined by platform code.

### **/sys/class/regulator/…/min\_microvolts**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called min\_microvolts. This holds the minimum safe working regulator output voltage setting for this domain measured in microvolts, for regulators which support voltage constraints.

NOTE: this will return the string ‘constraint not defined’ if the power domain has no min microvolts constraint defined by platform code.

### /sys/class/regulator/…/name

Defined on file *sysfs-class-regulator*

Each regulator directory will contain a field called name. This holds a string identifying the regulator for display purposes.

NOTE: this will be empty if no suitable name is provided by platform or regulator drivers.

### /sys/class/regulator/…/num\_users

Defined on file *sysfs-class-regulator*

Each regulator directory will contain a field called num\_users. This holds the number of consumer devices that have called regulator\_enable() on this regulator.

### /sys/class/regulator/…/opmode

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called opmode. This holds the current regulator operating mode, for regulators which can report that control input value.

The opmode value can be one of the following strings:

- ‘fast’
- ‘normal’
- ‘idle’
- ‘standby’
- ‘unknown’

The modes are described in include/linux/regulator/consumer.h

NOTE: This value should not be used to determine the regulator output operating mode as this value is the same regardless of whether the regulator is enabled or disabled. A “status” attribute may be available to determine the actual mode.

### /sys/class/regulator/…/parent

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a link called parent. This points to the parent or supply regulator if one exists.

### **/sys/class/regulator/…/requested\_microamps**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called requested\_microamps. This holds the total requested load current in microamps for this regulator from all its consumer devices.

### **/sys/class/regulator/…/state**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called state. This reports the regulator enable control, for regulators which can report that input value.

This will be one of the following strings:

‘enabled’ ‘disabled’ ‘unknown’

‘enabled’ means the regulator output is ON and is supplying power to the system (assuming no error prevents it).

‘disabled’ means the regulator output is OFF and is not supplying power to the system (unless some non-Linux control has enabled it).

‘unknown’ means software cannot determine the state, or the reported state is invalid.

NOTE: this field can be used in conjunction with microvolts or microamps to determine configured regulator output levels.

### **/sys/class/regulator/…/status**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called “status”. This reports the current regulator status, for regulators which can report that output value.

This will be one of the following strings:

- off
- on
- error
- fast
- normal
- idle
- standby

“off” means the regulator is not supplying power to the system.

“on” means the regulator is supplying power to the system, and the regulator can’t report a detailed operation mode.

“error” indicates an out-of-regulation status such as being disabled due to thermal shutdown, or voltage being unstable because of problems with the input power supply.

“fast”, “normal”, “idle”, and “standby” are all detailed regulator operation modes (described elsewhere). They imply “on”, but provide more detail.

Note that regulator status is a function of many inputs, not limited to control inputs from Linux. For example, the actual load presented may trigger “error” status; or a regulator may be enabled by another user, even though Linux did not enable it.

---

**/sys/class/regulator/…/suspend\_disk\_microvolts**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called `suspend_disk_microvolts`. This holds the regulator output voltage setting for this domain measured in microvolts when the system is suspended to disk, for voltage regulators implementing suspend voltage configuration constraints.

---

**/sys/class/regulator/…/suspend\_disk\_mode**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called `suspend_disk_mode`. This holds the regulator operating mode setting for this domain when the system is suspended to disk, for regulators implementing suspend mode configuration constraints.

---

**/sys/class/regulator/…/suspend\_disk\_state**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called `suspend_disk_state`. This holds the regulator operating state when suspended to disk, for regulators implementing suspend configuration constraints.

This will be one of the same strings reported by the “state” attribute.

---

**/sys/class/regulator/…/suspend\_mem\_microvolts**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called `suspend_mem_microvolts`. This holds the regulator output voltage setting for this domain measured in microvolts when the system is suspended to memory, for voltage regulators implementing suspend voltage configuration constraints.

### **/sys/class/regulator/…/suspend\_mem\_mode**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called suspend\_mem\_mode. This holds the regulator operating mode setting for this domain when the system is suspended to memory, for regulators implementing suspend mode configuration constraints.

### **/sys/class/regulator/…/suspend\_mem\_state**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called suspend\_mem\_state. This holds the regulator operating state when suspended to memory, for regulators implementing suspend configuration constraints.

This will be one of the same strings reported by the “state” attribute.

### **/sys/class/regulator/…/suspend\_standby\_microvolts**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called suspend\_standby\_microvolts. This holds the regulator output voltage setting for this domain measured in microvolts when the system is suspended to standby, for voltage regulators implementing suspend voltage configuration constraints.

### **/sys/class/regulator/…/suspend\_standby\_mode**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called suspend\_standby\_mode. This holds the regulator operating mode setting for this domain when the system is suspended to standby, for regulators implementing suspend mode configuration constraints.

### **/sys/class/regulator/…/suspend\_standby\_state**

Defined on file *sysfs-class-regulator*

Some regulator directories will contain a field called suspend\_standby\_state. This holds the regulator operating state when suspended to standby, for regulators implementing suspend configuration constraints.

This will be one of the same strings reported by the “state” attribute.

### **/sys/class/regulator/…/type**

Defined on file *sysfs-class-regulator*

Each regulator directory will contain a field called type. This holds the regulator type.

This will be one of the following strings:

- ‘voltage’
- ‘current’
- ‘unknown’

‘voltage’ means the regulator output voltage can be controlled by software.

‘current’ means the regulator output current limit can be controlled by software.

‘unknown’ means software cannot control either voltage or current limit.

---

**/sys/class/remoteproc/…/coredump**

---

Defined on file *sysfs-class-remoteproc*

Remote processor coredump configuration

Reports the coredump configuration of the remote processor, which will be one of:

“disabled” “enabled” “inline”

“disabled” means no dump will be collected.

“enabled” means when the remote processor’ s coredump is collected it will be copied to a separate buffer and that buffer is exposed to userspace.

“inline” means when the remote processor’ s coredump is collected userspace will directly read from the remote processor’ s device memory. Extra buffer will not be used to copy the dump. Also recovery process will not proceed until all data is read by userspace.

---

**/sys/class/remoteproc/…/firmware**

---

Defined on file *sysfs-class-remoteproc*

Remote processor firmware

Reports the name of the firmware currently loaded to the remote processor.

To change the running firmware, ensure the remote processor is stopped (using /sys/class/remoteproc/…/state) and write a new filename.

---

**/sys/class/remoteproc/…/name**

---

Defined on file *sysfs-class-remoteproc*

Remote processor name

Reports the name of the remote processor. This can be used by userspace in exactly identifying a remote processor and ease up the usage in modifying the ‘firmware’ or ‘state’ files.

### /sys/class/remoteproc/…/recovery

Defined on file *sysfs-class-remoteproc*

Remote processor recovery mechanism

Reports the recovery mechanism of the remote processor, which will be one of:  
“enabled” “disabled”

“enabled” means, the remote processor will be automatically recovered whenever it crashes. Moreover, if the remote processor crashes while recovery is disabled, it will be automatically recovered too as soon as recovery is enabled.

“disabled” means, a remote processor will remain in a crashed state if it crashes. This is useful for debugging purposes; without it, debugging a crash is substantially harder.

### /sys/class/remoteproc/…/state

Defined on file *sysfs-class-remoteproc*

Remote processor state

Reports the state of the remote processor, which will be one of:

- “offline”
- “suspended”
- “running”
- “crashed”
- “invalid”

“offline” means the remote processor is powered off.

“suspended” means that the remote processor is suspended and must be woken to receive messages.

“running” is the normal state of an available remote processor

“crashed” indicates that a problem/crash has been detected on the remote processor.

“invalid” is returned if the remote processor is in an unknown state.

Writing this file controls the state of the remote processor. The following states can be written:

- “start”
- “stop”

Writing “start” will attempt to start the processor running the firmware indicated by, or written to, /sys/class/remoteproc/…/firmware. The remote processor should transition to “running” state.

Writing “stop” will attempt to halt the remote processor and return it to the “offline” state.

### /sys/class/rnbd-client

Defined on file *sysfs-class-rnbd-client*

Provide information about RNBD-client. All sysfs files that are not read-only provide the usage information on read:

Example:

```
# cat :ref:`\`/sys\class\rnbd\client\ctl\map_device <abi_sys_
→class_rnbd_client_ctl_map_device>`

> Usage: echo "sessname=<name of the rtrs session> path=<[srcaddr,
→]dstaddr>
> [path=<[srcaddr,]dstaddr>] device_path=<full path on remote side>
> [access_mode=<ro|rw|migration>] > map_device
>
> addr ::= [ ip:<ipv4> | ip:<ipv6> | gid:<gid> ]
```

### /sys/class/rnbd-client/ctl/devices/

Defined on file *sysfs-class-rnbd-client*

For each device mapped on the client a new symbolic link is created as /sys/class/rnbd-client/ctl/devices/<device\_id>, which points to the block device created by rnbd (/sys/block/rnbd<N>/). The <device\_id> of each device is created as follows:

- If the ‘device\_path’ provided during mapping contains slashes ( “/” ), they are replaced by exclamation mark ( “!” ) and used as the <device\_id>. Otherwise, the <device\_id> will be the same as the “device\_path” provided.

### /sys/class/rnbd-client/ctl/map\_device

Defined on file *sysfs-class-rnbd-client*

Expected format is the following:

```
sessname=<name of the rtrs session>
path=<[srcaddr,]dstaddr> [path=<[srcaddr,]dstaddr> ...]
device_path=<full path on remote side>
[access_mode=<ro|rw|migration>]
```

Where:

**sessname:**

accepts a string not bigger than 256 chars, which identifies a given session on the client and on the server. I.e. “clt\_hostname-srv\_hostname” could be a natural choice.

**path:**

describes a connection between the client and the server by specifying destination and, when required, the source address. The addresses are to be provided in the following format:

```
ip:<IPv6>
ip:<IPv4>
gid:<GID>
```

for example:

```
path=ip:10.0.0.66
```

The single addr is treated as the destination. The connection will be established to this server from any client IP address.

```
path=ip:10.0.0.66,ip:10.0.1.66
```

First addr is the source address and the second is the destination.

If multiple “path=” options are specified multiple connection will be established and data will be sent according to the selected multipath policy (see RTRS mp\_policy sysfs entry description).

**device\_path:**

Path to the block device on the server side. Path is specified relative to the directory on server side configured in the ‘dev\_search\_path’ module parameter of the rnbd\_server. The rnbd\_server prepends the <device\_path> received from client with <dev\_search\_path> and tries to open the <dev\_search\_path>/<device\_path> block device. On success, a /dev/rnbd<N> device file, a /sys/block/rnbd\_client/rnbd<N>/ directory and an entry in /sys/class/rnbd-client/ctl/devices will be created.

If ‘dev\_search\_path’ contains ‘%SESSNAME%’ , then each session can have different devices namespace, e.g. server was configured with the following parameter “dev\_search\_path=/run/rnbd-devs/%SESSNAME%” , client has this string “sessname=blya device\_path=sda” , then server will try to open: /run/rnbd-devs/blya/sda.

**access\_mode:**

the access\_mode parameter specifies if the device is to be mapped as “ro” read-only or “rw” read-write. The server allows a device to be exported in rw mode only once. The “migration” access mode has to be specified if a second mapping in read-write mode is desired.

By default “rw” is used.

Exit Codes:

If the device is already mapped it will fail with EEXIST. If the input has an invalid format it will return EINVAL. If the device path cannot be found on the server, it

will fail with ENOENT.

### Finding device file after mapping

After mapping, the device file can be found by:

- o The symlink `/sys/class/rnbd-client/ctl/devices/<device_id>` points to `/sys/block/<dev-name>`. The last part of the symlink destination is the same as the device name. By extracting the last part of the path the path to the device `/dev/<dev-name>` can be build.

- `/dev/block/$(cat /sys/class/rnbd-client/ctl/devices/<device_id>/dev)`

How to find the `<device_id>` of the device is described on the next section.

### **/sys/class/rnbd-server**

Defined on file [\*sysfs-class-rnbd-server\*](#)

provide information about RNBD-server.

### **/sys/class/rnbd-server/ctl/**

Defined on file [\*sysfs-class-rnbd-server\*](#)

When a client maps a device, a directory entry with the name of the block device is created under `/sys/class/rnbd-server/ctl/devices/`.

### **/sys/class/rnbd-server/ctl/devices/<device\_name>/block\_dev**

Defined on file [\*sysfs-class-rnbd-server\*](#)

Is a symlink to the sysfs entry of the exported device.

Example: `block_dev` -> `../../../../class/block/ram0`

### **/sys/class/rnbd-server/ctl/devices/<device\_name>/sessions/**

Defined on file [\*sysfs-class-rnbd-server\*](#)

For each client a particular device is exported to, following directory will be created:

`/sys/class/rnbd-server/ctl/devices/<device_name>/sessions/<session-name>/`

When the device is unmapped by that client, the directory will be removed.

### **/sys/class/rnbd-server/ctl/devices/<device\_name>/sessions/<session-name>/access\_mode**

Defined on file [\*sysfs-class-rnbd-server\*](#)

Contains the device access mode: ro, rw or migration.

**/sys/class/rnbd-server/ctl/devices/<device\_name>/sessions/<session-name>/mapping\_path**

Defined on file *sysfs-class-rnbd-server*

Contains the relative device path provided by the user during mapping.

**/sys/class/rnbd-server/ctl/devices/<device\_name>/sessions/<session-name>/read\_only**

Defined on file *sysfs-class-rnbd-server*

Contains ‘1’ if device is mapped read-only, otherwise ‘0’ .

**/sys/class/rtc/**

Defined on file *sysfs-class-rtc*

The rtc/ class subdirectory belongs to the RTC subsystem.

**/sys/class/rtc/rtc0/device/rtc\_calibration**

Defined on file *sysfs-class-rtc-rtc0-device-rtc\_calibration*

Attribute for calibrating ST-Ericsson AB8500 Real Time Clock The rtc\_calibration attribute allows the userspace to calibrate the AB8500.s 32KHz Real Time Clock. Every 60 seconds the AB8500 will correct the RTC’s value by adding to it the value of this attribute.

The range of the attribute is -127 to +127 in units of 30.5 micro-seconds (half-parts-per-million of the 32KHz clock)

Users: The /vendor/st-ericsson/base\_utilities/core/rtc\_calibration daemon uses this interface.

**/sys/class/rtc/rtcX/**

Defined on file *sysfs-class-rtc*

The /sys/class/rtc/rtc{0,1,2,3,⋯} directories correspond to each RTC device.

**/sys/class/rtc/rtcX/date**

Defined on file *sysfs-class-rtc*

(RO) RTC-provided date in YYYY-MM-DD format

**/sys/class/rtc/rtcX/hctosys**

Defined on file *sysfs-class-rtc*

(RO) 1 if the RTC provided the system time at boot via the CONFIG\_RTC\_HCTOSYS kernel option, 0 otherwise

---

**/sys/class/rtc/rtcX/max\_user\_freq**

---

Defined on file *sysfs-class-rtc*

(RW) The maximum interrupt rate an unprivileged user may request from this RTC.

---

**/sys/class/rtc/rtcX/name**

---

Defined on file *sysfs-class-rtc*

(RO) The name of the RTC corresponding to this sysfs directory

---

**/sys/class/rtc/rtcX/offset**

---

Defined on file *sysfs-class-rtc*

(RW) The amount which the rtc clock has been adjusted in firmware. Visible only if the driver supports clock offset adjustment. The unit is parts per billion, i.e. The number of clock ticks which are added to or removed from the rtc's base clock per billion ticks. A positive value makes a day pass more slowly, longer, and a negative value makes a day pass more quickly.

---

**/sys/class/rtc/rtcX/range**

---

Defined on file *sysfs-class-rtc*

Valid time range for the RTC, as seconds from epoch, formatted as [min, max]

---

**/sys/class/rtc/rtcX/since\_epoch**

---

Defined on file *sysfs-class-rtc*

(RO) RTC-provided time as the number of seconds since the epoch

---

**/sys/class/rtc/rtcX/time**

---

Defined on file *sysfs-class-rtc*

(RO) RTC-provided time in 24-hour notation (hh:mm:ss)

---

**/sys/class/rtc/rtcX/wakealarm**

---

Defined on file *sysfs-class-rtc*

(RW) The time at which the clock will generate a system wakeup event. This is a one shot wakeup event, so must be reset after wake if a daily wakeup is required. Format is seconds since the epoch by default, or if there's a leading +, seconds in the future, or if there is a leading +=, seconds ahead of the current alarm.

### /sys/class/rtrs-client

Defined on file *sysfs-class-rtrs-client*

When a user of RTRS API creates a new session, a directory entry with the name of that session is created under /sys/class/rtrs-client/<session-name>/

### /sys/class/rtrs-client/<session-name>/add\_path

Defined on file *sysfs-class-rtrs-client*

RW, adds a new path (connection) to an existing session. Expected format is the following:

```
<[source addr,]destination addr>
*addr ::= [ ip:<ipv4|ipv6> | gid:<gid> ]
```

### /sys/class/rtrs-client/<session-name>/max\_reconnect\_attempts

Defined on file *sysfs-class-rtrs-client*

Maximum number reconnect attempts the client should make before giving up after connection breaks unexpectedly.

### /sys/class/rtrs-client/<session-name>/mp\_policy

Defined on file *sysfs-class-rtrs-client*

Multipath policy specifies which path should be selected on each IO:

**round-robin (0):**

select path in per CPU round-robin manner.

**min-inflight (1):**

select path with minimum inflights.

### /sys/class/rtrs-client/<session-name>/paths/

Defined on file *sysfs-class-rtrs-client*

Each path belonging to a given session is listed here by its source and destination address. When a new path is added to a session by writing to the "add\_path" entry, a directory <src@dst> is created.

### /sys/class/rtrs-client/<session-name>/paths/<src@dst>/disconnect

Defined on file *sysfs-class-rtrs-client*

Write “1” to the file in order to disconnect the path. Operation blocks until RTRS path is disconnected.

---

### **/sys/class/rtrs-client/<session-name>/paths/<src@dst>/dst\_addr**

---

Defined on file *sysfs-class-rtrs-client*

RO, Contains the destination address of the path

---

### **/sys/class/rtrs-client/<session-name>/paths/<src@dst>/hca\_name**

---

Defined on file *sysfs-class-rtrs-client*

RO, Contains the the name of HCA the connection established on.

---

### **/sys/class/rtrs-client/<session-name>/paths/<src@dst>/hca\_port**

---

Defined on file *sysfs-class-rtrs-client*

RO, Contains the port number of active port traffic is going through.

---

### **/sys/class/rtrs-client/<session-name>/paths/<src@dst>/reconnect**

---

Defined on file *sysfs-class-rtrs-client*

Write “1” to the file in order to reconnect the path. Operation is blocking and returns 0 if reconnect was successful.

---

### **/sys/class/rtrs-client/<session-name>/paths/<src@dst>/remove\_path**

---

Defined on file *sysfs-class-rtrs-client*

Write “1” to the file in order to disconnected and remove the path from the session. Operation blocks until the path is disconnected and removed from the session.

---

### **/sys/class/rtrs-client/<session-name>/paths/<src@dst>/src\_addr**

---

Defined on file *sysfs-class-rtrs-client*

RO, Contains the source address of the path

---

### **/sys/class/rtrs-client/<session-name>/paths/<src@dst>/state**

---

Defined on file *sysfs-class-rtrs-client*

RO, Contains “connected” if the session is connected to the peer and fully functional. Otherwise the file contains “disconnected”

### /sys/class/rtrs-client/<session-name>/paths/<src@dst>/stats/cpu\_migration

---

Defined on file *sysfs-class-rtrs-client*

RTRS expects that each HCA IRQ is pinned to a separate CPU. If it's not the case, the processing of an I/O response could be processed on a different CPU than where it was originally submitted. This file shows how many interrupts were generated on a non expected CPU.

**“from:”**

is the CPU on which the IRQ was expected, but not generated.

**“to:”**

is the CPU on which the IRQ was generated, but not expected.

### /sys/class/rtrs-client/<session-name>/paths/<src@dst>/stats/rdma

---

Defined on file *sysfs-class-rtrs-client*

Contains statistics regarding rdma operations and inflight operations. The output consists of 6 values:

```
<read-count> <read-total-size> <write-count> \
<write-total-size> <inflights> <failovered>
```

### /sys/class/rtrs-client/<session-name>/paths/<src@dst>/stats/reconnects

---

Defined on file *sysfs-class-rtrs-client*

Contains 2 unsigned int values, the first one records number of successful reconnects in the path lifetime, the second one records number of failed reconnects in the path lifetime.

### /sys/class/rtrs-client/<session-name>/paths/<src@dst>/stats/reset\_all

---

Defined on file *sysfs-class-rtrs-client*

RW, Read will return usage help, write 0 will clear all the statistics.

## /sys/class/rtrs-server

Defined on file *sysfs-class-rtrs-server*

When a user of RTRS API creates a new session on a client side, a directory entry with the name of that session is created in here.

### /sys/class/rtrs-server/<session-name>/paths/

---

Defined on file *sysfs-class-rtrs-server*

When new path is created by writing to “add\_path” entry on client side, a directory entry named as <source address>@<destination address> is created on server.

---

### **/sys/class/rtrs-server/<session-name>/paths/<src@dst>/disconnect**

---

Defined on file *sysfs-class-rtrs-server*

When “1” is written to the file, the RTRS session is being disconnected. Operations is non-blocking and returns control immediately to the caller.

---

### **/sys/class/rtrs-server/<session-name>/paths/<src@dst>/dst\_addr**

---

Defined on file *sysfs-class-rtrs-server*

RO, Contains the destination address of the path

---

### **/sys/class/rtrs-server/<session-name>/paths/<src@dst>/hca\_name**

---

Defined on file *sysfs-class-rtrs-server*

RO, Contains the the name of HCA the connection established on.

---

### **/sys/class/rtrs-server/<session-name>/paths/<src@dst>/hca\_port**

---

Defined on file *sysfs-class-rtrs-server*

RO, Contains the port number of active port traffic is going through.

---

### **/sys/class/rtrs-server/<session-name>/paths/<src@dst>/src\_addr**

---

Defined on file *sysfs-class-rtrs-server*

RO, Contains the source address of the path

---

### **/sys/class/rtrs-server/<session-name>/paths/<src@dst>/stats/rdma**

---

Defined on file *sysfs-class-rtrs-server*

Contains statistics regarding rdma operations and inflight operations. The output consists of 5 values: <read-count> <read-total-size> <write-count> <write-total-size> <inflights>

---

### **/sys/class/scsi\_device/\*/device/dyn\_cap\_needed**

---

Defined on file *sysfs-driver-ufs*

This file shows the The amount of physical memory needed to be removed from the physical memory resources pool of the particular logical unit. The full information about the attribute could be found at UFS specifications 2.1.

The file is read only.

### **/sys/class/scsi\_device/\*/device/unit\_descriptor/boot\_lun\_id**

Defined on file *sysfs-driver-ufs*

This file shows boot LUN information. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

### **/sys/class/scsi\_device/\*/device/unit\_descriptor/context\_capabilities**

Defined on file *sysfs-driver-ufs*

This file shows the context capabilities. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

### **/sys/class/scsi\_device/\*/device/unit\_descriptor/data\_reliability**

Defined on file *sysfs-driver-ufs*

This file defines the device behavior when a power failure occurs during a write operation. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

### **/sys/class/scsi\_device/\*/device/unit\_descriptor/erase\_block\_size**

Defined on file *sysfs-driver-ufs*

This file shows the erase block size. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

### **/sys/class/scsi\_device/\*/device/unit\_descriptor/large\_unit\_granularity**

Defined on file *sysfs-driver-ufs*

This file shows the granularity of the LUN. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/class/scsi\_device/\*/device/unit\_descriptor/logical\_block\_count**

Defined on file *sysfs-driver-ufs*

This file shows total number of addressable logical blocks. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/class/scsi\_device/\*/device/unit\_descriptor/logical\_block\_size**

Defined on file *sysfs-driver-ufs*

This file shows the size of addressable logical blocks (calculated as an exponent with base 2). This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/class/scsi\_device/\*/device/unit\_descriptor/lun\_memory\_type**

Defined on file *sysfs-driver-ufs*

This file shows LUN memory type. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/class/scsi\_device/\*/device/unit\_descriptor/lun\_queue\_depth**

Defined on file *sysfs-driver-ufs*

This file shows LUN queue depth. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/class/scsi\_device/\*/device/unit\_descriptor/lun\_write\_protect**

Defined on file *sysfs-driver-ufs*

This file shows LUN write protection status. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

**/sys/class/scsi\_device/\*/device/unit\_descriptor/physical\_memory\_resource\_count**

Defined on file *sysfs-driver-ufs*

This file shows the total physical memory resources. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/class/scsi\_device/\*/device/unit\_descriptor/provisioning\_type**

---

Defined on file *sysfs-driver-ufs*

This file shows the thin provisioning type. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/class/scsi\_device/\*/device/unit\_descriptor/psa\_sensitive**

---

Defined on file *sysfs-driver-ufs*

This file shows PSA sensitivity. This is one of the UFS unit descriptor parameters. The full information about the descriptor could be found at UFS specifications 2.1.

The file is read only.

---

### **/sys/class/scsi\_device/\*/device/unit\_descriptor/wb\_buf\_alloc\_units**

---

Defined on file *sysfs-driver-ufs*

This entry shows the configured size of WriteBooster buffer. 0400h corresponds to 4GB.

The file is read only.

---

### **/sys/class/scsi\_host/hostX/acciopath\_status**

---

Defined on file *sysfs-class-scsi\_host*

This file contains the current status of the “SSD Smart Path” feature of HP Smart Array RAID controllers using the hpsa driver. SSD Smart Path, when enabled permits the driver to send i/o requests directly to physical devices that are part of a logical drive, bypassing the controllers firmware RAID stack for a performance advantage when possible. A value of ‘1’ indicates the feature is enabled, and the controller may use the direct i/o path to physical devices. A value of zero means the feature is disabled and the controller may not use the direct i/o path to physical devices. This setting is controller wide, affecting all configured logical drives on the controller. This file is readable and writable.

---

### **/sys/class/scsi\_host/hostX/ahci\_host\_version**

---

Defined on file *sysfs-class-scsi\_host*

(RO) Display the version of the AHCI spec implemented by the host.

---

```
/sys/class/scsi_host/hostX/ahci_port_cmd  
/sys/class/scsi_host/hostX/ahci_host_caps  
/sys/class/scsi_host/hostX/ahci_host_cap2
```

---

Defined on file *sysfs-class-scsi\_host*

[to be documented]

---

```
/sys/class/scsi_host/hostX/em_buffer
```

---

Defined on file *sysfs-class-scsi\_host*

(RW) Allows access to AHCI EM (enclosure management) buffer directly if the host supports EM.

For eg. the AHCI driver supports SGPIO EM messages but the SATA/AHCI specs do not define the SGPIO message format of the EM buffer. Different hardware(HW) vendors may have different definitions. With the em\_buffer attribute, this issue can be solved by allowing HW vendors to provide userland drivers and tools for their SGPIO initiators.

---

```
/sys/class/scsi_host/hostX/em_message  
/sys/class/scsi_host/hostX/em_message_type
```

---

Defined on file *sysfs-class-scsi\_host*

em\_message: (RW) Enclosure management support. For the LED protocol, writes and reads correspond to the LED message format as defined in the AHCI spec.

The user must turn sw\_activity (under /sys/block/\*/device/) OFF if they wish to control the activity LED via the em\_message file.

em\_message\_type: (RO) Displays the current enclosure management protocol that is being used by the driver (for eg. LED, SAF-TE, SES-2, SGPIO etc).

---

```
/sys/class/scsi_host/hostX/em_message_supported
```

---

Defined on file *sysfs-class-scsi\_host*

(RO) Displays supported enclosure management message types.

---

```
/sys/class/scsi_host/hostX/isci_id
```

---

Defined on file *sysfs-class-scsi\_host*

This file contains the enumerated host ID for the Intel SCU controller. The Intel(R) C600 Series Chipset SATA/SAS Storage Control Unit embeds up to two 4-port controllers in a single PCI device. The controllers are enumerated in order which

usually means the lowest number scsi\_host corresponds with the first controller, but this association is not guaranteed. The ‘isci\_id’ attribute unambiguously identifies the controller index: ‘0’ for the first controller, ‘1’ for the second.

### **/sys/class/scsi\_host/hostX/link\_power\_management\_policy**

Defined on file *sysfs-class-scsi\_host*

(RW) This parameter allows the user to read and set the link (interface) power management.

There are four possible options:

min\_power: Tell the controller to try to make the link use the least possible power when possible. This may sacrifice some performance due to increased latency when coming out of lower power states.

max\_performance: Generally, this means no power management. Tell the controller to have performance be a priority over power management.

medium\_power: Tell the controller to enter a lower power state when possible, but do not enter the lowest power state, thus improving latency over min\_power setting.

med\_power\_with\_dipm: Identical to the existing medium\_power setting except that it enables dipm (device initiated power management) on top, which makes it match the Windows IRST (Intel Rapid Storage Technology) driver settings. This setting is also close to min\_power, except that:

- a) It does not use host-initiated slumber mode, but it does allow device-initiated slumber
- b) It does not enable low power device sleep mode (DevSlp).

### **/sys/class/scsi\_tape/\*/stats/in\_flight**

Defined on file *sysfs-class-scsi\_tape*

Show the number of I/Os currently in-flight between the st module and the SCSI mid-layer.

### **/sys/class/scsi\_tape/\*/stats/io\_ns**

Defined on file *sysfs-class-scsi\_tape*

Shows the total amount of time spent waiting for all I/O to and from the tape drive to complete. This includes all reads, writes, and other SCSI commands issued to the tape drive. An example of other SCSI commands would be tape movement such as a rewind when a rewind tape device is closed. This item is measured in nanoseconds.

To determine the amount of time spent waiting for other I/O to complete subtract read\_ns and write\_ns from this value.

---

**/sys/class/scsi\_tape/\*/stats/other\_cnt**

Defined on file *sysfs-class-scsi\_tape*

The number of I/O requests issued to the tape drive other than SCSI read/write requests.

---

**/sys/class/scsi\_tape/\*/stats/read\_byte\_cnt**

Defined on file *sysfs-class-scsi\_tape*

Shows the total number of bytes requested from the tape drive. This value is presented in bytes because tape drives support variable length block sizes.

---

**/sys/class/scsi\_tape/\*/stats/read\_cnt**

Defined on file *sysfs-class-scsi\_tape*

Shows the total number of read requests issued to the tape drive.

---

**/sys/class/scsi\_tape/\*/stats/read\_ns**

Defined on file *sysfs-class-scsi\_tape*

Shows the total amount of time in nanoseconds waiting for read I/O requests to complete.

---

**/sys/class/scsi\_tape/\*/stats/resid\_cnt**

Defined on file *sysfs-class-scsi\_tape*

Shows the number of times we found that a residual >0 was found when the SCSI midlayer indicated that there was an error. For reads this may be a case of someone issuing reads greater than the block size.

---

**/sys/class/scsi\_tape/\*/stats/write\_byte\_cnt**

Defined on file *sysfs-class-scsi\_tape*

Shows the total number of bytes written to the tape drive. This value is presented in bytes because tape drives support variable length block sizes.

---

**/sys/class/scsi\_tape/\*/stats/write\_cnt**

Defined on file *sysfs-class-scsi\_tape*

Shows the total number of write requests issued to the tape drive.

### **/sys/class/scsi\_tape/\*/stats/write\_ms**

Defined on file [sysfs-class-scsi\\_tape](#)

Shows the total amount of time in nanoseconds waiting for write I/O requests to complete.

### **/sys/class/stm/<stm>/channels**

Defined on file [sysfs-class-stm](#)

Shows the number of channels per master on this STM device.

### **/sys/class/stm/<stm>/hw\_override**

Defined on file [sysfs-class-stm](#)

Reads as 0 if master numbers in the STP stream produced by this stm device will match the master numbers assigned by the software or 1 if the stm hardware overrides software assigned masters.

### **/sys/class/stm/<stm>/masters**

Defined on file [sysfs-class-stm](#)

Shows first and last available to software master numbers on this STM device.

### **/sys/class/stm\_source/<stm\_source>/stm\_source\_link**

Defined on file [sysfs-class-stm\\_source](#)

stm\_source device linkage to stm device, where its tracing data is directed. Reads return an existing connection or “<none>” if this stm\_source is not connected to any stm device yet. Write an existing (registered) stm device’s name here to connect that device. If a device is already connected to this stm\_source, it will first be disconnected.

### **/sys/class/switchtec**

Defined on file [sysfs-class-switchtec](#)

The switchtec class subsystem folder. Each registered switchtec driver is represented by a switchtecX subfolder (X being an integer  $\geq 0$ ).

### **/sys/class/switchtec/switchtec[0-9]+/component\_id**

Defined on file [sysfs-class-switchtec](#)

Component identifier as stored in the hardware (eg. PM8543) (read only) Values: arbitrary string.

---

### **/sys/class/switchtec/switchtec[0-9]+/component\_revision**

---

Defined on file *sysfs-class-switchtec*

Component revision stored in the hardware (read only) Values: integer.

---

### **/sys/class/switchtec/switchtec[0-9]+/component\_vendor**

---

Defined on file *sysfs-class-switchtec*

Component vendor as stored in the hardware (eg. MICROSEM) (read only) Values: arbitrary string.

---

### **/sys/class/switchtec/switchtec[0-9]+/device\_version**

---

Defined on file *sysfs-class-switchtec*

Device version as stored in the hardware (read only) Values: integer.

---

### **/sys/class/switchtec/switchtec[0-9]+/fw\_version**

---

Defined on file *sysfs-class-switchtec*

Currently running firmware version (read only) Values: integer (in hexadecimal).

---

### **/sys/class/switchtec/switchtec[0-9]+/partition**

---

Defined on file *sysfs-class-switchtec*

Partition number for this device in the switch (read only) Values: integer.

---

### **/sys/class/switchtec/switchtec[0-9]+/partition\_count**

---

Defined on file *sysfs-class-switchtec*

Total number of partitions in the switch (read only) Values: integer.

---

### **/sys/class/switchtec/switchtec[0-9]+/product\_id**

---

Defined on file *sysfs-class-switchtec*

Product identifier as stored in the hardware (eg. PSX 48XG3) (read only) Values: arbitrary string.

---

### **/sys/class/switchtec/switchtec[0-9]+/product\_revision**

---

Defined on file *sysfs-class-switchtec*

Product revision stored in the hardware (eg. RevB) (read only) Values: arbitrary string.

### **/sys/class/switchtec/switchtec[0-9]+/product\_vendor**

Defined on file *sysfs-class-switchtec*

Product vendor as stored in the hardware (eg. MICROSEM) (read only) Values: arbitrary string.

### **/sys/class/tpm/tpmX/ppi/**

Defined on file *sysfs-driver-ppi*

This folder includes the attributes related with PPI (Physical Presence Interface). Only if TPM is supported by BIOS, this folder makes sense. The folder path can be got by command ‘find /sys/ -name ‘pcrs’’ . For the detail information of PPI, please refer to the PPI specification from

<http://www.trustedcomputinggroup.org/>

In Linux 4.2 ppi was moved to the character device directory. A symlink from tpmX/device/ppi to tpmX/ppi to provide backwards compatibility.

### **/sys/class/tpm/tpmX/ppi/request**

Defined on file *sysfs-driver-ppi*

This attribute shows the request for an operation to be executed in the pre-OS environment. It is the only input from the OS to the pre-OS environment. The request should be an integer value range from 1 to 160, and 0 means no request. This file can be read and written.

### **/sys/class/tpm/tpmX/ppi/response**

Defined on file *sysfs-driver-ppi*

This attribute shows the response to the most recent operation request it acted upon. The format is “<request> <response num> : <response description>” . This file is readonly.

### **/sys/class/tpm/tpmX/ppi/tcg\_operations**

Defined on file *sysfs-driver-ppi*

This attribute shows whether it is allowed to request an operation to be executed in the pre-OS environment by the BIOS for the requests defined by TCG, i.e. requests from 1 to 22. The format is “<request> <status num>: <status description>” . This attribute is only supported by PPI version 1.2+. This file is readonly.

---

**/sys/class/tpm/tpmX/ppi/transition\_action**

Defined on file *sysfs-driver-ppi*

This attribute shows the platform-specific action that should take place in order to transition to the BIOS for execution of a requested operation. The format is “<action num>: <action description>” . This file is readonly.

---

**/sys/class/tpm/tpmX/ppi/version**

Defined on file *sysfs-driver-ppi*

This attribute shows the version of the PPI supported by the platform. This file is readonly.

---

**/sys/class/tpm/tpmX/ppi/vs\_operations**

Defined on file *sysfs-driver-ppi*

This attribute shows whether it is allowed to request an operation to be executed in the pre-OS environment by the BIOS for the vendor specific requests, i.e. requests from 128 to 255. The format is same with tcg\_operations. This attribute is also only supported by PPI version 1.2+. This file is readonly.

---

**/sys/class/tty/console/active**

Defined on file *sysfs-tty*

Shows the list of currently configured console devices, like ‘tty1 ttyS0’ . The last entry in the file is the active device connected to /dev/console. The file supports poll() to detect virtual console switches.

---

**/sys/class/tty/tty0/active**

Defined on file *sysfs-tty*

Shows the currently active virtual console device, like ‘tty1’ . The file supports poll() to detect virtual console switches.

---

**/sys/class/tty/ttyS0/close\_delay**

Defined on file *sysfs-tty*

Show the closing delay time for this port in ms.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

---

**/sys/class/tty/ttyS0/closing\_wait**

Defined on file *sysfs-tty*

Show the close wait time for this port in ms.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

### **/sys/class/tty/ttyS0/console**

Defined on file *sysfs-tty*

Allows user to detach or attach back the given device as kernel console. It shows and accepts a boolean variable.

### **/sys/class/tty/ttyS0/custom\_divisor**

Defined on file *sysfs-tty*

Show the custom divisor if any that is set on this port.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

### **/sys/class/tty/ttyS0/flags**

Defined on file *sysfs-tty*

Show the tty port status flags for this port.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

### **/sys/class/tty/ttyS0/io\_type**

Defined on file *sysfs-tty*

Show the I/O type that is to be used with the iomem base address.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

### **/sys/class/tty/ttyS0/iomem\_base**

Defined on file *sysfs-tty*

The I/O memory base for this port.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

### **/sys/class/tty/ttyS0/iomem\_reg\_shift**

Defined on file *sysfs-tty*

Show the register shift indicating the spacing to be used for accesses on this iomem address.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

---

**/sys/class/tty/ttyS0/irq**

Defined on file *sysfs-tty*

Shows the current primary interrupt for this port.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

---

**/sys/class/tty/ttyS0/line**

Defined on file *sysfs-tty*

Shows the current tty line number for this port.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

---

**/sys/class/tty/ttyS0/port**

Defined on file *sysfs-tty*

Shows the current tty port I/O address for this port.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

---

**/sys/class/tty/ttyS0/rx\_trig\_bytes**

Defined on file *sysfs-tty*

Shows current RX interrupt trigger bytes or sets the user specified value to change it for the FIFO buffer. Users can show or set this value regardless of opening the serial device file or not.

The RX trigger can be set one of four kinds of values for UART serials. When users input a meaning less value to this I/F, the RX trigger is changed to the nearest lower value for the device specification. For example, when user sets 7bytes on 16550A, which has 1/4/8/14 bytes trigger, the RX trigger is automatically changed to 4 bytes.

---

**/sys/class/tty/ttyS0/type**

Defined on file *sysfs-tty*

Shows the current tty type for this port.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

### **/sys/class/tty/ttyS0/uartclk**

Defined on file [sysfs-tty](#)

Shows the current uartclk value associated with the UART port in serial\_core, that is bound to TTY like ttyS0. uartclk = 16 \* baud\_base

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

### **/sys/class/tty/ttyS0/xmit\_fifo\_size**

Defined on file [sysfs-tty](#)

Show the transmit FIFO size for this port.

These sysfs values expose the TIOCGSERIAL interface via sysfs rather than via ioctl.

### **/sys/class/typec/<port>-cable/identity/**

Defined on file [sysfs-class-typec](#)

This directory appears only if the port device driver is capable of showing the result of Discover Identity USB power delivery command. That will not always be possible even when USB power delivery is supported. If the directory exists, it will have an attribute for every VDO returned by Discover Identity command.

### **/sys/class/typec/<port>-cable/identity/cert\_stat**

Defined on file [sysfs-class-typec](#)

Cert Stat VDO part of Discover Identity command result. The value will show 0 until Discover Identity command result becomes available. The value can be polled.

### **/sys/class/typec/<port>-cable/identity/id\_header**

Defined on file [sysfs-class-typec](#)

ID Header VDO part of Discover Identity command result. The value will show 0 until Discover Identity command result becomes available. The value can be polled.

### **/sys/class/typec/<port>-cable/identity/product**

Defined on file *sysfs-class-typec*

Product VDO part of Discover Identity command result. The value will show 0 until Discover Identity command result becomes available. The value can be polled.

USB Type-C port alternate mode devices.

---

**/sys/class/typec/<port>-cable/plug\_type**

---

Defined on file *sysfs-class-typec*

Shows type of the plug on the cable:

- type-a - Standard A
- type-b - Standard B
- type-c
- captive

---

**/sys/class/typec/<port>-cable/type**

---

Defined on file *sysfs-class-typec*

Shows if the cable is active. Valid values: active, passive

---

**/sys/class/typec/<port>-partner/Accessory\_mode**

---

Defined on file *sysfs-class-typec*

Shows the Accessory Mode name when the partner is an Accessory. The Accessory Modes are defined in USB Type-C Specification.

---

**/sys/class/typec/<port>-partner/identity/cert\_stat**

---

Defined on file *sysfs-class-typec*

Cert Stat VDO part of Discover Identity command result. The value will show 0 until Discover Identity command result becomes available. The value can be polled.

---

**/sys/class/typec/<port>-partner/identity/id\_header**

---

Defined on file *sysfs-class-typec*

ID Header VDO part of Discover Identity command result. The value will show 0 until Discover Identity command result becomes available. The value can be polled.

---

**/sys/class/typec/<port>-partner/identity/product**

---

Defined on file *sysfs-class-typec*

Product VDO part of Discover Identity command result. The value will show 0 until Discover Identity command result becomes available. The value can be polled.

USB Type-C cable devices (eg. /sys/class/typec/port0-cable/)

Note: Electronically Marked Cables will have a device also for one cable plug (eg. /sys/class/typec/port0-plug0). If the cable is active and has also SOP Double Prime controller (USB Power Deliver specification ch. 2.4) it will have second device also for the other plug. Both plugs may have alternate modes as described in USB Type-C and USB Power Delivery specifications.

---

### **/sys/class/typec/<port>-partner/supports\_usb\_power\_delivery**

---

Defined on file *sysfs-class-typec*

Shows if the partner supports USB Power Delivery communication: Valid values: yes, no

---

### **/sys/class/typec/<port>-partner>/identity/**

---

Defined on file *sysfs-class-typec*

This directory appears only if the port device driver is capable of showing the result of Discover Identity USB power delivery command. That will not always be possible even when USB power delivery is supported, for example when USB power delivery communication for the port is mostly handled in firmware. If the directory exists, it will have an attribute file for every VDO in Discover Identity command result.

---

### **/sys/class/typec/<port>/<alt mode>/supported\_roles**

---

Defined on file *sysfs-class-typec*

Space separated list of the supported roles.

Valid values: source, sink

---

### **/sys/class/typec/<port>/data\_role**

---

Defined on file *sysfs-class-typec*

The supported USB data roles. This attribute can be used for requesting data role swapping on the port. Swapping is supported as synchronous operation, so write(2) to the attribute will not return until the operation has finished. The attribute is notified about role changes so that poll(2) on the attribute wakes up. Change on the role will also generate uevent KOBJ\_CHANGE on the port. The current role is show in brackets, for example “[host] device” when DRP port is in host mode.

Valid values: host, device

**/sys/class/typec/<port>/orientation**

Defined on file *sysfs-class-typec*

Indicates the active orientation of the Type-C connector. Valid values: - “normal” : CC1 orientation - “reverse” : CC2 orientation - “unknown” : Orientation cannot be determined.

USB Type-C partner devices (eg. /sys/class/typec/port0-partner/)

**/sys/class/typec/<port>/port\_type**

Defined on file *sysfs-class-typec*

Indicates the type of the port. This attribute can be used for requesting a change in the port type. Port type change is supported as a synchronous operation, so write(2) to the attribute will not return until the operation has finished.

Valid values:

source	(The port will behave as source only DFP port)
sink	(The port will behave as sink only UFP port)
dual	(The port will behave as dual-role-data and dual-role-power port)

**/sys/class/typec/<port>/power\_operation\_mode**

Defined on file *sysfs-class-typec*

Shows the current power operational mode the port is in. The power operation mode means current level for VBUS. In case USB Power Delivery communication is used for negotiating the levels, power operation mode should show “usb\_power\_delivery” .

Valid values:

- default
- 1.5A
- 3.0A
- usb\_power\_delivery

**/sys/class/typec/<port>/power\_role**

Defined on file *sysfs-class-typec*

The supported power roles. This attribute can be used to request power role swap on the port. Swapping is supported as synchronous operation, so write(2) to the attribute will not return until the operation has finished. The attribute is notified about role changes so that poll(2) on the attribute wakes up. Change on the role

will also generate uevent KOBJ\_CHANGE. The current role is show in brackets, for example “[source] sink” when in source mode.

Valid values: source, sink

### **/sys/class/typec/<port>/preferred\_role**

Defined on file *sysfs-class-typec*

The user space can notify the driver about the preferred role. It should be handled as enabling of Try.SRC or Try.SNK, as defined in USB Type-C specification, in the port drivers. By default the preferred role should come from the platform.

Valid values: source, sink, none (to remove preference)

### **/sys/class/typec/<port>/supported\_accessory\_modes**

Defined on file *sysfs-class-typec*

Space separated list of accessory modes, defined in the USB Type-C specification, the port supports.

### **/sys/class/typec/<port>/usb\_power\_delivery\_revision**

Defined on file *sysfs-class-typec*

Revision number of the supported USB Power Delivery specification, or 0 when USB Power Delivery is not supported.

### **/sys/class/typec/<port>/usb\_typec\_revision**

Defined on file *sysfs-class-typec*

Revision number of the supported USB Type-C specification.

### **/sys/class/typec/<port>/vconn\_source**

Defined on file *sysfs-class-typec*

Shows is the port VCONN Source. This attribute can be used to request VCONN swap to change the VCONN Source during connection when both the port and the partner support USB Power Delivery. Swapping is supported as synchronous operation, so write(2) to the attribute will not return until the operation has finished. The attribute is notified about VCONN source changes so that poll(2) on the attribute wakes up. Change on VCONN source also generates uevent KOBJ\_CHANGE.

Valid values:

- “no” when the port is not the VCONN Source
- “yes” when the port is the VCONN Source

---

**/sys/class/uacce/<dev\_name>/algorithms**

---

Defined on file *sysfs-driver-uacce*

Algorithms supported by this accelerator, separated by new line. Can be any string and up to userspace to parse.

---

**/sys/class/uacce/<dev\_name>/api**

---

Defined on file *sysfs-driver-uacce*

Api of the device Can be any string and up to userspace to parse. Application use the api to match the correct driver

---

**/sys/class/uacce/<dev\_name>/available\_instances**

---

Defined on file *sysfs-driver-uacce*

Available instances left of the device Return -ENODEV if uacce\_ops get\_available\_instances is not provided

---

**/sys/class/uacce/<dev\_name>/flags**

---

Defined on file *sysfs-driver-uacce*

Attributes of the device, see UACCE\_DEV\_xxx flag defined in uacce.h

---

**/sys/class/uacce/<dev\_name>/region\_dus\_size**

---

Defined on file *sysfs-driver-uacce*

Size (bytes) of dus region queue file

---

**/sys/class/uacce/<dev\_name>/region\_mmio\_size**

---

Defined on file *sysfs-driver-uacce*

Size (bytes) of mmio region queue file

---

**/sys/class/udc/udc.name/device/gadget/video4linux/video.name/function\_name**

---

Defined on file *configfs-usb-gadget-uvc*

UVC configfs function instance name

---

**/sys/class/usb\_role/**

---

Defined on file *sysfs-class-usb\_role*

Place in sysfs for USB Role Switches. USB Role Switch is a device that can select the data role (host or device) for USB port.

**/sys/class/usb\_role/<switch>/role**

Defined on file *sysfs-class-usb\_role*

The current role of the switch. This attribute can be used for requesting role swapping with non-USB Type-C ports. With USB Type-C ports, the ABI defined for USB Type-C connector class must be used.

Valid values: - none - host - device

**/sys/class/uwb\_rc**

Defined on file *sysfs-class-uwb\_rc*

Interfaces for WiMedia Ultra Wideband Common Radio Platform (UWB) radio controllers.

Familiarity with the ECMA-368 ‘High Rate Ultra Wideband MAC and PHY Specification’ is assumed.

**/sys/class/uwb\_rc/beacon\_timeout\_ms**

Defined on file *sysfs-class-uwb\_rc*

If no beacons are received from a device for at least this time, the device will be considered to have gone and it will be removed. The default is 3 superframes (~197 ms) as required by the specification.

**/sys/class/uwb\_rc/uwbN/**

Defined on file *sysfs-class-uwb\_rc*

An individual UWB radio controller.

**/sys/class/uwb\_rc/uwbN/<EUI-48>/**

Defined on file *sysfs-class-uwb\_rc*

A neighbour UWB device that has either been detected as part of a scan or is a member of the radio controllers beacon group.

**/sys/class/uwb\_rc/uwbN/<EUI-48>/BPST**

Defined on file *sysfs-class-uwb\_rc*

The time (using the radio controllers internal 1 ms interval superframe timer) of the last beacon from this device was received.

---

**/sys/class/uwb\_rc/uwbN/<EUI-48>/DevAddr**

Defined on file *sysfs-class-uwb\_rc*

The current DevAddr of this device in colon separated hex octets.

---

**/sys/class/uwb\_rc/uwbN/<EUI-48>/EUI\_48**

Defined on file *sysfs-class-uwb\_rc*

The EUI-48 of this device in colon separated hex octets.

---

**/sys/class/uwb\_rc/uwbN/<EUI-48>/IEs**

Defined on file *sysfs-class-uwb\_rc*

The latest IEs included in this device' s beacon, in space separated hex octets with one IE per line.

---

**/sys/class/uwb\_rc/uwbN/<EUI-48>/LQE**

Defined on file *sysfs-class-uwb\_rc*

Link Quality Estimate - the Signal to Noise Ratio (SNR) of all packets received from this device in dB. This gives an estimate on a suitable PHY rate. Refer to [ECMA-368] section 13.3 for more details.

---

**/sys/class/uwb\_rc/uwbN/<EUI-48>/RSSI**

Defined on file *sysfs-class-uwb\_rc*

Received Signal Strength Indication - the strength of the received signal in dB. LQE is a more useful measure of the radio link quality.

---

**/sys/class/uwb\_rc/uwbN/ASIE**

Defined on file *sysfs-class-uwb\_rc*

The application-specific information element (ASIE) included in this device' s beacon, in space separated hex octets.

Reading returns the current ASIE. Writing replaces the current ASIE with the one written.

---

**/sys/class/uwb\_rc/uwbN/beacon**

Defined on file *sysfs-class-uwb\_rc*

Write:

<channel>

to force a specific channel to be used when beaconing, or, if <channel> is -1, to prohibit beaconing. If <channel> is 0, then the default channel selection algorithm will be used. Valid channels depends on the radio controller's supported band groups.

Reading returns the currently active channel, or -1 if the radio controller is not beaconing.

### **/sys/class/uwb\_rc/uwbN/mac\_address**

Defined on file *sysfs-class-uwb\_rc*

The EUI-48, in colon-separated hex octets, for this radio controller. A write will change the radio controller's EUI-48 but only do so while the device is not beaconing or scanning.

### **/sys/class/uwb\_rc/uwbN/scan**

Defined on file *sysfs-class-uwb\_rc*

Write:

<channel> <type> [<bpst offset>]

to start (or stop) scanning on a channel. <type> is one of:

0	scan
1	scan outside BP
2	scan while inactive
3	scanning disabled
4	scan (with start time of <bpst offset>)

### **/sys/class/uwb\_rc/uwbN/wusbhc**

Defined on file *sysfs-class-uwb\_rc*

A symlink to the device (if any) of the WUSB Host Controller PAL using this radio controller.

### **/sys/class/uwb\_rc/uwbN/wusbhc/wusb\_chid**

Defined on file *sysfs-class-uwb\_rc-wusbhc*

Write the CHID (16 space-separated hex octets) for this host controller. This starts the host controller, allowing it to accept connection from WUSB devices.

Set an all zero CHID to stop the host controller.

---

**/sys/class/uwb\_rc/uwbN/wusbhc/wusb\_dnts**

---

Defined on file *sysfs-class-uwb\_rc-wusbhc*

The device notification time slot (DNTS) count and interval in milliseconds that the WUSB host should use. This controls how often the devices will have the opportunity to send notifications to the host.

---

**/sys/class/uwb\_rc/uwbN/wusbhc/wusb\_phy\_rate**

---

Defined on file *sysfs-class-uwb\_rc-wusbhc*

The maximum PHY rate to use for all connected devices. This is only of limited use for testing and development as the hardware's automatic rate adaptation is better than this simple control.

Refer to [ECMA-368] section 10.3.1.1 for the value to use.

---

**/sys/class/uwb\_rc/uwbN/wusbhc/wusb\_retry\_count**

---

Defined on file *sysfs-class-uwb\_rc-wusbhc*

The number of retries that the WUSB host should attempt before reporting an error for a bus transaction. The range of valid values is [0..15], where 0 indicates infinite retries.

---

**/sys/class/uwb\_rc/uwbN/wusbhc/wusb\_trust\_timeout**

---

Defined on file *sysfs-class-uwb\_rc-wusbhc*

Devices that haven't sent a WUSB packet to the host within 'wusb\_trust\_timeout' ms are considered to have disconnected and are removed. The default value of 4000 ms is the value required by the WUSB specification.

Since this relates to security (specifically, the lifetime of PTKs and GTKs) it should not be changed from the default.

---

**/sys/class/wakeup/**

---

Defined on file *sysfs-class-wakeup*

The */sys/class/wakeup/* directory contains pointers to all wakeup sources in the kernel at that moment in time.

---

**/sys/class/wakeup/…/active\_count**

---

Defined on file *sysfs-class-wakeup*

This file contains the number of times the wakeup source was activated.

### **/sys/class/wakeup/…/active\_time\_ms**

Defined on file *sysfs-class-wakeup*

This file contains the amount of time the wakeup source has been continuously active, in milliseconds. If the wakeup source is not active, this file contains ‘0’ .

### **/sys/class/wakeup/…/event\_count**

Defined on file *sysfs-class-wakeup*

This file contains the number of signaled wakeup events associated with the wakeup source.

### **/sys/class/wakeup/…/expire\_count**

Defined on file *sysfs-class-wakeup*

This file contains the number of times the wakeup source’s timeout has expired.

### **/sys/class/wakeup/…/last\_change\_ms**

Defined on file *sysfs-class-wakeup*

This file contains the monotonic clock time when the wakeup source was touched last time, in milliseconds.

### **/sys/class/wakeup/…/max\_time\_ms**

Defined on file *sysfs-class-wakeup*

This file contains the maximum amount of time this wakeup source has been continuously active, in milliseconds.

### **/sys/class/wakeup/…/name**

Defined on file *sysfs-class-wakeup*

This file contains the name of the wakeup source.

### **/sys/class/wakeup/…/prevent\_suspend\_time\_ms**

Defined on file *sysfs-class-wakeup*

The file contains the total amount of time this wakeup source has been preventing autosleep, in milliseconds.

**/sys/class/wakeup/…/total\_time\_ms**

Defined on file *sysfs-class-wakeup*

This file contains the total amount of time this wakeup source has been active, in milliseconds.

**/sys/class/wakeup/…/wakeup\_count**

Defined on file *sysfs-class-wakeup*

This file contains the number of times the wakeup source might abort suspend.

**/sys/class/watchdog/watchdog1/access\_cs0**

Defined on file *sysfs-class-watchdog*

It is a read/write file. This attribute exists only if the system has booted from the alternate flash chip due to expiration of a watchdog timer of AST2400/AST2500 when alternate boot function was enabled with ‘aspeed,alt-boot’ devicetree option for that watchdog or with an appropriate h/w strapping (for WDT2 only).

At alternate flash the ‘access\_cs0’ sysfs node provides:

**ast2400:**

a way to get access to the primary SPI flash chip at CS0 after booting from the alternate chip at CS1.

**ast2500:**

a way to restore the normal address mapping from (CS0->CS1, CS1->CS0) to (CS0->CS0, CS1->CS1).

Clearing the boot code selection and timeout counter also resets to the initial state the chip select line mapping. When the SoC is in normal mapping state (i.e. booted from CS0), clearing those bits does nothing for both versions of the SoC. For alternate boot mode (booted from CS1 due to wdt2 expiration) the behavior differs as described above.

This option can be used with wdt2 (watchdog1) only.

When read, the current status of the boot code selection is shown. When written with any non-zero value, it clears the boot code selection and the timeout counter, which results in chipselect reset for AST2400/AST2500.

**/sys/class/watchdog/watchdogn/bootstatus**

Defined on file *sysfs-class-watchdog*

It is a read only file. It contains status of the watchdog device at boot. It is equivalent to WDIOC\_GETBOOTSTATUS of ioctl interface.

**/sys/class/watchdog/watchdogn/identity**

Defined on file *sysfs-class-watchdog*

It is a read only file. It contains identity string of watchdog device.

---

### **/sys/class/watchdog/watchdogn/nowayout**

---

Defined on file *sysfs-class-watchdog*

It is a read/write file. While reading, it gives ‘1’ if the device has the nowayout feature set, otherwise it gives ‘0’ . Writing a ‘1’ to the file enables the nowayout feature. Once set, the nowayout feature cannot be disabled, so writing a ‘0’ either has no effect (if the feature was already disabled) or results in a permission error.

---

### **/sys/class/watchdog/watchdogn/pretimeout**

---

Defined on file *sysfs-class-watchdog*

It is a read only file. It specifies the time in seconds before timeout when the pretimeout interrupt is delivered. Pretimeout is an optional feature.

---

### **/sys/class/watchdog/watchdogn/pretimeout\_avaialable\_governors**

---

Defined on file *sysfs-class-watchdog*

It is a read only file. It shows the pretimeout governors available for this watchdog.

---

### **/sys/class/watchdog/watchdogn/pretimeout\_governor**

---

Defined on file *sysfs-class-watchdog*

It is a read/write file. When read, the currently assigned pretimeout governor is returned. When written, it sets the pretimeout governor.

---

### **/sys/class/watchdog/watchdogn/state**

---

Defined on file *sysfs-class-watchdog*

It is a read only file. It gives active/inactive status of watchdog device.

---

### **/sys/class/watchdog/watchdogn/status**

---

Defined on file *sysfs-class-watchdog*

It is a read only file. It contains watchdog device’s internal status bits. It is equivalent to WDIOC\_GETSTATUS of ioctl interface.

---

### **/sys/class/watchdog/watchdogn/timeleft**

---

Defined on file *sysfs-class-watchdog*

It is a read only file. It contains value of time left for reset generation. It is equivalent to WDIOC\_GETTIMELEFT of ioctl interface.

---

**/sys/class/watchdog/watchdogn/timeout**

---

Defined on file *sysfs-class-watchdog*

It is a read only file. It is read to know about current value of timeout programmed.

---

**/sys/class/zram-control/**

---

Defined on file *sysfs-class-zram*

The zram-control/ class sub-directory belongs to zram device class

---

**/sys/class/zram-control/hot\_add**

---

Defined on file *sysfs-class-zram*

RO attribute. Read operation will cause zram to add a new device and return its device id back to user (so one can use /dev/zram<id>), or error code.

---

**/sys/class/zram-control/hot\_remove**

---

Defined on file *sysfs-class-zram*

WO attribute. Remove a specific /dev/zramX device, where X is a device\_id provided by user.

### 5.2.21 Symbols under /sys/dev

---

**/sys/dev**

---

Defined on file *sysfs-dev*

The */sys/dev* tree provides a method to look up the sysfs path for a device using the information returned from stat(2). There are two directories, ‘block’ and ‘char’ , beneath */sys/dev* containing symbolic links with names of the form “<major>:<minor>” . These links point to the corresponding sysfs path for the given device.

Example:

```
$ readlink /sys/dev/block/8:32  
.../block/sdc
```

Entries in /sys/dev/char and /sys/dev/block will be dynamically created and destroyed as devices enter and leave the system.

Users: mdadm <[linux-raid@vger.kernel.org](mailto:linux-raid@vger.kernel.org)>

## 5.2.22 Symbols under /sys/devices

---

### /sys/devices

---

Defined on file *sysfs-devices*

The */sys/devices* tree contains a snapshot of the internal state of the kernel device tree. Devices will be added and removed dynamically as the machine runs, and between different kernel versions, the layout of the devices within this tree will change.

Please do not rely on the format of this tree because of this. If a program wishes to find different things in the tree, please use the */sys/class* structure and rely on the symlinks there to point to the proper location within the */sys/devices* tree of the individual devices. Or rely on the uevent messages to notify programs of devices being added and removed from this tree to find the location of those devices.

Note that sometimes not all devices along the directory chain will have emitted uevent messages, so userspace programs must be able to handle such occurrences.

Users:

udev <linux-hotplug-devel@lists.sourceforge.net>

---

### /sys/devices/\*/<our-device>/fuse

---

Defined on file *sysfs-driver-tegra-fuse*

read-only access to the efuses on Tegra20, Tegra30, Tegra114 and Tegra124 SoC's from NVIDIA. The efuses contain write once data programmed at the factory. The data is layed out in 32bit words in LSB first format. Each bit represents a single value as decoded from the fuse registers. Bits order/assignment exactly matches the HW registers, including any unused bits.

Users: any user space application which wants to read the efuses on Tegra SoC's

---

### /sys/devices/\*/<our-device>/nvmem

---

Defined on file *sysfs-driver-jz4780-efuse*

read-only access to the efuse on the Ingenic JZ4780 SoC. The SoC has a one time programmable 8K efuse that is split into segments. The driver supports read only. The segments are:

0x000	64 bit	Random Number
0x008	128 bit	Ingenic Chip ID
0x018	128 bit	Customer ID
0x028	3520 bit	Reserved
0x1E0	8 bit	Protect Segment
0x1E1	2296 bit	HDMI Key
0x300	2048 bit	Security boot key

Users: any user space application which wants to read the Chip and Customer ID

### /sys/devices/…/consumer:<consumer>

Defined on file *sysfs-devices-consumer*

The /sys/devices/…/consumer:<consumer> are symlinks to device links where this device is the supplier. <consumer> denotes the name of the consumer in that device link and is of the form bus:device name. There can be zero or more of these symlinks for a given device.

### /sys/devices/…/coredump

Defined on file *sysfs-devices-coredump*

The /sys/devices/…/coredump attribute is only present when the device is bound to a driver, which provides the .coredump() callback. The attribute is write only. Anything written to this file will trigger the .coredump() callback.

Available when CONFIG\_DEV\_COREDUMP is enabled.

### /sys/devices/…/firmware\_node/

Defined on file *sysfs-devices-firmware\_node*

The /sys/devices/…/firmware\_node directory contains attributes allowing the user space to check and modify some firmware related properties of given device.

### /sys/devices/…/firmware\_node/description

Defined on file *sysfs-devices-firmware\_node*

The /sys/devices/…/firmware/description attribute contains a string that describes the device as provided by the \_STR method in the ACPI namespace. This attribute is read-only. If the device does not have an \_STR method associated with it in the ACPI namespace, this attribute is not present.

### /sys/devices/…/iommu

Defined on file *sysfs-class-iommu*

IOMMU drivers are able to link the IOMMU for a given device here to allow association of device to IOMMU.

### **/sys/devices/…/lpss\_ltr/**

Defined on file *sysfs-devices-lpss\_ltr*

The /sys/devices/…/lpss\_ltr/ directory is only present for devices included into the Intel Lynxpoint Low Power Subsystem (LPSS). If present, it contains attributes containing the LTR mode and the values of LTR registers of the device.

### **/sys/devices/…/lpss\_ltr/auto\_ltr**

Defined on file *sysfs-devices-lpss\_ltr*

The /sys/devices/…/lpss\_ltr/auto\_ltr attribute contains the current value of the device’s AUTO\_LTR register (raw) represented as an 8-digit hexadecimal number.

This attribute is read-only. If the device’s runtime PM status is not “active”, attempts to read from this attribute cause -EAGAIN to be returned.

### **/sys/devices/…/lpss\_ltr/ltr\_mode**

Defined on file *sysfs-devices-lpss\_ltr*

The /sys/devices/…/lpss\_ltr/ltr\_mode attribute contains an integer number (0 or 1) indicating whether or not the devices’ LTR functionality is working in the software mode (1).

This attribute is read-only. If the device’s runtime PM status is not “active”, attempts to read from this attribute cause -EAGAIN to be returned.

### **/sys/devices/…/lpss\_ltr/sw\_ltr**

Defined on file *sysfs-devices-lpss\_ltr*

The /sys/devices/…/lpss\_ltr/sw\_ltr attribute contains the current value of the device’s SW\_LTR register (raw) represented as an 8-digit hexadecimal number.

This attribute is read-only. If the device’s runtime PM status is not “active”, attempts to read from this attribute cause -EAGAIN to be returned.

### **/sys/devices/…/mmc\_host/mmcX/mmcX:XXXX/enhanced\_area\_offset**

Defined on file *sysfs-devices-mmc*

Enhanced area is a new feature defined in eMMC4.4 standard. eMMC4.4 or later card can support such feature. This kind of area can help to improve the card performance. If the feature is enabled, this attribute will indicate the start address of enhanced data area. If not, this attribute will be -EINVAL. Unit Byte. Format decimal.

**/sys/devices/…/mmc\_host/mmcX/mmcX:XXXX/enhanced\_area\_size**

Defined on file *sysfs-devices-mmc*

Enhanced area is a new feature defined in eMMC4.4 standard. eMMC4.4 or later card can support such feature. This kind of area can help to improve the card performance. If the feature is enabled, this attribute will indicate the size of enhanced data area. If not, this attribute will be -EINVAL. Unit KByte. Format decimal.

**/sys/devices/…/online**

Defined on file *sysfs-devices-online*

The /sys/devices/…/online attribute is only present for devices whose bus types provide .online() and .offline() callbacks. The number read from it (0 or 1) reflects the value of the device’s ‘offline’ field. If that number is 1 and ‘0’ (or ‘n’ , or ‘N’ ) is written to this file, the device bus type’s .offline() callback is executed for the device and (if successful) its ‘offline’ field is updated accordingly. In turn, if that number is 0 and ‘1’ (or ‘y’ , or ‘Y’ ) is written to this file, the device bus type’s .online() callback is executed for the device and (if successful) its ‘offline’ field is updated as appropriate.

After a successful execution of the bus type’s .offline() callback the device cannot be used for any purpose until either it is removed (i.e. device\_del() is called for it), or its bus type’s .online() is exectued successfully.

**/sys/devices/…/power/**

Defined on file *sysfs-devices-power*

The /sys/devices/…/power directory contains attributes allowing the user space to check and modify some power management related properties of given device.

**/sys/devices/…/power/async**

Defined on file *sysfs-devices-power*

The /sys/devices/…/async attribute allows the user space to enable or diasble the device’s suspend and resume callbacks to be executed asynchronously (ie. in separate threads, in parallel with the main suspend/resume thread) during system-wide power transitions (eg. suspend to RAM, hibernation).

All devices have one of the following two values for the power/async file:

- “enabledn” to permit the asynchronous suspend/resume;
- “disabledn” to forbid it;

The value of this attribute may be changed by writing either “enabled” , or “disabled” to it.

It generally is unsafe to permit the asynchronous suspend/resume of a device unless it is certain that all of the PM dependencies of the device are known to the PM core. However, for some devices this attribute is set to “enabled” by bus type code or device drivers and in that cases it should be safe to leave the default value.

### **/sys/devices/…/power/autosuspend\_delay\_ms**

Defined on file *sysfs-devices-power*

The /sys/devices/…/power/autosuspend\_delay\_ms attribute contains the autosuspend delay value (in milliseconds). Some drivers do not want their device to suspend as soon as it becomes idle at run time; they want the device to remain inactive for a certain minimum period of time first. That period is called the autosuspend delay. Negative values will prevent the device from being suspended at run time (similar to writing “on” to the power/control attribute). Values  $\geq 1000$  will cause the autosuspend timer expiration to be rounded up to the nearest second.

Not all drivers support this attribute. If it isn’t supported, attempts to read or write it will yield I/O errors.

### **/sys/devices/…/power/control**

Defined on file *sysfs-devices-power*

The /sys/devices/…/power/control attribute allows the user space to control the run-time power management of the device.

All devices have one of the following two values for the power/control file:

- “auton” to allow the device to be power managed at run time;
- “onn” to prevent the device from being power managed;

The default for all devices is “auto”, which means that they may be subject to automatic power management, depending on their drivers. Changing this attribute to “on” prevents the driver from power managing the device at run time. Doing that while the device is suspended causes it to be woken up.

### **/sys/devices/…/power/pm\_qos\_latency\_tolerance\_us**

Defined on file *sysfs-devices-power*

The /sys/devices/…/power/pm\_qos\_latency\_tolerance\_us attribute contains the PM QoS active state latency tolerance limit for the given device in microseconds. That is the maximum memory access latency the device can suffer without any visible adverse effects on user space functionality. If that value is the string “any”, the latency does not matter to user space at all, but hardware should not be allowed to set the latency tolerance for the device automatically.

Reading “auto” from this file means that the maximum memory access latency for the device may be determined automatically by the hardware as needed. Writing “auto” to it allows the hardware to be switched to this mode if there are no other latency tolerance requirements from the kernel side.

This attribute is only present if the feature controlled by it is supported by the hardware.

This attribute has no effect on runtime suspend and resume of devices and on system-wide suspend/resume and hibernation.

### /sys/devices/…/power/pm\_qos\_no\_power\_off

Defined on file *sysfs-devices-power*

The /sys/devices/…/power/pm\_qos\_no\_power\_off attribute is used for manipulating the PM QoS “no power off” flag. If set, this flag indicates to the kernel that power should not be removed entirely from the device.

Not all drivers support this attribute. If it isn’t supported, it is not present.

This attribute has no effect on system-wide suspend/resume and hibernation.

### /sys/devices/…/power/pm\_qos\_resume\_latency\_us

Defined on file *sysfs-devices-power*

The /sys/devices/…/power/pm\_qos\_resume\_latency\_us attribute contains the PM QoS resume latency limit for the given device, which is the maximum allowed time it can take to resume the device, after it has been suspended at run time, from a resume request to the moment the device will be ready to process I/O, in microseconds. If it is equal to 0, however, this means that the PM QoS resume latency may be arbitrary and the special value “n/a” means that user space cannot accept any resume latency at all for the given device.

Not all drivers support this attribute. If it isn’t supported, it is not present.

This attribute has no effect on system-wide suspend/resume and hibernation.

### /sys/devices/…/power/runtime\_status

Defined on file *sysfs-devices-power*

The /sys/devices/…/power/runtime\_status attribute contains the current runtime PM status of the device, which may be “suspended”, “suspending”, “resuming”, “active”, “error” (fatal error), or “unsupported” (runtime PM is disabled).

### /sys/devices/…/power/wakeup

Defined on file *sysfs-devices-power*

The /sys/devices/…/power/wakeup attribute allows the user space to check if the device is enabled to wake up the system from sleep states, such as the memory sleep state (suspend to RAM) and hibernation (suspend to disk), and to enable or disable it to do that as desired.

Some devices support “wakeup” events, which are hardware signals used to activate the system from a sleep state. Such devices have one of the following two values for the sysfs power/wakeup file:

- “enabledn” to issue the events;
- “disabledn” not to do so;

In that cases the user space can change the setting represented by the contents of this file by writing either “enabled”, or “disabled” to it.

For the devices that are not capable of generating system wakeup events this file is not present. In that case the device cannot be enabled to wake up the system from sleep states.

---

### **/sys/devices/…/power/wakeup\_abort\_count**

---

Defined on file *sysfs-devices-power*

The /sys/devices/…/wakeup\_abort\_count attribute contains the number of times the processing of a wakeup event associated with the device might have aborted system transition into a sleep state in progress. This attribute is read-only. If the device is not capable to wake up the system from sleep states, this attribute is not present. If the device is not enabled to wake up the system from sleep states, this attribute is empty.

---

### **/sys/devices/…/power/wakeup\_active**

---

Defined on file *sysfs-devices-power*

The /sys/devices/…/wakeup\_active attribute contains either 1, or 0, depending on whether or not a wakeup event associated with the device is being processed (1). This attribute is read-only. If the device is not capable to wake up the system from sleep states, this attribute is not present. If the device is not enabled to wake up the system from sleep states, this attribute is empty.

---

### **/sys/devices/…/power/wakeup\_active\_count**

---

Defined on file *sysfs-devices-power*

The /sys/devices/…/wakeup\_active\_count attribute contains the number of times the processing of wakeup events associated with the device was completed (at the kernel level). This attribute is read-only. If the device is not capable to wake up the system from sleep states, this attribute is not present. If the device is not enabled to wake up the system from sleep states, this attribute is empty.

---

### **/sys/devices/…/power/wakeup\_count**

---

Defined on file *sysfs-devices-power*

The `/sys/devices/…/wakeup_count` attribute contains the number of signaled wakeup events associated with the device. This attribute is read-only. If the device is not capable to wake up the system from sleep states, this attribute is not present. If the device is not enabled to wake up the system from sleep states, this attribute is empty.

### **`/sys/devices/…/power/wakeup_expire_count`**

Defined on file *sysfs-devices-power*

The `/sys/devices/…/wakeup_expire_count` attribute contains the number of times a wakeup event associated with the device has been reported with a timeout that expired. This attribute is read-only. If the device is not capable to wake up the system from sleep states, this attribute is not present. If the device is not enabled to wake up the system from sleep states, this attribute is empty.

### **`/sys/devices/…/power/wakeup_last_time_ms`**

Defined on file *sysfs-devices-power*

The `/sys/devices/…/wakeup_last_time_ms` attribute contains the value of the monotonic clock corresponding to the time of signaling the last wakeup event associated with the device, in milliseconds. This attribute is read-only. If the device is not enabled to wake up the system from sleep states, this attribute is not present. If the device is not enabled to wake up the system from sleep states, this attribute is empty.

### **`/sys/devices/…/power/wakeup_max_time_ms`**

Defined on file *sysfs-devices-power*

The `/sys/devices/…/wakeup_max_time_ms` attribute contains the maximum time of processing a single wakeup event associated with the device, in milliseconds. This attribute is read-only. If the device is not capable to wake up the system from sleep states, this attribute is not present. If the device is not enabled to wake up the system from sleep states, this attribute is empty.

### **`/sys/devices/…/power/wakeup_prevent_sleep_time_ms`**

Defined on file *sysfs-devices-power*

The `/sys/devices/…/wakeup_prevent_sleep_time_ms` attribute contains the total time the device has been preventing opportunistic transitions to sleep states from occurring. This attribute is read-only. If the device is not capable to wake up the system from sleep states, this attribute is not present. If the device is not enabled to wake up the system from sleep states, this attribute is empty.

### **`/sys/devices/…/power/wakeup_total_time_ms`**

Defined on file *sysfs-devices-power*

The /sys/devices/…/wakeup\_total\_time\_ms attribute contains the total time of processing wakeup events associated with the device, in milliseconds. This attribute is read-only. If the device is not capable to wake up the system from sleep states, this attribute is not present. If the device is not enabled to wake up the system from sleep states, this attribute is empty.

### **/sys/devices/…/power\_resources\_D0/**

Defined on file *sysfs-devices-power\_resources\_D0*

The /sys/devices/…/power\_resources\_D0/ directory is only present for device objects representing ACPI device nodes that use ACPI power resources for power management.

If present, it contains symbolic links to device directories representing ACPI power resources that need to be turned on for the given device node to be in ACPI power state D0. The names of the links are the same as the names of the directories they point to.

### **/sys/devices/…/power\_resources\_D1/**

Defined on file *sysfs-devices-power\_resources\_D1*

The /sys/devices/…/power\_resources\_D1/ directory is only present for device objects representing ACPI device nodes that use ACPI power resources for power management and support ACPI power state D1.

If present, it contains symbolic links to device directories representing ACPI power resources that need to be turned on for the given device node to be in ACPI power state D1. The names of the links are the same as the names of the directories they point to.

### **/sys/devices/…/power\_resources\_D2/**

Defined on file *sysfs-devices-power\_resources\_D2*

The /sys/devices/…/power\_resources\_D2/ directory is only present for device objects representing ACPI device nodes that use ACPI power resources for power management and support ACPI power state D2.

If present, it contains symbolic links to device directories representing ACPI power resources that need to be turned on for the given device node to be in ACPI power state D2. The names of the links are the same as the names of the directories they point to.

### **/sys/devices/…/power\_resources\_D3hot/**

Defined on file *sysfs-devices-power\_resources\_D3hot*

The `/sys/devices/…/power_resources_D3hot/` directory is only present for device objects representing ACPI device nodes that use ACPI power resources for power management and support ACPI power state D3hot.

If present, it contains symbolic links to device directories representing ACPI power resources that need to be turned on for the given device node to be in ACPI power state D3hot. The names of the links are the same as the names of the directories they point to.

---

**`/sys/devices/…/power_resources_wakeup/`**

Defined on file *sysfs-devices-power\_resources\_wakeup*

The `/sys/devices/…/power_resources_wakeup/` directory is only present for device objects representing ACPI device nodes that require ACPI power resources for wakeup signaling.

If present, it contains symbolic links to device directories representing ACPI power resources that need to be turned on for the given device node to be able to signal wakeup. The names of the links are the same as the names of the directories they point to.

---

**`/sys/devices/…/power_state`**

Defined on file *sysfs-devices-power\_state*

The `/sys/devices/…/power_state` attribute is only present for device objects representing ACPI device nodes that provide power management methods.

If present, it contains a string representing the current ACPI power state of the given device node. Its possible values, “D0”, “D1”, “D2”, “D3hot”, and “D3cold”, reflect the power state names defined by the ACPI specification (ACPI 4 and above).

If the device node uses shared ACPI power resources, this state determines a list of power resources required not to be turned off. However, some power resources needed by the device node in higher-power (lower-number) states may also be ON because of some other devices using them at the moment.

This attribute is read-only.

---

**`/sys/devices/…/real_power_state`**

Defined on file *sysfs-devices-real\_power\_state*

The `/sys/devices/…/real_power_state` attribute is only present for device objects representing ACPI device nodes that provide power management methods and use ACPI power resources for power management.

If present, it contains a string representing the real ACPI power state of the given device node as returned by the \_PSC control method or inferred from the configuration of power resources. Its possible values, “D0”, “D1”, “D2”, “D3hot”

, and “D3cold” , reflect the power state names defined by the ACPI specification (ACPI 4 and above).

In some situations the value of this attribute may be different from the value of the /sys/devices/…/power\_state attribute for the same device object. If that happens, some shared power resources used by the device node are only ON because of some other devices using them at the moment.

This attribute is read-only.

### /sys/devices/…/removable

Defined on file *sysfs-devices-removable*

Information about whether a given device can be removed from the platform by the user. This is determined by its subsystem in a bus / platform-specific way. This attribute is only present for devices that can support determining such information:

“removable” : device can be removed from the platform by the user “fixed” : device is fixed to the platform / cannot be removed

by the user.

“unknown” : The information is unavailable / cannot be deduced.

Currently this is only supported by USB (which infers the information from a combination of hub descriptor bits and platform-specific data such as ACPI).

### /sys/devices/…/resource\_in\_use

Defined on file *sysfs-devices-resource\_in\_use*

The /sys/devices/…/resource\_in\_use attribute is only present for device objects representing ACPI power resources.

If present, it contains a number (0 or 1) representing the current status of the given power resource (0 means that the resource is not in use and therefore it has been turned off).

This attribute is read-only.

### /sys/devices/…/software\_node/

Defined on file *sysfs-devices-software\_node*

This directory contains the details about the device that are assigned in kernel (i.e. software), as opposed to the firmware\_node directory which contains the details that are assigned for the device in firmware. The main attributes in the directory will show the properties the device has, and the relationship it has to some of the other devices.

### /sys/devices/…/state\_synced

Defined on file *sysfs-devices-state\_synced*

The `/sys/devices/…/state_synced` attribute is only present for devices whose bus types or driver provides the `.sync_state()` callback. The number read from it (0 or 1) reflects the value of the device’s ‘`state_synced`’ field. A value of 0 means the `.sync_state()` callback hasn’t been called yet. A value of 1 means the `.sync_state()` callback has been called.

Generally, if a device has `sync_state()` support and has some of the resources it provides enabled at the time the kernel starts (Eg: enabled by hardware reset or bootloader or anything that runs before the kernel starts), then it’ll keep those resources enabled and in a state that’s compatible with the state they were in at the start of the kernel. The device will stop doing this only when the `sync_state()` callback has been called – which happens only when all its consumer devices are registered and have probed successfully. Resources that were left disabled at the time the kernel starts are not affected or limited in any way by `sync_state()` callbacks.

---

### **/sys/devices/…/sun**

---

Defined on file *sysfs-devices-sun*

The file contains a Slot-unique ID which is provided by the `_SUN` method in the ACPI namespace. The value is written in Advanced Configuration and Power Interface Specification as follows:

“The `_SUN` value is required to be unique among the slots of the same type. It is also recommended that this number match the slot number printed on the physical slot whenever possible.”

So reading the sysfs file, we can identify a physical position of the slot in the system.

---

### **/sys/devices/…/supplier:<supplier>**

---

Defined on file *sysfs-devices-supplier*

The `/sys/devices/…/supplier:<supplier>` are symlinks to device links where this device is the consumer. `<supplier>` denotes the name of the supplier in that device link and is of the form bus:device name. There can be zero or more of these symlinks for a given device.

---

### **/sys/devices/…/waiting\_for\_supplier**

---

Defined on file *sysfs-devices-waiting\_for\_supplier*

The `/sys/devices/…/waiting_for_supplier` attribute is only present when `fw_devlink` kernel command line option is enabled and is set to something stricter than “permissive”. It is removed once a device probes successfully (because the information is no longer relevant). The number read from it (0 or 1) reflects whether the device is waiting for one or more suppliers to be added and then linked to using device links before the device can probe.

A value of 0 means the device is not waiting for any suppliers to be added before it can probe. A value of 1 means the device is waiting for one or more suppliers to be added before it can probe.

### **/sys/devices/../../gisb\_arb\_timeout**

Defined on file *sysfs-platform-brcmstb-gisb-arb*

Returns the currently configured raw timeout value of the Broadcom Set Top Box internal GISB bus arbiter. Minimum value is 1, and maximum value is 0xffffffff.

### **/sys/devices/LNXSYSTEM:00/LNXSYBUS:00/TOS620A:00/protection\_level**

Defined on file *sysfs-driver-toshiba\_haps*

This file controls the built-in accelerometer protection level, valid values are:

- 0 -> Disabled
- 1 -> Low
- 2 -> Medium
- 3 -> High

The default protection value is set to 2 (Medium).

Users: KToshiba

### **/sys/devices/LNXSYSTEM:00/LNXSYBUS:00/TOS620A:00/reset\_protection**

Defined on file *sysfs-driver-toshiba\_haps*

This file turns off the built-in accelerometer for a few seconds and then restore normal operation. Accepting 1 as the only parameter.

### **/sys/devices/LNXSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/available\_kbd\_m**

Defined on file *sysfs-driver-toshiba\_acpi*

This file shows the supported keyboard backlight modes the system supports, which can be:

- 0x1 -> FN-Z
- 0x2 -> AUTO (also called TIMER)
- 0x8 -> ON
- 0x10 -> OFF

Note that not all keyboard types support the listed modes. See the entry named "available\_kbd\_modes"

Users: KToshiba

---

**/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/cooling\_method**

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the Cooling Method feature. Reading this file prints two values, the first is the actual cooling method and the second is the maximum cooling method supported. When the maximum cooling method is ONE, valid values are:

- 0 -> Maximum Performance
- 1 -> Battery Optimized

When the maximum cooling method is TWO, valid values are:

- 0 -> Maximum Performance
- 1 -> Performance
- 2 -> Battery Optimized

Users: KToshiba

---

**/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/fan**

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the state of the internal fan, valid values are:

- 0 -> OFF
- 1 -> ON

---

**/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/kbd\_backlight\_1**

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the keyboard backlight operation mode, valid values are:

- 0x1 -> FN-Z
- 0x2 -> AUTO (also called TIMER)
- 0x8 -> ON
- 0x10 -> OFF

Note that from kernel 3.16 onwards this file accepts all listed parameters, kernel 3.15 only accepts the first two (FN-Z and AUTO). Also note that toggling this value on type 1 devices, requires a reboot for changes to take effect.

Users: KToshiba

---

**/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/kbd\_backlight\_1**

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the timeout of the keyboard backlight whenever the operation mode is set to AUTO (or TIMER), valid values range from 0-60. Note that the kernel 3.15 only had support for the first keyboard type, the kernel 3.16 added support for the second type and the range accepted for type 2 is 1-60. See the entry named “kbd\_type”

Users: KToshiba

---

### **/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/kbd\_function\_k**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the Special Functions (hotkeys) operation mode, valid values are:

- 0 -> Normal Operation
- 1 -> Special Functions

In the “Normal Operation” mode, the F{1-12} keys are as usual and the hotkeys are accessed via FN-F{1-12}. In the “Special Functions” mode, the F{1-12} keys trigger the hotkey and the F{1-12} keys are accessed via FN-F{1-12}. Note that toggling this value requires a reboot for changes to take effect.

Users: KToshiba

---

### **/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/kbd\_type**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file shows the current keyboard backlight type, which can be:

- 1 -> Type 1, supporting modes FN-Z and AUTO
- 2 -> Type 2, supporting modes TIMER, ON and OFF

Users: KToshiba

---

### **/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/panel\_power\_on**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls whether the laptop should turn ON whenever the LID is opened, valid values are:

- 0 -> Disabled
- 1 -> Enabled

Note that toggling this value requires a reboot for changes to take effect.

Users: KToshiba

---

### **/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/position**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file shows the absolute position of the built-in accelerometer.

---

**/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/sleep\_functions**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the USB Sleep Functions under battery, and set the level at which point they will be disabled, accepted values can be:

- 0 -> Disabled
- 1-100 -> Battery level to disable sleep functions

Currently it prints two values, the first one indicates if the feature is enabled or disabled, while the second one shows the current battery level set. Note that when the value is set to disabled, the sleep function will only work when connected to power.

Users: KToshiba

---

**/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/touchpad**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the status of the touchpad and pointing stick (if available), valid values are:

- 0 -> OFF
- 1 -> ON

Users: KToshiba

---

**/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/usb\_rapid\_charge**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the USB Rapid Charge state, which can be:

- 0 -> Disabled
- 1 -> Enabled

Note that toggling this value requires a reboot for changes to take effect.

Users: KToshiba

---

**/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/usb\_sleep\_charge**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the USB Sleep & Charge charging mode, which can be:

- 0 -> Disabled (0x00)
- 1 -> Alternate (0x09)

- 2 -> Auto (0x21)
- 3 -> Typical (0x11)

Note that from kernel 4.1 onwards this file accepts all listed values, kernel 4.0 only supports the first three. Note that this feature only works when connected to power, if you want to use it under battery, see the entry named “sleep\_functions\_on\_battery”

Users: KToshiba

---

### **/sys/devices/LNXSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/usb\_sleep\_music**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the Sleep & Music state, which values can be:

- 0 -> Disabled
- 1 -> Enabled

Note that this feature only works when connected to power, if you want to use it under battery, see the entry named “sleep\_functions\_on\_battery”

Users: KToshiba

---

### **/sys/devices/LNXSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/usb\_three**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file controls the USB 3 functionality, valid values are:

- 0 -> Disabled (Acts as a regular USB 2)
- 1 -> Enabled (Full USB 3 functionality)

Note that toggling this value requires a reboot for changes to take effect.

Users: KToshiba

---

### **/sys/devices/LNXSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/version**

---

Defined on file *sysfs-driver-toshiba\_acpi*

This file shows the current version of the driver

Users: KToshiba

---

### **/sys/devices/cpu/events/**

---

Defined on file *sysfs-bus-event\_source-devices-events*

Generic performance monitoring events

A collection of performance monitoring events that may be supported by many/most CPUs. These events can be monitored using the ‘perf(1)’ tool.

The contents of each file would look like:

```
event=0xNNNN
```

where ‘N’ is a hex digit and the number ‘0xNNNN’ shows the “raw code” for the perf event identified by the file’s “basename” .

---

**/sys/devices/hv\_24x7/cpumask**

Defined on file *sysfs-bus-event\_source-devices-hv\_24x7*

read only This sysfs file exposes the cpumask which is designated to make HCALS to retrieve hv-24x7 pmu event counter data.

---

**/sys/devices/hv\_24x7/interface/chipspersocket**

Defined on file *sysfs-bus-event\_source-devices-hv\_24x7*

read only This sysfs interface exposes the number of chips per socket present in the system.

---

**/sys/devices/hv\_24x7/interface/coresperchip**

Defined on file *sysfs-bus-event\_source-devices-hv\_24x7*

read only This sysfs interface exposes the number of cores per chip present in the system.

---

**/sys/devices/hv\_24x7/interface/sockets**

Defined on file *sysfs-bus-event\_source-devices-hv\_24x7*

read only This sysfs interface exposes the number of sockets present in the system.

---

**/sys/devices/hv\_gpci/cpumask**

Defined on file *sysfs-bus-event\_source-devices-hv\_gpci*

read only This sysfs file exposes the cpumask which is designated to make HCALS to retrieve hv-gpci pmu event counter data.

---

**/sys/devices/pci0000:00/<dev>/fw\_info**

Defined on file *sysfs-bus-pci-devices-catpt*

Detailed AudioDSP firmware build information including build hash and log-providers hash. This information is obtained during initial handshake with firmware. Format: %s.

### **/sys/devices/pci0000:00/<dev>/fw\_version**

Defined on file *sysfs-bus-pci-devices-catpt*

Version of AudioDSP firmware ASoC catpt driver is communicating with.

Format: %d.%d.%d.%d, type:major:minor:build.

### **/sys/devices/platform/8086%0:00/firmware\_version**

Defined on file *sysfs-platform-sst-atom*

LPE Firmware version for SST driver on all atom platforms (BYT/CHT/Merrifield/BSW). If the FW has never been loaded it will display:

"FW not yet loaded"

If FW has been loaded it will display:

"v01.aa.bb.cc"

aa: Major version is reflecting SoC version:

0d:	BYT FW
0b:	BSW FW
07:	Merrifield FW

bb: Minor version

cc: Build version

### **/sys/devices/platform/<i2c-demux-name>/available\_masters**

Defined on file *sysfs-platform-i2c-demux-pinctrl*

Reading the file will give you a list of masters which can be selected for a demultiplexed bus. The format is "<index>:<name>" . Example from a Renesas Lager board:

0:/i2c@e6500000 1:/i2c@e6508000

### **/sys/devices/platform/<i2c-demux-name>/current\_master**

Defined on file *sysfs-platform-i2c-demux-pinctrl*

This file selects/shows the active I2C master for a demultiplexed bus. It uses the <index> value from the file 'available\_masters' .

### **/sys/devices/platform/<phy-name>/role**

Defined on file [\*sysfs-platform-phy-rkar-gen3-usb2\*](#)

This file can be read and write. The file can show/change the phy mode for role swap of usb.

Write the following strings to change the mode:

- “host” - switching mode from peripheral to host.
- “peripheral” - switching mode from host to peripheral.

Read the file, then it shows the following strings:

- “host” - The mode is host now.
- “peripheral” - The mode is peripheral now.

---

**/sys/devices/platform/<platform>/camera**

---

Defined on file [\*sysfs-platform-asus-wmi\*](#)

Control the camera. 1 means on, 0 means off.

---

**/sys/devices/platform/<platform>/cardr**

---

Defined on file [\*sysfs-platform-asus-wmi\*](#)

Control the card reader. 1 means on, 0 means off.

---

**/sys/devices/platform/<platform>/cpufv**

---

Defined on file [\*sysfs-platform-asus-wmi\*](#)

Change CPU clock configuration (write-only). There are three available clock configuration:

- 0 -> Super Performance Mode
- 1 -> High Performance Mode
- 2 -> Power Saving Mode

---

**/sys/devices/platform/<platform>/dgpu\_disable**

---

Defined on file [\*sysfs-platform-asus-wmi\*](#)

### **Disable discrete GPU:**

- 0 - Enable dGPU,
- 1 - Disable dGPU

---

**/sys/devices/platform/<platform>/fan\_boost\_mode**

---

Defined on file [\*sysfs-platform-asus-wmi\*](#)

### Fan boost mode:

- 0 - normal,
- 1 - overboost,
- 2 - silent

---

**/sys/devices/platform/<platform>/force\_power**

---

Defined on file *sysfs-platform-intel-wmi-thunderbolt*

Modify the platform force power state, influencing Thunderbolt controllers to turn on or off when no devices are connected (write-only) There are two available states:

- 0 -> Force power disabled
- 1 -> Force power enabled

---

**/sys/devices/platform/<platform>/lid\_resume**

---

Defined on file *sysfs-platform-asus-wmi*

Resume on lid open. 1 means on, 0 means off.

---

**/sys/devices/platform/<platform>/throttle\_thermal\_policy**

---

Defined on file *sysfs-platform-asus-wmi*

### Throttle thermal policy mode:

- 0 - default,
- 1 - overboost,
- 2 - silent

---

**/sys/devices/platform/<platform>/tokens/\***

---

Defined on file *sysfs-platform-dell-smbios*

A read-only description of Dell platform tokens available on the machine.

Each token attribute is available as a pair of sysfs attributes readable by a process with CAP\_SYS\_ADMIN.

For example the token ID “5” would be available as the following attributes:

- 0005\_location
- 0005\_value

Tokens will vary from machine to machine, and only tokens available on that machine will be displayed.

---

**/sys/devices/platform/<platform>/touchpad**

---

Defined on file *sysfs-platform-asus-wmi*

Control the card touchpad. 1 means on, 0 means off.

---

### **/sys/devices/platform/<renesas\_usb3' s name>/role**

---

Defined on file *sysfs-platform-renesas\_usb3*

This file can be read and write. The file can show/change the drd mode of usb.

Write the following string to change the mode:

- “host” - switching mode from peripheral to host.
- “peripheral” - switching mode from host to peripheral.

Read the file, then it shows the following strings:

- “host” - The mode is host now.
- “peripheral” - The mode is peripheral now.

---

### **/sys/devices/platform/\_UDC\_/gadget/gadget-lunX/nofua**

---

Defined on file *sysfs-devices-platform-\_UDC\_-gadget*

Show or set the reaction on the FUA (Force Unit Access) bit in the SCSI WRITE(10,12) commands when a gadget in USB Mass Storage mode.

Possible values are:

- 1 -> ignore the FUA flag
- 0 -> obey the FUA flag

---

### **/sys/devices/platform/\_UDC\_/gadget/suspended**

---

Defined on file *sysfs-devices-platform-\_UDC\_-gadget*

Show the suspend state of an USB composite gadget.

- 1 -> suspended
- 0 -> resumed

(\_UDC\_ is the name of the USB Device Controller driver)

---

### **/sys/devices/platform/asus\_laptop/bluetooth**

---

Defined on file *sysfs-platform-asus-laptop*

Control the bluetooth device. 1 means on, 0 means off. This may control the led, the device or both.

Users: Lapsus

### **/sys/devices/platform/asus\_laptop/display**

Defined on file *sysfs-platform-asus-laptop*

This file allows display switching. The value is composed by 4 bits and defined as follow:

```
4321  
|||`- LCD  
||`-- CRT  
|`--- TV  
`---- DVI
```

**Ex:**

- 0 (0000b) means no display
- 3 (0011b) CRT+LCD.

### **/sys/devices/platform/asus\_laptop/gps**

Defined on file *sysfs-platform-asus-laptop*

Control the gps device. 1 means on, 0 means off.

Users: Lapsus

### **/sys/devices/platform/asus\_laptop/ledd**

Defined on file *sysfs-platform-asus-laptop*

Some models like the W1N have a LED display that can be used to display several items of information. To control the LED display, use the following:

```
echo 0x0T000DDD > /sys/devices/platform/asus_laptop/
```

where T control the 3 letters display, and DDD the 3 digits display. The DDD table can be found in *Asus Laptop Extras*

### **/sys/devices/platform/asus\_laptop/wimax**

Defined on file *sysfs-platform-asus-laptop*

Control the wimax device. 1 means on, 0 means off.

### **/sys/devices/platform/asus\_laptop/wlan**

Defined on file *sysfs-platform-asus-laptop*

Control the wlan device. 1 means on, 0 means off. This may control the led, the device or both.

Users: Lapsus

### **/sys/devices/platform/asus\_laptop/wwan**

Defined on file *sysfs-platform-asus-laptop*

Control the wwan (3G) device. 1 means on, 0 means off.

### **/sys/devices/platform/at91\_can/net/<iface>/mb0\_id**

Defined on file *sysfs-platform-at91*

Value representing the can\_id of mailbox 0.

Default: 0x7ff (standard frame)

Due to a chip bug (errata 50.2.6.3 & 50.3.5.3 in “AT91SAM9263 Preliminary 6249H-ATARM-27-Jul-09” ) the contents of mailbox 0 may be send under certain conditions (even if disabled or in rx mode).

The workaround in the errata suggests not to use the mailbox and load it with an unused identifier.

In order to use an extended can\_id add the CAN\_EFF\_FLAG (0x80000000U) to the can\_id. Example:

- standard id 0x7ff:

```
echo 0x7ff      > /sys/class/net/can0/mb0_id
```

- extended id 0x1fffffff:

```
echo 0x9fffffff > /sys/class/net/can0/mb0_id
```

### **/sys/devices/platform/dmi-ipmi-ssif.\*/hosed /sys/devices/platform/dmi-ipmi-ssif.\*/alerts /sys/devices/platform/dmi-ipmi-ssif.\*/sent\_messages /sys/devices/platform/dmi-ipmi-ssif.\*/sent\_messages\_parts /sys/devices/platform/dmi-ipmi-ssif.\*/received\_messages /sys/devices/platform/dmi-ipmi-ssif.\*/received\_message\_parts /sys/devices/platform/dmi-ipmi-ssif.\*/events /sys/devices/platform/dmi-ipmi-ssif.\*/watchdog\_pretimeouts /sys/devices/platform/dmi-ipmi-ssif.\*/flag\_fetches /sys/devices/platform/dmi-ipmi-ssif.\*/send\_retries /sys/devices/platform/dmi-ipmi-ssif.\*/receive\_retries /sys/devices/platform/dmi-ipmi-ssif.\*/send\_errors /sys/devices/platform/dmi-ipmi-ssif.\*/receive\_errors**

Defined on file *sysfs-devices-platform-ipmi*

hosed	(RO) Number of times the hardware didn't follow the state machine.
alerts	(RO) Number of alerts received.
sent_messages	(RO) Number of total messages sent.
sent_message_parts	(RO) Number of message parts sent. Messages may be broken into parts if they are long.
received_messages	(RO) Number of message responses received.
received_message_fragments	(RO) Number of message fragments received.
events	(RO) Number of received events.
watchdog_pretimeouts	(RO) Number of watchdog pretimeouts.
flag_fetches	(RO) Number of times a flag fetch was requested.
send_retries	(RO) Number of times a message was retried.
receive_retries	(RO) Number of times the receive of a message was retried.
send_errors	(RO) Number of times the send of a message failed.
receive_errors	(RO) Number of errors in receiving messages.

### /sys/devices/platform/dmi-ipmi-ssif.\*/type

Defined on file *sysfs-devices-platform-ipmi*

(RO) Shows the IMPI device interface type - “ssif” here.

### /sys/devices/platform/docg3/f[0-3]\_dps[01]\_is\_keylocked

Defined on file *sysfs-devices-platform-docg3*

Show whether the floor (0 to 4), protection area (0 or 1) is keylocked. Each docg3 chip (or floor) has 2 protection areas, which can cover any part of it, block aligned, called DPS. The protection has information embedded whether it blocks reads, writes or both. The result is:

- 0 -> the DPS is not keylocked
- 1 -> the DPS is keylocked

Users: None identified so far.

### /sys/devices/platform/docg3/f[0-3]\_dps[01]\_protection\_key

Defined on file *sysfs-devices-platform-docg3*

Enter the protection key for the floor (0 to 4), protection area (0 or 1). Each docg3 chip (or floor) has 2 protection areas, which can cover any part of it, block aligned, called DPS. The protection has information embedded whether it blocks reads, writes or both. The protection key is a string of 8 bytes (value 0-255). Entering the correct value toggle the lock, and can be observed through f[0-3]\_dps[01]\_is\_keylocked. Possible values are:

- 8 bytes

Typical values are:

- “00000000”
- “12345678”

Users: None identified so far.

---

### **/sys/devices/platform/dock.N/docked**

---

Defined on file *sysfs-devices-platform-dock*

(RO) Value 1 or 0 indicates whether the software believes the laptop is docked in a docking station.

---

### **/sys/devices/platform/dock.N/flags**

---

Defined on file *sysfs-devices-platform-dock*

(RO) Show dock station flags, useful for checking if undock request has been made by the user (from the immediate\_undock option).

---

### **/sys/devices/platform/dock.N/type**

---

Defined on file *sysfs-devices-platform-dock*

(RO) Display the dock station type- dock\_station, ata\_bay or battery\_bay.

---

### **/sys/devices/platform/dock.N/uid**

---

Defined on file *sysfs-devices-platform-dock*

(RO) Displays the docking station the laptop is docked to.

---

### **/sys/devices/platform/dock.N/undock**

---

Defined on file *sysfs-devices-platform-dock*

(WO) Writing to this file causes the software to initiate an undock request to the firmware.

---

### **/sys/devices/platform/eepc/available\_cpufv**

---

Defined on file *sysfs-platform-eepc-laptop*

List available cpufv modes.

---

### **/sys/devices/platform/eepc/camera**

---

Defined on file *sysfs-platform-eepc-laptop*

Control the camera. 1 means on, 0 means off.

---

### /sys/devices/platform/eepc/cardr

---

Defined on file *sysfs-platform-eepc-laptop*

Control the card reader. 1 means on, 0 means off.

---

### /sys/devices/platform/eepc/cpufv

---

Defined on file *sysfs-platform-eepc-laptop*

Change CPU clock configuration. On the Eee PC 1000H there are three available clock configuration:

- 0 -> Super Performance Mode
- 1 -> High Performance Mode
- 2 -> Power Saving Mode

On Eee PC 701 there is only 2 available clock configurations. Available configuration are listed in `available_cpufv` file. Reading this file will show the raw hexadecimal value which is defined as follow:

	8 bit		8 bit	
		`-----	Current mode	
		-----	Avalables modes	

For example, 0x301 means: mode 1 selected, 3 available modes.

---

### /sys/devices/platform/eepc/disp

---

Defined on file *sysfs-platform-eepc-laptop*

This file allows display switching.

- 1 = LCD
- 2 = CRT
- 3 = LCD+CRT

If you run X11, you should use `xrandr` instead.

---

### /sys/devices/platform/hidma-\*/chid

---

Defined on file *sysfs-platform-hidma*

Contains the ID of the channel within the HIDMA instance. It is used to associate a given HIDMA channel with the priority and weight calls in the management interface.

---

### **/sys/devices/platform/hidma-mgmt\*/chanops/chan\*/priority**

---

Defined on file *sysfs-platform-hidma-mgmt*

Contains either 0 or 1 and indicates if the DMA channel is a low priority (0) or high priority (1) channel.

---

### **/sys/devices/platform/hidma-mgmt\*/chanops/chan\*/weight**

---

Defined on file *sysfs-platform-hidma-mgmt*

Contains 0..15 and indicates the weight of the channel among equal priority channels during round robin scheduling.

---

### **/sys/devices/platform/hidma-mgmt\*/chreset\_timeout\_cycles**

---

Defined on file *sysfs-platform-hidma-mgmt*

Contains the platform specific cycle value to wait after a reset command is issued. If the value is chosen too short, then the HW will issue a reset failure interrupt. The value is platform specific and should not be changed without consultance.

---

### **/sys/devices/platform/hidma-mgmt\*/dma\_channels**

---

Defined on file *sysfs-platform-hidma-mgmt*

Contains the number of dma channels supported by one instance of HIDMA hardware. The value may change from chip to chip.

---

### **/sys/devices/platform/hidma-mgmt\*/hw\_version\_major**

---

Defined on file *sysfs-platform-hidma-mgmt*

Version number major for the hardware.

---

### **/sys/devices/platform/hidma-mgmt\*/hw\_version\_minor**

---

Defined on file *sysfs-platform-hidma-mgmt*

Version number minor for the hardware.

---

### **/sys/devices/platform/hidma-mgmt\*/max\_rd\_xactions**

---

Defined on file *sysfs-platform-hidma-mgmt*

Contains a value between 0 and 31. Maximum number of read transactions that can be issued back to back. Choosing a higher number gives better performance

but can also cause performance reduction to other peripherals sharing the same bus.

### **/sys/devices/platform/hidma-mgmt\*/max\_read\_request**

Defined on file *sysfs-platform-hidma-mgmt*

Size of each read request. The value needs to be a power of two and can be between 128 and 1024.

### **/sys/devices/platform/hidma-mgmt\*/max\_wr\_xactions**

Defined on file *sysfs-platform-hidma-mgmt*

Contains a value between 0 and 31. Maximum number of write transactions that can be issued back to back. Choosing a higher number gives better performance but can also cause performance reduction to other peripherals sharing the same bus.

### **/sys/devices/platform/hidma-mgmt\*/max\_write\_request**

Defined on file *sysfs-platform-hidma-mgmt*

Size of each write request. The value needs to be a power of two and can be between 128 and 1024.

### **/sys/devices/platform/i8042/…/draghys**

Defined on file *sysfs-devices-platform-trackpoint*

(RW) The drag hysteresis controls how hard it is to drag with z-axis pressed.

### **/sys/devices/platform/i8042/…/drift\_time**

Defined on file *sysfs-devices-platform-trackpoint*

(RW) This parameter controls the period of time to test for a ‘hands off’ condition (i.e. when no force is applied) before a drift (noise) calibration occurs.

IBM Trackpoints have a feature to compensate for drift by recalibrating themselves periodically. By default, if for 0.5 seconds there is no change in position, it’s used as the new zero. This duration is too low. Often, the calibration happens when the trackpoint is in fact being used.

### **/sys/devices/platform/i8042/…/ext\_dev**

Defined on file *sysfs-devices-platform-trackpoint*

(RW) Disable (0) or enable (1) external pointing device.

---

### **/sys/devices/platform/i8042/…/intertia**

---

Defined on file *sysfs-devices-platform-trackpoint*

(RW) Negative inertia factor. High values cause the cursor to snap backward when the trackpoint is released.

---

### **/sys/devices/platform/i8042/…/jenks**

---

Defined on file *sysfs-devices-platform-trackpoint*

(RW) Minimum curvature in degrees required to generate a double click without a release.

---

### **/sys/devices/platform/i8042/…/mindrag**

---

Defined on file *sysfs-devices-platform-trackpoint*

(RW) Minimum amount of force needed to trigger dragging.

---

### **/sys/devices/platform/i8042/…/press\_to\_select**

---

Defined on file *sysfs-devices-platform-trackpoint*

(RW) Writing a value of 1 to this file will enable the Press to Select functions like tapping the control stick to simulate a left click, and writing 0 will disable it.

---

### **/sys/devices/platform/i8042/…/reach**

---

Defined on file *sysfs-devices-platform-trackpoint*

(RW) Backup range for z-axis press.

---

### **/sys/devices/platform/i8042/…/sensitivity**

---

Defined on file *sysfs-devices-platform-trackpoint*

(RW) Trackpoint sensitivity.

---

### **/sys/devices/platform/i8042/…/skipback**

---

Defined on file *sysfs-devices-platform-trackpoint*

(RW) When the skipback bit is set, backup cursor movement during releases from drags will be suppressed. The default value for this bit is 0.

---

### **/sys/devices/platform/i8042/…/speed**

---

Defined on file *sysfs-devices-platform-trackpoint*

(RW) Speed of the trackpoint cursor.

### **/sys/devices/platform/i8042/…/thresh**

Defined on file *sysfs-devices-platform-trackpoint*

(RW) Minimum value for z-axis force required to trigger a press or release, relative to the running average.

### **/sys/devices/platform/i8042/…/upthresh**

Defined on file *sysfs-devices-platform-trackpoint*

(RW) The offset from the running average required to generate a select (click) on z-axis on release.

### **/sys/devices/platform/i8042/…/ztime**

Defined on file *sysfs-devices-platform-trackpoint*

(RW) This attribute determines how sharp a press has to be in order to be recognized.

### **/sys/devices/platform/ideapad/camera\_power**

Defined on file *sysfs-platform-ideapad-laptop*

Control the power of camera module. 1 means on, 0 means off.

### **/sys/devices/platform/ideapad/fan\_mode**

Defined on file *sysfs-platform-ideapad-laptop*

Change fan mode There are four available modes:

- 0 -> Super Silent Mode
- 1 -> Standard Mode
- 2 -> Dust Cleaning
- 4 -> Efficient Thermal Dissipation Mode

### **/sys/devices/platform/ideapad/touchpad**

Defined on file *sysfs-platform-ideapad-laptop*

**Control touchpad mode.**

- 1 -> Switched On

- 0 -> Switched Off

---

**/sys/devices/platform/ipmi\_bmc.\*/additional\_device\_support**

Defined on file *sysfs-devices-platform-ipmi*

(RO) Lists the IPMI ‘logical device’ commands and functions that the controller supports that are in addition to the mandatory IPM and Application commands.

---

**/sys/devices/platform/ipmi\_bmc.\*/aux\_firmware\_revision**

Defined on file *sysfs-devices-platform-ipmi*

(RO) Holds additional information about the firmware revision, such as boot block or internal data structure version numbers. The meanings of the numbers are specific to the vendor identified by Manufacturer ID.

---

**/sys/devices/platform/ipmi\_bmc.\*/device\_id**

Defined on file *sysfs-devices-platform-ipmi*

(RO) Device id is specified by the manufacturer identified by the Manufacturer ID field. This field allows controller specific software to identify the unique application command, OEM fields, and functionality that are provided by the controller

---

**/sys/devices/platform/ipmi\_bmc.\*/firmware\_revision**

Defined on file *sysfs-devices-platform-ipmi*

(RO) The major and minor revision of the firmware.

---

**/sys/devices/platform/ipmi\_bmc.\*/guid**

Defined on file *sysfs-devices-platform-ipmi*

(RO) A GUID (Globally Unique ID), also referred to as a UUID (Universally Unique Identifier), for the management controller, as described in section 20.8 ‘Get Device GUID Command’ of the IPMI specification v2.0.

---

**/sys/devices/platform/ipmi\_bmc.\*/ipmi\_version**

Defined on file *sysfs-devices-platform-ipmi*

(RO) Displays the IPMI Command Specification Version.

---

**/sys/devices/platform/ipmi\_bmc.\*/manufacturer\_id**

Defined on file *sysfs-devices-platform-ipmi*

(RO) Identifies the manufacturer responsible for the specification of functionality of the vendor (OEM)-specific commands, codes, and interfaces used in the controller.

### **/sys/devices/platform/ipmi\_bmc.\*/product\_id**

Defined on file *sysfs-devices-platform-ipmi*

(RO) Displays a number that identifies a particular system, module, add-in card, or board set. The number is specified according to the manufacturer given by Manufacturer ID.

For detailed definitions of the above attributes, refer to section 20.1 ‘Get Device ID Command’ of the IPMI specification v2.0.

### **/sys/devices/platform/ipmi\_bmc.\*/provides\_device\_sdrs**

Defined on file *sysfs-devices-platform-ipmi*

(RO) Indicates whether device provides device sensor data records (1) or not (0).

### **/sys/devices/platform/ipmi\_bmc.\*/revision**

Defined on file *sysfs-devices-platform-ipmi*

(RO) Device revision. Useful for identifying if significant hardware changes have been made to the implementation of the management controller.

```
/sys/devices/platform/ipmi_si.*/idles
/sys/devices/platform/ipmi_si.*/watchdog_pretimeouts
/sys/devices/platform/ipmi_si.*/complete_transactions
/sys/devices/platform/ipmi_si.*/events
/sys/devices/platform/ipmi_si.*/interrupts
/sys/devices/platform/ipmi_si.*/hosed_count
/sys/devices/platform/ipmi_si.*/long_timeouts
/sys/devices/platform/ipmi_si.*/flag_fetches
/sys/devices/platform/ipmi_si.*/attentions
/sys/devices/platform/ipmi_si.*/incoming_messages
/sys/devices/platform/ipmi_si.*/short_timeouts
```

Defined on file *sysfs-devices-platform-ipmi*

idles	(RO) Number of times the interface was idle while being polled.
watch-dog_pretimeouts	(RO) Number of watchdog pretimeouts.
complete_transaction	(RO) Number of completed messages.
events	(RO) Number of IPMI events received from the hardware.
interrupts	(RO) Number of interrupts the driver handled.
hosed_count	(RO) Number of times the hardware didn't follow the state machine.
long_timeouts	(RO) Number of times the driver requested a timer while nothing was in progress.
flag_fetches	(RO) Number of times the driver requested flags from the hardware.
attentions	(RO) Number of time the driver got an ATTN from the hardware.
incoming_messages	(RO) Number of asynchronous messages received.
short_timeouts	(RO) Number of times the driver requested a timer while an operation was in progress.

**/sys/devices/platform/ipmi\_si.\*/interrupts\_enabled**

Defined on file *sysfs-devices-platform-ipmi*

(RO) Indicates whether interrupts are enabled or not. The driver disables interrupts when it gets into a situation where it cannot handle messages due to lack of memory. Once that situation clears up, it will re-enable interrupts.

**/sys/devices/platform/ipmi\_si.\*/params**

Defined on file *sysfs-devices-platform-ipmi*

[to be documented]

**/sys/devices/platform/ipmi\_si.\*/type**

Defined on file *sysfs-devices-platform-ipmi*

(RO) The device interface for IPMI “kcs” , “smic” , “bt” or “invalid”

**/sys/devices/platform/kim/baud\_rate**

Defined on file *sysfs-platform-kim*

The maximum reliable baud-rate the host can support. Different platforms tend to have different high-speed UART configurations, so the baud-rate needs to be set

locally and also sent across to the WL128x via a HCI-VS command. The entry is read and made use by the user-space daemon when the ldisc install is requested.

### **/sys/devices/platform/kim/dev\_name**

Defined on file *sysfs-platform-kim*

Name of the UART device at which the WL128x chip is connected. example: “/dev/ttyS0” .

The device name flows down to architecture specific board initialization file from the SFI/ATAGS bootloader firmware. The name exposed is read from the user-space dameon and opens the device when install is requested.

### **/sys/devices/platform/kim/flow\_cntrl**

Defined on file *sysfs-platform-kim*

The WL128x makes use of flow control mechanism, and this entry most often should be 1, the host’ s UART is required to have the capability of flow-control, or else this entry can be made use of for exceptions.

### **/sys/devices/platform/kim/install**

Defined on file *sysfs-platform-kim*

When one of the protocols Bluetooth, FM or GPS wants to make use of the shared UART transport, it registers to the shared transport driver, which will signal the user-space for opening, configuring baud and install line discipline via this sysfs entry. This entry would be polled upon by the user-space daemon managing the UART, and is notified about the change by the sysfs\_notify. The value would be ‘1’ when UART needs to be opened/lisc installed, and would be ‘0’ when UART is no more required and needs to be closed.

### **/sys/devices/platform/lg-laptop/battery\_care\_limit**

Defined on file *sysfs-platform-lg-laptop*

Maximal battery charge level. Accepted values are 80 or 100.

### **/sys/devices/platform/lg-laptop/fan\_mode**

Defined on file *sysfs-platform-lg-laptop*

Control fan mode. 1 for performance mode, 0 for silent mode.

### **/sys/devices/platform/lg-laptop/fn\_lock**

Defined on file *sysfs-platform-lg-laptop*

Control FN lock mode. 1 means on, 0 means off.

---

### **/sys/devices/platform/lg-laptop/reader\_mode**

---

Defined on file *sysfs-platform-lg-laptop*

Control reader mode. 1 means on, 0 means off.

---

### **/sys/devices/platform/lg-laptop/usb\_charge**

---

Defined on file *sysfs-platform-lg-laptop*

Control USB port charging when device is turned off. 1 means on, 0 means off.

---

### **/sys/devices/platform/msi-laptop-pf/auto\_brightness**

---

Defined on file *sysfs-platform-msi-laptop*

Enable automatic brightness control: contains either 0 or 1. If set to 1 the hardware adjusts the screen brightness automatically when the power cord is plugged/unplugged.

---

### **/sys/devices/platform/msi-laptop-pf/auto\_fan**

---

Defined on file *sysfs-platform-msi-laptop*

Contains either 0 or 1 and indicates if fan speed is controlled automatically (1) or fan runs at maximal speed (0). Can be toggled in software.

---

### **/sys/devices/platform/msi-laptop-pf/bluetooth**

---

Defined on file *sysfs-platform-msi-laptop*

Bluetooth subsystem enabled: contains either 0 or 1. Please note that this file is constantly 0 if no Bluetooth hardware is available.

---

### **/sys/devices/platform/msi-laptop-pf/eco\_mode**

---

Defined on file *sysfs-platform-msi-laptop*

Contains either 0 or 1 and indicates if ECO mode is turned on. In ECO mode power LED is green and userspace should do some powersaving actions. ECO mode is available only on battery power. ECO mode can only be toggled by pressing Fn+F10.

---

### **/sys/devices/platform/msi-laptop-pf/lcd\_level**

---

Defined on file *sysfs-platform-msi-laptop*

Screen brightness: contains a single integer in the range 0..8.

### **/sys/devices/platform/msi-laptop-pf/touchpad**

Defined on file *sysfs-platform-msi-laptop*

Contains either 0 or 1 and indicates if touchpad is turned on. Touchpad state can only be toggled by pressing Fn+F3.

### **/sys/devices/platform/msi-laptop-pf/turbo\_coldown**

Defined on file *sysfs-platform-msi-laptop*

**Contains value in range 0..3:**

- 0 -> Turbo mode is off
- 1 -> Turbo mode is on, cannot be turned off yet
- 2 -> Turbo mode is off, cannot be turned on yet
- 3 -> Turbo mode is on

### **/sys/devices/platform/msi-laptop-pf/turbo\_mode**

Defined on file *sysfs-platform-msi-laptop*

Contains either 0 or 1 and indicates if turbo mode is turned on. In turbo mode power LED is orange and processor is overclocked. Turbo mode is available only if charging. It is only possible to toggle turbo mode state by pressing Fn+F10, and there is a few seconds cooldown between subsequent toggles. If user presses Fn+F10 too frequent, turbo mode state is not changed.

### **/sys/devices/platform/msi-laptop-pf/wlan**

Defined on file *sysfs-platform-msi-laptop*

WLAN subsystem enabled: contains either 0 or 1.

### **/sys/devices/platform/samsung/battery\_life\_extender**

Defined on file *sysfs-driver-samsung-laptop*

Max battery charge level can be modified, battery cycle life can be extended by reducing the max battery charge level.

- 0 means normal battery mode (100% charge)
- 1 means battery life extender mode (80% charge)

### **/sys/devices/platform/samsung/lid\_handling**

Defined on file *sysfs-driver-samsung-laptop*

Some Samsung laptops handle lid closing quicker and only handle lid opening with this mode enabled. 1 means enabled, 0 means disabled.

### **/sys/devices/platform/samsung/performance\_level**

Defined on file *sysfs-driver-samsung-laptop*

Some Samsung laptops have different “performance levels” that can be modified by a function key, and by this sysfs file. These values don’t always make a whole lot of sense, but some users like to modify them to keep their fans quiet at all costs. Reading from this file will show the current performance level. Writing to the file can change this value.

#### **Valid options:**

- “silent”
- “normal”
- “overclock”

Note that not all laptops support all of these options. Specifically, not all support the “overclock” option, and it’s still unknown if this value even changes anything, other than making the user feel a bit better.

### **/sys/devices/platform/samsung/usb\_charge**

Defined on file *sysfs-driver-samsung-laptop*

Use your USB ports to charge devices, even when your laptop is powered off. 1 means enabled, 0 means disabled.

### **/sys/devices/platform/sh\_mobile\_lcdc\_fb.[0-3]/graphics/fb[0-9]/ovl\_alpha**

Defined on file *sysfs-devices-platform-sh\_mobile\_lcdc\_fb*

This file is only available on fb[0-9] devices corresponding to overlay planes.

Stores the alpha blending value for the overlay. Values range from 0 (transparent) to 255 (opaque). The value is ignored if the mode is not set to Alpha Blending.

### **/sys/devices/platform/sh\_mobile\_lcdc\_fb.[0-3]/graphics/fb[0-9]/ovl\_mode**

Defined on file *sysfs-devices-platform-sh\_mobile\_lcdc\_fb*

This file is only available on fb[0-9] devices corresponding to overlay planes.

Selects the composition mode for the overlay. Possible values are:

- 0 - Alpha Blending

- 1 - ROP3

**/sys/devices/platform/sh\_mobile\_lcdc\_fb.[0-3]/graphics/fb[0-9]/ovl\_position**

Defined on file *sysfs-devices-platform-sh\_mobile\_lcdc\_fb*

This file is only available on fb[0-9] devices corresponding to overlay planes.

Stores the x,y overlay position on the display in pixels. The position format is [0-9]+,[0-9]+.

**/sys/devices/platform/sh\_mobile\_lcdc\_fb.[0-3]/graphics/fb[0-9]/ovl\_rop3**

Defined on file *sysfs-devices-platform-sh\_mobile\_lcdc\_fb*

This file is only available on fb[0-9] devices corresponding to overlay planes.

Stores the raster operation (ROP3) for the overlay. Values range from 0 to 255. The value is ignored if the mode is not set to ROP3.

**/sys/devices/platform/stratix10-rsu.0/current\_image**

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) the address in flash of currently running image.

**/sys/devices/platform/stratix10-rsu.0/dcmf0**

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) Decision firmware copy 0 version information.

**/sys/devices/platform/stratix10-rsu.0/dcmf1**

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) Decision firmware copy 1 version information.

**/sys/devices/platform/stratix10-rsu.0/dcmf2**

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) Decision firmware copy 2 version information.

**/sys/devices/platform/stratix10-rsu.0/dcmf3**

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) Decision firmware copy 3 version information.

### /sys/devices/platform/stratix10-rsu.0/error\_details

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) error code.

### /sys/devices/platform/stratix10-rsu.0/error\_location

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) the error offset inside the image that failed.

### /sys/devices/platform/stratix10-rsu.0/fail\_image

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) the address in flash of failed image.

### /sys/devices/platform/stratix10-rsu.0/max\_retry

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) max retry parameter is stored in the firmware decision IO section, as a byte located at offset 0x18c.

### /sys/devices/platform/stratix10-rsu.0/notify

Defined on file *sysfs-devices-platform-stratix10-rsu*

(WO) client to notify firmware with different actions.

#### b[15:0]

inform firmware the current software execution stage.

- |   |   |
|---|---|
| 0 | the first stage bootloader didn't run or didn't reach the point of launching second stage bootloader. |
| 1 | failed in second bootloader or didn't get to the point of launching the operating system.             |
| 2 | both first and second stage bootloader ran and the operating system launch was attempted.             |

#### b[16]

- |   |  |
|---|--|
| 1 | firmware to reset current image retry counter. |
| 0 | no action.                                     |

### b[17]

1	firmware to clear RSU log
0	no action.

### b[18]

this is negative logic

1	no action
0	firmware record the notify code defined in b[15:0].

### **/sys/devices/platform/stratix10-rsu.0/reboot\_image**

Defined on file *sysfs-devices-platform-stratix10-rsu*

(WO) the address in flash of image to be loaded on next reboot command.

### **/sys/devices/platform/stratix10-rsu.0/retry\_counter**

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) the current image's retry counter, which is used by user to know how many times the image is still allowed to reload itself before giving up and starting RSU fail-over flow.

### **/sys/devices/platform/stratix10-rsu.0/state**

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) the state of RSU system. The state field has two parts: major error code in upper 16 bits and minor error code in lower 16 bits.

### **b[15:0]**

Currently used only when major error is 0xF006 (CPU watchdog timeout), in which case the minor error code is the value reported by CPU to firmware through the RSU notify command before the watchdog timeout occurs.

### **b[31:16]**

0xF001 bitstream error 0xF002 hardware access failure 0xF003 bitstream corruption 0xF004 internal error 0xF005 device error 0xF006 CPU watchdog timeout 0xF007 internal unknown error

### **/sys/devices/platform/stratix10-rsu.0/version**

Defined on file *sysfs-devices-platform-stratix10-rsu*

(RO) the version number of RSU firmware. 19.3 or later version includes information about the firmware which reported the error.

**pre 19.3:****b[31:0]**

0x0 version number

**19.3 or late:****b[15:0]**

0x1 version number

**b[31:16]**

0x0 no error 0x0DCF Decision CMF error 0x0ACF Application CMF error

**/sys/devices/platform/ts5500/adc**Defined on file *sysfs-platform-ts5500*

Indicates the presence of an A/D Converter. If it is present, it will display “1” , otherwise “0” .

**/sys/devices/platform/ts5500/erest**Defined on file *sysfs-platform-ts5500*

Indicates the presence of an external reset. If it is present, it will display “1” , otherwise “0” .

**/sys/devices/platform/ts5500/id**Defined on file *sysfs-platform-ts5500*

Product ID of the TS board. TS-5500 ID is 0x60.

**/sys/devices/platform/ts5500/jumpers**Defined on file *sysfs-platform-ts5500*

Bitfield showing the jumpers’ state. If a jumper is present, the corresponding bit is set. For instance, 0x0e means jumpers 2, 3 and 4 are set.

**/sys/devices/platform/ts5500/name**Defined on file *sysfs-platform-ts5500*

Model name of the TS board, e.g. “TS-5500” .

**/sys/devices/platform/ts5500/rs485**Defined on file *sysfs-platform-ts5500*

Indicates the presence of the RS485 option. If it is present, it will display “1” , otherwise “0” .

---

### **/sys/devices/platform/ts5500/sram**

---

Defined on file *sysfs-platform-ts5500*

Indicates the presence of the SRAM option. If it is present, it will display “1” , otherwise “0” .

---

### **/sys/devices/platform/usbib-vudc.%d/dev\_desc**

---

Defined on file *sysfs-platform-usbib-vudc*

This file allows to read device descriptor of gadget driver which is currently bound to this controller. It is possible to read this file only if gadget driver is bound, otherwise error is returned.

---

### **/sys/devices/platform/usbib-vudc.%d/usbib\_sockfd**

---

Defined on file *sysfs-platform-usbib-vudc*

This file allows to export usb device to connection peer. It is done by writing to this file socket fd (as a string for example “8” ) associated with a connection to remote peer who would like to use this device. It is possible to close the connection by writing -1 instead of socket fd.

---

### **/sys/devices/platform/usbib-vudc.%d/usbib\_status**

---

Defined on file *sysfs-platform-usbib-vudc*

Current status of the device. Allowed values:

- 
- |   |   |
|---|---|
| 1 | Device is available and can be exported             |
| 2 | Device is currently exported                        |
| 3 | Fatal error occurred during communication with peer |
- 

---

### **/sys/devices/socX**

---

Defined on file *sysfs-devices-soc*

The /sys/devices/ directory contains a sub-directory for each System-on-Chip (SoC) device on a running platform. Information regarding each SoC can be obtained by reading sysfs files. This functionality is only available if implemented by the platform.

The directory created for each SoC will also house information about devices which are commonly contained in /sys/devices/platform. It has been agreed that if an SoC

device exists, its supported devices would be better suited to appear as children of that SoC.

---

**/sys/devices/socX/family**

Defined on file *sysfs-devices-soc*

Read-only attribute common to all SoCs. Contains SoC family name (e.g. DB8500).

On many of ARM based silicon with SMCCC v1.2+ compliant firmware this will contain the JEDEC JEP106 manufacturer's identification code. The format is "jep106:XXYY" where XX is identity code and YY is continuation code.

This manufacturer's identification code is defined by one or more eight (8) bit fields, each consisting of seven (7) data bits plus one (1) odd parity bit. It is a single field, limiting the possible number of vendors to 126. To expand the maximum number of identification codes, a continuation scheme has been defined.

The specified mechanism is that an identity code of 0x7F represents the "continuation code" and implies the presence of an additional identity code field, and this mechanism may be extended to multiple continuation codes followed by the manufacturer's identity code.

For example, ARM has identity code 0x7F 0x7F 0x7F 0x7F 0x3B, which is code 0x3B on the fifth 'page'. This is shortened as JEP106 identity code of 0x3B and a continuation code of 0x4 to represent the four continuation codes preceding the identity code.

---

**/sys/devices/socX/machine**

Defined on file *sysfs-devices-soc*

Read-only attribute common to all SoCs. Contains the SoC machine name (e.g. Ux500).

---

**/sys/devices/socX/process**

Defined on file *sysfs-devices-soc*

Read-only attribute supported ST-Ericsson's silicon. Contains the process by which the silicon chip was manufactured.

---

**/sys/devices/socX/revision**

Defined on file *sysfs-devices-soc*

Read-only attribute supported by most SoCs. Contains the SoC's manufacturing revision number.

---

**/sys/devices/socX/serial\_number**

Defined on file *sysfs-devices-soc*

Read-only attribute supported by most SoCs. Contains the SoC's serial number, if available.

### **/sys/devices/socX/soc\_id**

Defined on file *sysfs-devices-soc*

Read-only attribute supported by most SoCs. In the case of ST-Ericsson's chips this contains the SoC serial number.

On many of ARM based silicon with SMCCC v1.2+ compliant firmware this will contain the SOC ID appended to the family attribute to ensure there is no conflict in this namespace across various vendors. The format is "jep106:XXYY:ZZZZ" where XX is identity code, YY is continuation code and ZZZZ is the SOC ID.

### **/sys/devices/system/cpu/**

Defined on file *sysfs-devices-system-cpu*

A collection of both global and individual CPU attributes

Individual CPU attributes are contained in subdirectories named by the kernel's logical CPU number, e.g.:

/sys/devices/system/cpu/cpu#/

### **/sys/devices/system/cpu/cpu#/cpu\_capacity**

Defined on file *sysfs-devices-system-cpu*

information about CPUs heterogeneity.

cpu\_capacity: capacity of cpu#.

### **/sys/devices/system/cpu/cpu#/cpufreq/\***

Defined on file *sysfs-devices-system-cpu*

Discover and change clock speed of CPUs

Clock scaling allows you to change the clock speed of the CPUs on the fly. This is a nice method to save battery power, because the lower the clock speed, the less power the CPU consumes.

There are many knobs to tweak in this directory.

See files in Documentation/cpu-freq/ for more information.

### **/sys/devices/system/cpu/cpu#/cpufreq/freqdomain\_cpus**

Defined on file *sysfs-devices-system-cpu*

Discover CPUs in the same CPU frequency coordination domain

freqdomain\_cpus is the list of CPUs (online+offline) that share the same clock/freq domain (possibly at the hardware level). That information may be hidden from the cpufreq core and the value of related\_cpus may be different from freqdomain\_cpus. This attribute is useful for user space DVFS controllers to get better power/performance results for platforms using acpi-cpufreq.

This file is only present if the acpi-cpufreq driver is in use.

---

**/sys/devices/system/cpu/cpu#/crash\_notes**

Defined on file *sysfs-devices-system-cpu*

address and size of the percpu note.

crash\_notes: the physical address of the memory that holds the note of cpu#.

crash\_notes\_size: size of the note of cpu#.

---

**/sys/devices/system/cpu/cpu#/node**

Defined on file *sysfs-devices-system-cpu*

Discover NUMA node a CPU belongs to

When CONFIG\_NUMA is enabled, a symbolic link that points to the corresponding NUMA node directory.

For example, the following symlink is created for cpu42 in NUMA node 2:

/sys/devices/system/cpu/cpu42/node2 -> ../../node/node2

---

**/sys/devices/system/cpu/cpu#/power/energy\_perf\_bias**

Defined on file *sysfs-devices-system-cpu*

Intel Energy and Performance Bias Hint (EPB)

EPB for the given CPU in a sliding scale 0 - 15, where a value of 0 corresponds to a hint preference for highest performance and a value of 15 corresponds to the maximum energy savings.

In order to change the EPB value for the CPU, write either a number in the 0 - 15 sliding scale above, or one of the strings: "performance", "balance-performance", "normal", "balance-power", "power" (that represent values reflected by their meaning), to this attribute.

This attribute is present for all online CPUs supporting the Intel EPB feature.

---

**/sys/devices/system/cpu/cpu#/topology/core\_id**

Defined on file *sysfs-devices-system-cpu*

CPU topology files that describe a logical CPU's relationship to other cores and threads in the same physical package.

One `cpu#` directory is created per logical CPU in the system, e.g. `/sys/devices/system/cpu/cpu42/`.

Briefly, the files above are:

`core_id`: the CPU core ID of `cpu#`. Typically it is the hardware platform's identifier (rather than the kernel's). The actual value is architecture and platform dependent.

`core_siblings`: internal kernel map of `cpu#`'s hardware threads within the same `physical_package_id`.

`core_siblings_list`: human-readable list of the logical CPU numbers within the same `physical_package_id` as `cpu#`.

`physical_package_id`: physical package id of `cpu#`. Typically corresponds to a physical socket number, but the actual value is architecture and platform dependent.

`thread_siblings`: internal kernel map of `cpu#`'s hardware threads within the same core as `cpu#`

`thread_siblings_list`: human-readable list of `cpu#`'s hardware threads within the same core as `cpu#`

See [\*How CPU topology info is exported via sysfs\*](#) for more information.

---

### **`/sys/devices/system/cpu/cpu*/cache/index*/<set_of_attributes_mentioned_below>`**

---

Defined on file [\*sysfs-devices-system-cpu\*](#)

Parameters for the CPU cache attributes

**`allocation_policy`:**

- **WriteAllocate:**  
allocate a memory location to a cache line on a cache miss because of a write
- **ReadAllocate:**  
allocate a memory location to a cache line on a cache miss because of a read
- **ReadWriteAllocate:**  
both writeallocate and readallocate

**`attributes`:**

LEGACY used only on IA64 and is same as `write_policy`

**`coherency_line_size`:**

the minimum amount of data in bytes that gets transferred from memory to cache

**`level`:**

the cache hierarchy in the multi-level cache configuration

**number\_of\_sets:**

total number of sets in the cache, a set is a collection of cache lines with the same cache index

**physical\_line\_partition:**

number of physical cache line per cache tag

**shared\_cpu\_list:**

the list of logical cpus sharing the cache

**shared\_cpu\_map:**

logical cpu mask containing the list of cpus sharing the cache

**size:**

the total cache size in kB

**type:**

- Instruction: cache that only holds instructions
- Data: cache that only caches data
- Unified: cache that holds both data and instructions

**ways\_of\_associativity:**

degree of freedom in placing a particular block of memory in the cache

**write\_policy:**

- **WriteThrough:**  
data is written to both the cache line and to the block in the lower-level memory
- **WriteBack:**  
data is written only to the cache line and the modified cache line is written to main memory only when it is replaced

**/sys/devices/system/cpu/cpu\*/cache/index\*/id**

Defined on file *sysfs-devices-system-cpu*

Cache id

The id provides a unique number for a specific instance of a cache of a particular type. E.g. there may be a level 3 unified cache on each socket in a server and we may assign them ids 0, 1, 2, ...

Note that id value can be non-contiguous. E.g. level 1 caches typically exist per core, but there may not be a power of two cores on a socket, so these caches may be numbered 0, 1, 2, 3, 4, 5, 8, 9, 10, ...

**/sys/devices/system/cpu/cpu\*/cache/index3/cache\_disable\_{0,1}**

Defined on file *sysfs-devices-system-cpu*

Disable L3 cache indices

These files exist in every CPU's cache/index3 directory. Each cache\_disable\_{0,1} file corresponds to one disable slot which can be used to disable a cache index. Reading from these files on a processor with this functionality will return the currently disabled index for that node. There is one L3 structure per node, or per internal node on MCM machines. Writing a valid index to one of these files will cause the specified cache index to be disabled.

All AMD processors with L3 caches provide this functionality. For details, see BKDGs at <http://developer.amd.com/documentation/guides/Pages/default.aspx>

---

### /sys/devices/system/cpu/cpuX/cpufreq/throttle\_stats

---

Defined on file *sysfs-devices-system-cpu*

POWERNV CPUFreq driver's frequency throttle stats directory and attributes

'cpuX/cpufreq/throttle\_stats' directory contains the CPU frequency throttle stat attributes for the chip. The throttle stats of a cpu is common across all the cpus belonging to a chip. Below are the throttle attributes exported in the 'throttle\_stats' directory:

- **turbo\_stat** : This file gives the total number of times the max frequency is throttled to lower frequency in turbo (at and above nominal frequency) range of frequencies.
- **sub\_turbo\_stat** : This file gives the total number of times the max frequency is throttled to lower frequency in sub-turbo(below nominal frequency) range of frequencies.
- **unthrottle** : This file gives the total number of times the max frequency is unthrottled after being throttled.
- **powercap** : This file gives the total number of times the max frequency is throttled due to 'Power Capping' .
- **overtemp** : This file gives the total number of times the max frequency is throttled due to 'CPU Over Temperature' .
- **supply\_fault** : This file gives the total number of times the max frequency is throttled due to 'Power Supply Failure' .
- **overcurrent** : This file gives the total number of times the max frequency is throttled due to 'Overcurrent' .
- **occ\_reset** : This file gives the total number of times the max frequency is throttled due to 'OCC Reset' .

The sysfs attributes representing different throttle reasons like powercap, overtemp, supply\_fault, overcurrent and occ\_reset map to the reasons provided by OCC firmware for throttling the frequency.

---

### /sys/devices/system/cpu/cpuX/cpuidle/stateN/default\_status

---

Defined on file *sysfs-devices-system-cpu*

(RO) The default status of this state, "enabled" or "disabled" .

**/sys/devices/system/cpu/cpuX/cpuidle/stateN/desc**

Defined on file *sysfs-devices-system-cpu*

(RO) A small description about the idle state (string).

**/sys/devices/system/cpu/cpuX/cpuidle/stateN/disable**

Defined on file *sysfs-devices-system-cpu*

(RW) Option to disable this idle state (bool). The behavior and the effect of the disable variable depends on the implementation of a particular governor. In the ladder governor, for example, it is not coherent, i.e. if one is disabling a light state, then all deeper states are disabled as well, but the disable variable does not reflect it. Likewise, if one enables a deep state but a lighter state still is disabled, then this has no effect.

**/sys/devices/system/cpu/cpuX/cpuidle/stateN/name**

Defined on file *sysfs-devices-system-cpu*

The directory /sys/devices/system/cpu/cpuX/cpuidle contains per logical CPU specific cpuidle information for each online cpu X. The processor idle states which are available for use have the following attributes:

name:	(RO) Name of the idle state (string).
latency:	(RO) The latency to exit out of this idle state (in microseconds).
power:	(RO) The power consumed while in this idle state (in milliwatts).
time:	(RO) The total time spent in this idle state (in microseconds).
uses:	(RO) Number of times this state was entered (a count).
age:	
above:	(RO) Number of times this state was entered, but the observed CPU idle duration was too short for it (a count).
below:	(RO) Number of times this state was entered, but the observed CPU idle duration was too long for it (a count).

**/sys/devices/system/cpu/cpuX/cpuidle/stateN/residency**

Defined on file *sysfs-devices-system-cpu*

(RO) Display the target residency i.e. the minimum amount of time (in microseconds) this cpu should spend in this idle state to make the transition worth the effort.

**/sys/devices/system/cpu/cpuX/cpuidle/stateN/s2idle/**

Defined on file *sysfs-devices-system-cpu*

Idle state usage statistics related to suspend-to-idle.

This attribute group is only present for states that can be used in suspend-to-idle with suspended timekeeping.

### **/sys/devices/system/cpu/cpuX/cpuidle/stateN/s2idle/time**

Defined on file *sysfs-devices-system-cpu*

Total time spent by the CPU in suspend-to-idle (with scheduler tick suspended) after requesting this state.

### **/sys/devices/system/cpu/cpuX/cpuidle/stateN/s2idle/usage**

Defined on file *sysfs-devices-system-cpu*

Total number of times this state has been requested by the CPU while entering suspend-to-idle.

### **/sys/devices/system/cpu/cpuX/idle\_purr**

Defined on file *sysfs-devices-system-cpu*

PURR ticks for cpuX when it was idle.

This sysfs interface exposes the number of PURR ticks for cpuX when it was idle.

### **/sys/devices/system/cpu/cpuX/idle\_spurr**

Defined on file *sysfs-devices-system-cpu*

SPURR ticks for cpuX when it was idle.

This sysfs interface exposes the number of SPURR ticks for cpuX when it was idle.

### **/sys/devices/system/cpu/cpuX/purr**

Defined on file *sysfs-devices-system-cpu*

PURR ticks for this CPU since the system boot.

The Processor Utilization Resources Register (PURR) is a 64-bit counter which provides an estimate of the resources used by the CPU thread. The contents of this register increases monotonically. This sysfs interface exposes the number of PURR ticks for cpuX.

### **/sys/devices/system/cpu/cpuX/regs/**

Defined on file *sysfs-devices-system-cpu*

## AArch64 CPU registers

‘identification’ directory exposes the CPU ID registers for identifying model and revision of the CPU.

### **/sys/devices/system/cpu/cpuX/spurr**

Defined on file *sysfs-devices-system-cpu*

SPURR ticks for this CPU since the system boot.

The Scaled Processor Utilization Resources Register (SPURR) is a 64-bit counter that provides a frequency invariant estimate of the resources used by the CPU thread. The contents of this register increases monotonically. This sysfs interface exposes the number of SPURR ticks for cpuX.

### **/sys/devices/system/cpu/cpufreq/boost**

Defined on file *sysfs-devices-system-cpu*

Processor frequency boosting control

This switch controls the boost setting for the whole system. Boosting allows the CPU and the firmware to run at a frequency beyond its nominal limit.

More details can be found in *CPU Performance Scaling*

### **/sys/devices/system/cpu/cpufreq/policyX/throttle\_stats**

Defined on file *sysfs-devices-system-cpu*

POWERNV CPUFreq driver’s frequency throttle stats directory and attributes

‘policyX/throttle\_stats’ directory and all the attributes are same as the */sys/devices/system/cpu/cpuX/cpufreq/throttle\_stats* directory and attributes which give the frequency throttle information of the chip.

### **/sys/devices/system/cpu/cpuidle/available\_governors**

Defined on file *sysfs-devices-system-cpu*

Discover cpuidle policy and mechanism

Various CPUs today support multiple idle levels that are differentiated by varying exit latencies and power consumption during idle.

Idle policy (governor) is differentiated from idle mechanism (driver).

available\_governors: (RO) displays a space separated list of available governors.

current\_driver: (RO) displays current idle mechanism.

current\_governor: (RW) displays current idle policy. Users can switch the governor at runtime by writing to this file.

current\_governor\_ro: (RO) displays current idle policy.

See [CPU Idle Time Management](#) and /driver-api/pm/cpuidle for more information.

---

### /sys/devices/system/cpu/intel\_pstate/max\_perf\_pct

---

Defined on file [sysfs-devices-system-cpu](#)

Parameters for the Intel P-state driver

Logic for selecting the current P-state in Intel Sandybridge+ processors. The three knobs control limits for the P-state that will be requested by the driver.

max\_perf\_pct: limits the maximum P state that will be requested by the driver stated as a percentage of the available performance.

min\_perf\_pct: limits the minimum P state that will be requested by the driver stated as a percentage of the available performance.

no\_turbo: limits the driver to selecting P states below the turbo frequency range.

More details can be found in [intel\\_pstate CPU Performance Scaling Driver](#)

---

### /sys/devices/system/cpu/kernel\_max

---

Defined on file [sysfs-devices-system-cpu](#)

CPU topology files that describe kernel limits related to hotplug. Briefly:

kernel\_max: the maximum cpu index allowed by the kernel configuration.

offline: cpus that are not online because they have been HOTPLUGGED off or exceed the limit of cpus allowed by the kernel configuration (kernel\_max above).

online: cpus that are online and being scheduled.

possible: cpus that have been allocated resources and can be brought online if they are present.

present: cpus that have been identified as being present in the system.

See [How CPU topology info is exported via sysfs](#) for more information.

---

### /sys/devices/system/cpu/probe

---

Defined on file [sysfs-devices-system-cpu](#)

Dynamic addition and removal of CPU's. This is not hotplug removal, this is meant complete removal/addition of the CPU from the system.

probe: writes to this file will dynamically add a CPU to the system. Information written to the file to add CPU's is architecture specific.

release: writes to this file dynamically remove a CPU from the system. Information written to the file to remove CPU's is architecture specific.

---

### /sys/devices/system/cpu/smt

---

Defined on file *sysfs-devices-system-cpu*

Control Symetric Multi Threading (SMT)

active: Tells whether SMT is active (enabled and siblings online)

**control: Read/write interface to control SMT. Possible**

values:

“on”	SMT is enabled
“off”	SMT is disabled
“forceoff”	SMT is force disabled. Cannot be changed.
“notsupported”	SMT is not supported by the CPU
“notimple- mented”	SMT runtime toggling is not implemented for the archi- tecture

If control status is “forceoff” or “notsupported” writes are rejected.

**/sys/devices/system/cpu/svm**

Defined on file *sysfs-devices-system-cpu*

Secure Virtual Machine

If 1, it means the system is using the Protected Execution Facility in POWER9 and newer processors. i.e., it is a Secure Virtual Machine.

**/sys/devices/system/cpu/umwait\_control**

Defined on file *sysfs-devices-system-cpu*

Umwait control

**enable\_c02: Read/write interface to control umwait C0.2 state**

**Read returns C0.2 state status:**

0: C0.2 is disabled 1: C0.2 is enabled

Write ‘y’ or ‘1’ or ‘on’ to enable C0.2 state. Write ‘n’ or ‘0’ or ‘off’ to disable C0.2 state.

The interface is case insensitive.

**max\_time: Read/write interface to control umwait maximum time**

in TSC-quanta that the CPU can reside in either C0.1 or C0.2 state. The time is an unsigned 32-bit number. Note that a value of zero means there is no limit. Low order two bits must be zero.

**/sys/devices/system/cpu/vulnerabilities**

Defined on file *sysfs-devices-system-cpu*

Information about CPU vulnerabilities

The files are named after the code names of CPU vulnerabilities. The output of those files reflects the state of the CPUs in the system. Possible output values:

“Not affected”	CPU is not affected by the vulnerability
“Vulnerable”	CPU is affected and no mitigation in effect
“Mitigation: \$M”	CPU is affected and mitigation \$M is in effect

See also: *Hardware vulnerabilities*

### **/sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_ce\_count**

Defined on file *sysfs-devices-edac*

This attribute file displays the total count of correctable errors that have occurred on this DIMM. This count is very important to examine. CEs provide early indications that a DIMM is beginning to fail. This count field should be monitored for non-zero values and report such information to the system administrator.

### **/sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_dev\_type**

Defined on file *sysfs-devices-edac*

This attribute file will display what type of DRAM device is being utilized on this DIMM (x1, x2, x4, x8, …).

### **/sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_edac\_mode**

Defined on file *sysfs-devices-edac*

This attribute file will display what type of Error detection and correction is being utilized. For example: S4ECD4ED would mean a Chipkill with x4 DRAM.

### **/sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_label**

Defined on file *sysfs-devices-edac*

This control file allows this DIMM to have a label assigned to it. With this label in the module, when errors occur the output can provide the DIMM label in the system log. This becomes vital for panic events to isolate the cause of the UE event. DIMM Labels must be assigned after booting, with information that correctly identifies the physical slot with its silk screen label. This information is currently very motherboard specific and determination of this information must occur in userland at this time.

### **/sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_location**

Defined on file *sysfs-devices-edac*

This attribute file will display the location (csrow/channel, branch/channel/slot or channel/slot) of the dimm or rank.

---

**/sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_mem\_type**

---

Defined on file *sysfs-devices-edac*

This attribute file will display what type of memory is currently on this csrow. Normally, either buffered or unbuffered memory (for example, Unbuffered-DDR3).

---

**/sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_ue\_count**

---

Defined on file *sysfs-devices-edac*

This attribute file displays the total count of uncorrectable errors that have occurred on this DIMM. If panic\_on\_ue is set, this counter will not have a chance to increment, since EDAC will panic the system

---

**/sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/size**

---

Defined on file *sysfs-devices-edac*

This attribute file will display the size of dimm or rank. For dimm\*/size, this is the size, in MB of the DIMM memory stick. For rank\*/size, this is the size, in MB for one rank of the DIMM memory stick. On single rank memories (1R), this is also the total size of the dimm. On dual rank (2R) memories, this is half the size of the total DIMM memories.

---

**/sys/devices/system/edac/mc/mc\*/ce\_count**

---

Defined on file *sysfs-devices-edac*

This attribute file displays the total count of correctable errors that have occurred on this memory controller. This count is very important to examine. CEs provide early indications that a DIMM is beginning to fail. This count field should be monitored for non-zero values and report such information to the system administrator.

---

**/sys/devices/system/edac/mc/mc\*/ce\_noinfo\_count**

---

Defined on file *sysfs-devices-edac*

This attribute file displays the number of CEs that have occurred on this memory controller wherewith no information as to which DIMM slot is having errors. Memory is handicapped, but operational, yet no information is available to indicate which slot the failing memory is in. This count field should be also be monitored for non-zero values.

---

**/sys/devices/system/edac/mc/mc\*/max\_location**

---

Defined on file *sysfs-devices-edac*

This attribute file displays the information about the last available memory slot in this memory controller. It is used by userspace tools in order to display the memory filling layout.

---

**/sys/devices/system/edac/mc/mc\*/mc\_name**

---

Defined on file *sysfs-devices-edac*

This attribute file displays the type of memory controller that is being utilized.

---

**/sys/devices/system/edac/mc/mc\*/reset\_counters**

---

Defined on file *sysfs-devices-edac*

This write-only control file will zero all the statistical counters for UE and CE errors on the given memory controller. Zeroing the counters will also reset the timer indicating how long since the last counter were reset. This is useful for computing errors/time. Since the counters are always reset at driver initialization time, no module/kernel parameter is available.

---

**/sys/devices/system/edac/mc/mc\*/sram\_scrub\_rate**

---

Defined on file *sysfs-devices-edac*

Read/Write attribute file that controls memory scrubbing. The scrubbing rate used by the memory controller is set by writing a minimum bandwidth in bytes/sec to the attribute file. The rate will be translated to an internal value that gives at least the specified rate. Reading the file will return the actual scrubbing rate employed. If configuration fails or memory scrubbing is not implemented, the value of the attribute file will be -1.

---

**/sys/devices/system/edac/mc/mc\*/seconds\_since\_reset**

---

Defined on file *sysfs-devices-edac*

This attribute file displays how many seconds have elapsed since the last counter reset. This can be used with the error counters to measure error rates.

---

**/sys/devices/system/edac/mc/mc\*/size\_mb**

---

Defined on file *sysfs-devices-edac*

This attribute file displays, in count of megabytes, of memory that this memory controller manages.

---

**/sys/devices/system/edac/mc/mc\*/ue\_count**

---

Defined on file *sysfs-devices-edac*

This attribute file displays the total count of uncorrectable errors that have occurred on this memory controller. If panic\_on\_ue is set, this counter will not have a chance to increment, since EDAC will panic the system

---

### **/sys/devices/system/edac/mc/mc\*/ue\_noinfo\_count**

---

Defined on file *sysfs-devices-edac*

This attribute file displays the number of UEs that have occurred on this memory controller with no information as to which DIMM slot is having errors.

---

### **/sys/devices/system(ibm\_rtl/state**

---

Defined on file *sysfs-devices-system-ibm-rtl*

The state file allows a means by which to change in and out of Premium Real-Time Mode (PRTM), as well as the ability to query the current state.

- 0 => PRTM off
- 1 => PRTM enabled

Users: The ibm-prtm userspace daemon uses this interface.

---

### **/sys/devices/system(ibm\_rtl/version**

---

Defined on file *sysfs-devices-system-ibm-rtl*

The version file provides a means by which to query the RTL table version that lives in the Extended BIOS Data Area (EBDA).

Users: The ibm-prtm userspace daemon uses this interface.

---

### **/sys/devices/system/memory**

---

Defined on file *sysfs-devices-memory*

The */sys/devices/system/memory* contains a snapshot of the internal state of the kernel memory blocks. Files could be added or removed dynamically to represent hot-add/remove operations.

Users: hotplug memory add/remove tools <http://www.ibm.com/developerworks/wikis/display/LinuxP/powerpc-utils>

---

### **/sys/devices/system/memory/hard\_offline\_page**

---

Defined on file *sysfs-memory-page-offline*

Hard-offline the memory page containing the physical address written into this file. Input is a hex number specifying the physical address of the page. The kernel

will then attempt to hard-offline the page, by trying to drop the page or killing any owner or triggering IO errors if needed. Note this may kill any processes owning the page. The kernel will avoid to access this page assuming it's poisoned by the hardware.

The offlining is done in kernel specific granularity. Normally it's the base page size of the kernel, but this might change.

Return value is the size of the number, or a error when the offlining failed. Reading the file is not allowed.

### /sys/devices/system/memory/memoryX/phys\_device

---

Defined on file *sysfs-devices-memory*

The file */sys/devices/system/memory/memoryX/phys\_device* is read-only; it is a legacy interface only ever used on s390x to expose the covered storage increment.

Users: Legacy s390-tools lsmem/chmem

### /sys/devices/system/memory/memoryX/phys\_index

---

Defined on file *sysfs-devices-memory*

The file */sys/devices/system/memory/memoryX/phys\_index* is read-only and contains the section ID in hexadecimal which is equivalent to decimal X contained in the memory section directory name.

### /sys/devices/system/memory/memoryX/removable

---

Defined on file *sysfs-devices-memory*

The file */sys/devices/system/memory/memoryX/removable* indicates whether this memory block is removable or not. This is useful for a user-level agent to determine identify removable sections of the memory before attempting potentially expensive hot-remove memory operation

Users: hotplug memory remove tools <http://www.ibm.com/developerworks/wikis/display/LinuxP/powerpc-utils>

### /sys/devices/system/memory/memoryX/state

---

Defined on file *sysfs-devices-memory*

The file */sys/devices/system/memory/memoryX/state* is read-write. When read, its contents show the online/offline state of the memory section. When written, root can toggle the the online/offline state of a removable memory section (see removable file description above) using the following commands:

```
# echo online > :ref:`\ /sys\ /devices\ /system\ /memory\ /memoryX\ /`  
→state <abi_sys_devices_system_memory_memoryx_state>
```

(continues on next page)

(continued from previous page)

```
# echo offline > :ref:`\sys\devices\system\memory\memoryX\`  
→state <abi_sys_devices_system_memory_memoryx_state>`
```

For example, if /sys/devices/system/memory/memory22/removable contains a value of 1 and /sys/devices/system/memory/memory22/state contains the string “online” the following command can be executed by root to offline that section:

```
# echo offline > /sys/devices/system/memory/memory22/state
```

Users: hotplug memory remove tools <http://www.ibm.com/developerworks/wikis/display/LinuxP/powerpc-utils>

### **/sys/devices/system/memory/memoryX/valid\_zones**

Defined on file *sysfs-devices-memory*

The file */sys/devices/system/memory/memoryX/valid\_zones* is read-only and is designed to show which zone this memory block can be onlined to.

### **/sys/devices/system/memory/soft\_offline\_page**

Defined on file *sysfs-memory-page-offline*

Soft-offline the memory page containing the physical address written into this file. Input is a hex number specifying the physical address of the page. The kernel will then attempt to soft-offline it, by moving the contents elsewhere or dropping it if possible. The kernel will then be placed on the bad page list and never be reused.

The offlining is done in kernel specific granularity. Normally it's the base page size of the kernel, but this might change.

The page must be still accessible, not poisoned. The kernel will never kill anything for this, but rather fail the offline. Return value is the size of the number, or an error when the offlining failed. Reading the file is not allowed.

### **/sys/devices/system/memoryX/nodeY**

Defined on file *sysfs-devices-memory*

When CONFIG\_NUMA is enabled, a symbolic link that points to the corresponding NUMA node directory.

For example, the following symbolic link is created for memory section 9 on node0:  
`/sys/devices/system/memory/memory9/node0 -> ../../node/node0`

### **/sys/devices/system/node/nodeX/memoryY**

Defined on file *sysfs-devices-memory*

When CONFIG\_NUMA is enabled `/sys/devices/system/node/nodeX/memoryY` is a symbolic link that points to the corresponding `/sys/devices/system/memory/memoryY` memory section directory. For example, the following symbolic link is created for memory section 9 on node0.

```
/sys/devices/system/node/node0/memory9 -> ../../memory/memory9
```

---

### **/sys/devices/system/xen\_cpu/**

Defined on file *sysfs-devices-system-xen\_cpu*

A collection of global/individual Xen physical cpu attributes

Individual physical cpu attributes are contained in subdirectories named by the Xen's logical cpu number, e.g.: `/sys/devices/system/xen_cpu/xen_cpu#/`

---

### **/sys/devices/system/xen\_cpu/xen\_cpu#/online**

Defined on file *sysfs-devices-system-xen\_cpu*

Interface to online/offline Xen physical cpus

When running under Xen platform, it provide user interface to online/offline physical cpus, except cpu0 due to several logic restrictions and assumptions.

---

### **/sys/devices/uncore\_iio\_x/dieX**

Defined on file *sysfs-devices-mapping*

Each IIO stack (PCIe root port) has its own IIO PMON block, so each dieX file (where X is die number) holds "Segment:Root Bus" for PCIe root port, which can be monitored by that IIO PMON block. For example, on 4-die Xeon platform with up to 6 IIO stacks per die and, therefore, 6 IIO PMON blocks per die, the mapping of IIO PMON block 0 exposes as the following:

```
$ ls /sys/devices/uncore_iio_0/die*
-r--r--r-- /sys/devices/uncore_iio_0/die0
-r--r--r-- /sys/devices/uncore_iio_0/die1
-r--r--r-- /sys/devices/uncore_iio_0/die2
-r--r--r-- /sys/devices/uncore_iio_0/die3

$ tail /sys/devices/uncore_iio_0/die*
==> /sys/devices/uncore_iio_0/die0 <==
0000:00
==> /sys/devices/uncore_iio_0/die1 <==
0000:40
==> /sys/devices/uncore_iio_0/die2 <==
0000:80
==> /sys/devices/uncore_iio_0/die3 <==
0000:c0
```

Which means:

```
IIO PMU 0 on die 0 belongs to PCI RP on bus 0x00, domain 0x0000
IIO PMU 0 on die 1 belongs to PCI RP on bus 0x40, domain 0x0000
IIO PMU 0 on die 2 belongs to PCI RP on bus 0x80, domain 0x0000
IIO PMU 0 on die 3 belongs to PCI RP on bus 0xc0, domain 0x0000
```

### 5.2.23 Symbols under /sys/firmware

#### /sys/firmware/acpi/bgrt/

Defined on file *sysfs-firmware-acpi*

The BGRT is an ACPI 5.0 feature that allows the OS to obtain a copy of the firmware boot splash and some associated metadata. This is intended to be used by boot splash applications in order to interact with the firmware boot splash in order to avoid jarring transitions.

image: The image bitmap. Currently a 32-bit BMP. status: 1 if the image is valid, 0 if firmware invalidated it. type: 0 indicates image is in BMP format.

ver-	The version of the BGRT. Currently 1.
sion:	
xoff-	The number of pixels between the left of the screen and the left edge
set:	of the image.
yoff-	The number of pixels between the top of the screen and the top edge
set:	of the image.

#### /sys/firmware/acpi/hotplug/

Defined on file *sysfs-firmware-acpi*

There are separate hotplug profiles for different classes of devices supported by ACPI, such as containers, memory modules, processors, PCI root bridges etc. A hotplug profile for a given class of devices is a collection of settings defining the way that class of devices will be handled by the ACPI core hotplug code. Those profiles are represented in sysfs as subdirectories of </sys/firmware/acpi/hotplug/>.

The following setting is available to user space for each hotplug profile:

en-	If set, the ACPI core will handle notifications of hotplug events associated able with the given class of devices and will allow those devices to be ejected with the help of the _EJ0 control method. Unsetting it effectively disables hotplug for the corresponding class of devices.
-----	---

The value of the above attribute is an integer number: 1 (set) or 0 (unset). Attempts to write any other values to it will cause -EINVAL to be returned.

#### /sys/firmware/acpi/interrupts/

Defined on file [sysfs-firmware-acpi](#)

All ACPI interrupts are handled via a single IRQ, the System Control Interrupt (SCI), which appears as “acpi” in /proc/interrupts.

However, one of the main functions of ACPI is to make the platform understand random hardware without special driver support. So while the SCI handles a few well known (fixed feature) interrupt sources, such as the power button, it can also handle a variable number of a “General Purpose Events” (GPE).

A GPE vectors to a specified handler in AML, which can do anything the BIOS writer wants from OS context. GPE 0x12, for example, would vector to a level or edge handler called \_L12 or \_E12. The handler may do its business and return. Or the handler may send a Notify event to a Linux device driver registered on an ACPI device, such as a battery, or a processor.

To figure out where all the SCI’s are coming from, /sys/firmware/acpi/interrupts contains a file listing every possible source, and the count of how many times it has triggered:

```
$ cd /sys/firmware/acpi/interrupts
$ grep . *
error:          0
ff_gbl_lock:    0   enable
ff_pmtimer:     0   invalid
ff_pwr_btn:     0   enable
ff_rt_clk:      2   disable
ff_slp_btn:     0   invalid
gpe00:          0   invalid
gpe01:          0   enable
gpe02:         108   enable
gpe03:          0   invalid
gpe04:          0   invalid
gpe05:          0   invalid
gpe06:          0   enable
gpe07:          0   enable
gpe08:          0   invalid
gpe09:          0   invalid
gpe0A:          0   invalid
gpe0B:          0   invalid
gpe0C:          0   invalid
gpe0D:          0   invalid
gpe0E:          0   invalid
gpe0F:          0   invalid
gpe10:          0   invalid
gpe11:          0   invalid
gpe12:          0   invalid
gpe13:          0   invalid
gpe14:          0   invalid
gpe15:          0   invalid
gpe16:          0   invalid
gpe17:        1084   enable
gpe18:          0   enable
```

(continues on next page)

(continued from previous page)

gpe19:	0	invalid
gpe1A:	0	invalid
gpe1B:	0	invalid
gpe1C:	0	invalid
gpe1D:	0	invalid
gpe1E:	0	invalid
gpe1F:	0	invalid
gpe_all:	1192	
sci:	1194	
sci_not:	0	

sci	The number of times the ACPI SCI has been called and claimed an interrupt.
sci_not	The number of times the ACPI SCI has been called and NOT claimed an interrupt.
gpe_all	count of SCI caused by GPEs.
gpeXX	count for individual GPE source
ff_gbl_loc1	Global Lock
ff_pmtimer	PM Timer
ff_pwr_btr	Power Button
ff_rt_clk	Real Time Clock
ff_slp_btn	Sleep Button
error	an interrupt that can't be accounted for above.
invalid	it's either a GPE or a Fixed Event that doesn't have an event handler.
disable	the GPE/Fixed Event is valid but disabled.
enable	the GPE/Fixed Event is valid and enabled.

Root has permission to clear any of these counters. Eg.:

```
# echo 0 > gpe11
```

All counters can be cleared by clearing the total “sci” :

```
# echo 0 > sci
```

None of these counters has an effect on the function of the system, they are simply statistics.

Besides this, user can also write specific strings to these files to enable/disable/clear ACPI interrupts in user space, which can be used to debug some ACPI interrupt storm issues.

Note that only writing to VALID GPE/Fixed Event is allowed, i.e. user can only change the status of runtime GPE and Fixed Event with event handler installed.

Let's take power button fixed event for example, please kill acpid and other user space applications so that the machine won't shutdown when pressing the power button:

```
# cat ff_pwr_btn
0      enabled
# press the power button for 3 times;
# cat ff_pwr_btn
3      enabled
# echo disable > ff_pwr_btn
# cat ff_pwr_btn
3      disabled
# press the power button for 3 times;
# cat ff_pwr_btn
3      disabled
# echo enable > ff_pwr_btn
# cat ff_pwr_btn
4      enabled
/*
 * this is because the status bit is set even if the enable
 * bit is cleared, and it triggers an ACPI fixed event when
 * the enable bit is set again
 */
# press the power button for 3 times;
# cat ff_pwr_btn
7      enabled
# echo disable > ff_pwr_btn
# press the power button for 3 times;
# echo clear > ff_pwr_btn      /* clear the status bit */
# echo disable > ff_pwr_btn
# cat ff_pwr_btn
7      enabled
```

### **/sys/firmware/devicetree/\***

Defined on file [sysfs-firmware-ofw](#)

When using OpenFirmware or a Flattened Device Tree to enumerate hardware, the device tree structure will be exposed in this directory.

It is possible for multiple device-tree directories to exist. Some device drivers use a separate detached device tree which have no attachment to the system tree and will appear in a different subdirectory under /sys/firmware/devicetree.

Userspace must not use the /sys/firmware/devicetree/base path directly, but instead should follow /proc/device-tree symlink. It is possible that the absolute path will change in the future, but the symlink is the stable ABI.

The /proc/device-tree symlink replaces the devicetree /proc filesystem support, and has largely the same semantics and should be compatible with existing userspace.

The contents of /sys/firmware/devicetree/ is a hierarchy of directories, one per device tree node. The directory name is the resolved path component name (node name plus address). Properties are represented as files in the directory. The contents of each file is the exact binary data from the device tree.

---

**/sys/firmware/dmi/entries/**

Defined on file [sysfs-firmware-dmi-entries](#)

Many machines' firmware (x86 and ia64) export DMI / SMBIOS tables to the operating system. Getting at this information is often valuable to userland, especially in cases where there are OEM extensions used.

The kernel itself does not rely on the majority of the information in these tables being correct. It equally cannot ensure that the data as exported to userland is without error either.

DMI is structured as a large table of entries, where each entry has a common header indicating the type and length of the entry, as well as a firmware-provided 'handle' that is supposed to be unique amongst all entries.

Some entries are required by the specification, but many others are optional. In general though, users should never expect to find a specific entry type on their system unless they know for certain what their firmware is doing. Machine to machine experiences will vary.

Multiple entries of the same type are allowed. In order to handle these duplicate entry types, each entry is assigned by the operating system an 'instance', which is derived from an entry type's ordinal position. That is to say, if there are 'N' multiple entries with the same type "T" in the DMI tables (adjacent or spread apart, it doesn't matter), they will be represented in sysfs as entries "T-0" through "T-(N-1)":

Example entry directories:

```
/sys/firmware/dmi/entries/17-0  
/sys/firmware/dmi/entries/17-1  
/sys/firmware/dmi/entries/17-2  
/sys/firmware/dmi/entries/17-3  
...
```

Instance numbers are used in lieu of the firmware assigned entry handles as the kernel itself makes no guarantees that handles as exported are unique, and there are likely firmware images that get this wrong in the wild.

Each DMI entry in sysfs has the common header values exported as attributes:

han	The 16bit ‘handle’ that is assigned to this entry by the firmware. This handle may be referred to by other entries.
leng	The length of the entry, as presented in the entry itself. Note that this is <u>not</u> the total count of bytes associated with the entry. This value represents the length of the “formatted” portion of the entry. This “formatted” region is sometimes followed by the “unformatted” region composed of null terminated strings, with termination signalled by a two null characters in series.
raw	The raw bytes of the entry. This includes the “formatted” portion of the entry, the “unformatted” strings portion of the entry, and the two terminating null characters.
type	The type of the entry. This value is the same as found in the directory name. It indicates how the rest of the entry should be interpreted.
instan	The instance ordinal of the entry for the given type. This value is the same as found in the parent directory name.
posi	The ordinal position (zero-based) of the entry within the entirety of the DMI entry table.
tion	

### Entry Specialization

Some entry types may have other information available in sysfs. Not all types are specialized.

#### Type 15 - System Event Log

This entry allows the firmware to export a log of events the system has taken. This information is typically backed by nvram, but the implementation details are abstracted by this table. This entry’s data is exported in the directory:

```
/sys/firmware/dmi/entries/15-0/system_event_log
```

and has the following attributes (documented in the SMBIOS / DMI specification under “System Event Log (Type 15)” :

- area\_length
- header\_start\_offset
- data\_start\_offset
- access\_method
- status
- change\_token
- access\_method\_address
- header\_format
- per\_log\_type\_descriptor\_length
- type\_descriptors\_supported\_count

As well, the kernel exports the binary attribute:

raw_event_log	The raw binary bits of the event log as described by the DMI entry.
---------------	---

---

### /sys/firmware/dmi/tables/

---

Defined on file *sysfs-firmware-dmi-tables*

The firmware provides DMI structures as a packed list of data referenced by a SMBIOS table entry point. The SMBIOS entry point contains general information, like SMBIOS version, DMI table size, etc. The structure, content and size of SMBIOS entry point is dependent on SMBIOS version. The format of SMBIOS entry point and DMI structures can be read in SMBIOS specification.

The dmi/tables provides raw SMBIOS entry point and DMI tables through sysfs as an alternative to utilities reading them from /dev/mem. The raw SMBIOS entry point and DMI table are presented as binary attributes and are accessible via:

/sys/firmware/dmi/tables/smbios\_entry\_point /sys/firmware/dmi/tables/DMI

The complete DMI information can be obtained using these two tables.

---

### /sys/firmware/efi/config\_table

---

Defined on file *sysfs-firmware-efi*

It shows the physical address of config table entry in the EFI system table.

Users: Kexec

---

### /sys/firmware/efi/esrt/

---

Defined on file *sysfs-firmware-efi-esrt*

Provides userland access to read the EFI System Resource Table (ESRT), a catalog of firmware for which can be updated with the UEFI UpdateCapsule mechanism described in section 7.5 of the UEFI Standard.

Users: fwupdate - <https://github.com/rhinstaller/fwupdate>

---

### /sys/firmware/efi/esrt/entries/entry\$N/

---

Defined on file *sysfs-firmware-efi-esrt*

Each ESRT entry is identified by a GUID, and each gets a subdirectory under entries/. example: /sys/firmware/efi/esrt/entries/entry0/

---

### /sys/firmware/efi/esrt/entries/entry\$N/capsule\_flags

---

Defined on file *sysfs-firmware-efi-esrt*

Flags that must be passed to UpdateCapsule()

### /sys/firmware/efi/esrt/entries/entry\$N/fw\_class

Defined on file *sysfs-firmware-efi-esrt*

This is the entry's guid, and will match the directory name.

### /sys/firmware/efi/esrt/entries/entry\$N/fw\_type

Defined on file *sysfs-firmware-efi-esrt*

What kind of firmware entry this is:

0	Unknown
1	System Firmware
2	Device Firmware
3	UEFI Driver

### /sys/firmware/efi/esrt/entries/entry\$N/fw\_version

Defined on file *sysfs-firmware-efi-esrt*

The version of the firmware currently installed. This is a 32-bit unsigned integer.

### /sys/firmware/efi/esrt/entries/entry\$N/last\_attempt\_status

Defined on file *sysfs-firmware-efi-esrt*

The result of the last firmware update attempt for the firmware resource entry.

0	Success
1	Insufficient resources
2	Incorrect version
3	Invalid format
4	Authentication error
5	AC power event
6	Battery power event

### /sys/firmware/efi/esrt/entries/entry\$N/last\_attempt\_version

Defined on file *sysfs-firmware-efi-esrt*

The last firmware version for which an update was attempted.

### /sys/firmware/efi/esrt/entries/entry\$N/lowest\_supported\_fw\_version

Defined on file *sysfs-firmware-efi-esrt*

The lowest version of the firmware that can be installed.

---

### **/sys/firmware/efi/esrt/fw\_resource\_count**

---

Defined on file *sysfs-firmware-efi-esrt*

The number of entries in the ESRT

---

### **/sys/firmware/efi/esrt/fw\_resource\_count\_max**

---

Defined on file *sysfs-firmware-efi-esrt*

The maximum number of entries that /could/ be registered in the allocation the table is currently in. This is really only useful to the system firmware itself.

---

### **/sys/firmware/efi/esrt/fw\_resource\_version**

---

Defined on file *sysfs-firmware-efi-esrt*

The version of the ESRT structure provided by the firmware.

---

### **/sys/firmware/efi/fw\_vendor**

---

Defined on file *sysfs-firmware-efi*

It shows the physical address of firmware vendor field in the EFI system table.

Users: Kexec

---

### **/sys/firmware/efi/runtime**

---

Defined on file *sysfs-firmware-efi*

It shows the physical address of runtime service table entry in the EFI system table.

Users: Kexec

---

### **/sys/firmware/efi/runtime-map/**

---

Defined on file *sysfs-firmware-efi-runtime-map*

Switching efi runtime services to virtual mode requires that all efi memory ranges which have the runtime attribute bit set to be mapped to virtual addresses.

The efi runtime services can only be switched to virtual mode once without rebooting. The kexec kernel must maintain the same physical to virtual address mappings as the first kernel. The mappings are exported to sysfs so userspace tools can reassemble them and pass them into the kexec kernel.

[`/sys/firmware/efi/runtime-map`](#) is the directory the kernel exports that information in.

subdirectories are named with the number of the memory range:

```
/sys/firmware/efi/runtime-map/0  
/sys/firmware/efi/runtime-map/1  
/sys/firmware/efi/runtime-map/2  
/sys/firmware/efi/runtime-map/3  
...
```

Each subdirectory contains five files:

<code>attribute</code>	The attributes of the memory range.
<code>num_pages</code>	The size of the memory range in pages.
<code>phys_addr</code>	The physical address of the memory range.
<code>type</code>	The type of the memory range.
<code>virt_addr</code>	The virtual address of the memory range.

Above values are all hexadecimal numbers with the ‘0x’ prefix.

Users: Kexec

### **[`/sys/firmware/efi/systab`](#)**

Defined on file [\*sysfs-firmware-efi\*](#)

Displays the physical addresses of all EFI Configuration Tables found via the EFI System Table. The order in which the tables are printed forms an ABI and newer versions are always printed first, i.e. ACPI20 comes before ACPI.

Users: dmidecode

### **[`/sys/firmware/efi/tables/rcti2`](#)**

Defined on file [\*sysfs-firmware-efi\*](#)

Displays the content of the Runtime Configuration Interface Table version 2 on Dell EMC PowerEdge systems in binary format

Users: It is used by Dell EMC OpenManage Server Administrator tool to populate BIOS setup page.

### **[`/sys/firmware/fdt`](#)**

Defined on file [\*sysfs-firmware-ofw\*](#)

Exports the FDT blob that was passed to the kernel by the bootloader. This allows userland applications such as kexec to access the raw binary. This blob is also useful when debugging since it contains any changes made to the blob by the bootloader.

The fact that this node does not reside under /sys/firmware/device-tree is deliberate: FDT is also used on arm64 UEFI/ACPI systems to communicate just the UEFI and ACPI entry points, but the FDT is never unflattened and used to configure the system.

A CRC32 checksum is calculated over the entire FDT blob, and verified at late\_initcall time. The sysfs entry is instantiated only if the checksum is valid, i.e., if the FDT blob has not been modified in the mean time. Otherwise, a warning is printed.

Users: kexec, debugging

### /sys/firmware/gsmi

Defined on file [sysfs-firmware-gsmi](#)

Some servers used internally at Google have firmware that provides callback functionality via explicit SMI triggers. Some of the callbacks are similar to those provided by the EFI runtime services page, but due to historical reasons this different entry-point has been used.

The gsmi driver implements the kernel's abstraction for these firmware callbacks. Currently, this functionality is limited to handling the system event log and getting access to EFI-style variables stored in nvram.

Layout:

/sys/firmware/gsmi/vars:

This directory has the same layout (and underlying implementation as /sys/firmware/efi/vars. See [Documentation/ABI/\\*/sysfs-firmware-efi-vars](#) for more information on how to interact with this structure.

/sys/firmware/gsmi/append\_to\_eventlog - write-only:

This file takes a binary blob and passes it onto the firmware to be timestamped and appended to the system eventlog. The binary format is interpreted by the firmware and may change from platform to platform. The only kernel-enforced requirement is that the blob be prefixed with a 32bit host-endian type used as part of the firmware call.

/sys/firmware/gsmi/clear\_config - write-only:

Writing any value to this file will cause the entire firmware configuration to be reset to “factory defaults”. Callers should assume that a reboot is required for the configuration to be cleared.

/sys/firmware/gsmi/clear\_eventlog - write-only:

This file is used to clear out a portion/the whole of the system event log. Values written should be values between 1 and 100 inclusive (in ASCII) representing the fraction of the log to clear. Not all platforms support fractional clearing though, and this writes to this file will error out if the firmware doesn't like your submitted fraction.

Callers should assume that a reboot is needed for this operation to complete.

### **/sys/firmware/ibft/acpi\_header**

Defined on file *sysfs-ibft*

The */sys/firmware/ibft/acpi\_header* directory will contain files that expose the SIG-NATURE, OEM\_ID, and OEM\_TABLE\_ID fields of the acpi table header of the iBFT structure. This will allow for identification of the creator of the table which is useful in determining quirks associated with some adapters when used in hardware vs software iscsi initiator mode.

### **/sys/firmware/ibft/ethernetX**

Defined on file *sysfs-ibft*

The */sys/firmware/ibft/ethernetX* directory will contain files that expose the iSCSI Boot Firmware Table NIC data. Usually this contains the IP address, MAC, and gateway of the NIC.

### **/sys/firmware/ibft/initiator**

Defined on file *sysfs-ibft*

The */sys/firmware/ibft/initiator* directory will contain files that expose the iSCSI Boot Firmware Table initiator data. Usually this contains the Initiator name.

### **/sys/firmware/ibft/targetX**

Defined on file *sysfs-ibft*

The */sys/firmware/ibft/targetX* directory will contain files that expose the iSCSI Boot Firmware Table target data. Usually this contains the target's IP address, boot LUN, target name, and what NIC it is associated with. It can also contain the CHAP name (and password), the reverse CHAP name (and password)

### **/sys/firmware/log**

Defined on file *sysfs-firmware-log*

The */sys/firmware/log* is a binary file that represents a read-only copy of the firmware's log if one is available.

### **/sys/firmware/memmap/**

Defined on file *sysfs-firmware-memmap*

On all platforms, the firmware provides a memory map which the kernel reads. The resources from that memory map are registered in the kernel resource tree and exposed to userspace via /proc/iomem (together with other resources).

However, on most architectures that firmware-provided memory map is modified afterwards by the kernel itself, either because the kernel merges that memory map with other information or just because the user overwrites that memory map via command line.

kexec needs the raw firmware-provided memory map to setup the parameter segment of the kernel that should be booted with kexec. Also, the raw memory map is useful for debugging. For that reason, `/sys/firmware/memmap` is an interface that provides the raw memory map to userspace.

The structure is as follows: Under `/sys/firmware/memmap` there are subdirectories with the number of the entry as their name:

```
/sys/firmware/memmap/0
/sys/firmware/memmap/1
/sys/firmware/memmap/2
/sys/firmware/memmap/3
...
```

The maximum depends on the number of memory map entries provided by the firmware. The order is just the order that the firmware provides.

Each directory contains three files:

<code>start</code>	The start address (as hexadecimal number with the ‘0x’ prefix).
<code>end</code>	The end address, inclusive (regardless whether the firmware provides inclusive or exclusive ranges).
<code>type</code>	Type of the entry as string. See below for a list of valid types.

So, for example:

```
/sys/firmware/memmap/0/start
/sys/firmware/memmap/0/end
/sys/firmware/memmap/0/type
/sys/firmware/memmap/1/start
...
```

Currently following types exist:

- System RAM
- ACPI Tables
- ACPI Non-volatile Storage
- reserved

Following shell snippet can be used to display that memory map in a human-readable format:

```
#!/bin/bash
cd /sys/firmware/memmap
for dir in * ; do
    start=$(cat $dir/start)
```

(continues on next page)

(continued from previous page)

```
end=$(cat $dir/end)
type=$(cat $dir/type)
printf "%016x-%016x (%s)\n" $start ${end:+$end+1} "$type"
done
```

### **/sys/firmware/opal/powercap**

Defined on file *sysfs-firmware-opal-powercap*

Powercap directory for Powernv (P8, P9) servers

Each folder in this directory contains a power-cappable component.

### **/sys/firmware/opal/powercap/system-powercap**

Defined on file *sysfs-firmware-opal-powercap*

System powercap directory and attributes applicable for Powernv (P8, P9) servers

This directory provides powercap information. It contains below sysfs attributes:

- powercap-min : This file provides the minimum possible powercap in Watt units
- powercap-max : This file provides the maximum possible powercap in Watt units
- powercap-current : This file provides the current powercap set on the system. Writing to this file creates a request for setting a new-powercap. The powercap requested must be between powercap-min and powercap-max.

### **/sys/firmware/opal/psr**

Defined on file *sysfs-firmware-opal-psr*

Power-Shift-Ratio directory for Powernv P9 servers

Power-Shift-Ratio allows to provide hints the firmware to shift/throttle power between different entities in the system. Each attribute in this directory indicates a settable PSR.

### **/sys/firmware/opal/psr/cpu\_to\_gpu\_X**

Defined on file *sysfs-firmware-opal-psr*

PSR sysfs attributes for Powernv P9 servers

Power-Shift-Ratio between CPU and GPU for a given chip with chip-id X. This file gives the ratio (0-100) which is used by OCC for power-capping.

### **/sys/firmware/opal/sensor\_groups**

Defined on file [\*sysfs-firmware-opal-sensor-groups\*](#)

Sensor groups directory for POWER9 powernv servers

Each folder in this directory contains a sensor group which are classified based on type of the sensor like power, temperature, frequency, current, etc. They can also indicate the group of sensors belonging to different owners like CSM, Profiler, Job-Scheduler

### **/sys/firmware/opal/sensor\_groups/<sensor\_group\_name>/clear**

Defined on file [\*sysfs-firmware-opal-sensor-groups\*](#)

Sysfs file to clear the min-max of all the sensors belonging to the group.

Writing 1 to this file will clear the minimum and maximum values of all the sensors in the group. In POWER9, the min-max of a sensor is the historical minimum and maximum value of the sensor cached by OCC.

### **/sys/firmware/qemu\_fw\_cfg/**

Defined on file [\*sysfs-firmware-qemu\\_fw\\_cfg\*](#)

Several different architectures supported by QEMU (x86, arm, sun4\*, ppc/mac) are provisioned with a firmware configuration (fw\_cfg) device, originally intended as a way for the host to provide configuration data to the guest firmware. Starting with QEMU v2.4, arbitrary fw\_cfg file entries may be specified by the user on the command line, which makes fw\_cfg additionally useful as an out-of-band, asynchronous mechanism for providing configuration data to the guest userspace.

The authoritative guest-side hardware interface documentation to the fw\_cfg device can be found in “docs/specs/fw\_cfg.txt” in the QEMU source tree.

#### **SysFS fw\_cfg Interface**

The fw\_cfg sysfs interface described in this document is only intended to display discoverable blobs (i.e., those registered with the file directory), as there is no way to determine the presence or size of “legacy” blobs (with selector keys between 0x0002 and 0x0018) programmatically.

All fw\_cfg information is shown under:

#### [\*/sys/firmware/qemu\\_fw\\_cfg/\*](#)

The only legacy blob displayed is the fw\_cfg device revision:

#### [\*/sys/firmware/qemu\\_fw\\_cfg/rev\*](#)

#### **Discoverable fw\_cfg blobs by selector key**

All discoverable blobs listed in the fw\_cfg file directory are displayed as entries named after their unique selector key value, e.g.:

[\*/sys/firmware/qemu\\_fw\\_cfg/by\\_key/32\*](#) [\*/sys/firmware/qemu\\_fw\\_cfg/by\\_key/33\*](#)  
[\*/sys/firmware/qemu\\_fw\\_cfg/by\\_key/34\*](#) ...

Each such fw\_cfg sysfs entry has the following values exported as attributes:

nam	The 56-byte nul-terminated ASCII string used as the blob's 'file name' in the fw_cfg directory.
size	The length of the blob, as given in the fw_cfg directory.
key	The value of the blob's selector key as given in the fw_cfg directory. This value is the same as used in the parent directory name.
raw	The raw bytes of the blob, obtained by selecting the entry via the control register, and reading a number of bytes equal to the blob size from the data register.

### **Listing fw\_cfg blobs by file name**

While the fw\_cfg device does not impose any specific naming convention on the blobs registered in the file directory, QEMU developers have traditionally used path name semantics to give each blob a descriptive name. For example:

```
"bootorder"
"genroms/kvmvapic.bin"
"etc/e820"
"etc/boot-fail-wait"
"etc/system-states"
"etc/table-loader"
"etc/acpi/rsdp"
"etc/acpi/tables"
"etc/smbios/smbios-tables"
"etc/smbios/smbios-anchor"
...
```

In addition to the listing by unique selector key described above, the fw\_cfg sysfs driver also attempts to build a tree of directories matching the path name components of fw\_cfg blob names, ending in symlinks to the by\_key entry for each "basename", as illustrated below (assume current directory is /sys/firmware):

```
qemu_fw_cfg/by_name/bootorder -> ../../by_key/38
qemu_fw_cfg/by_name/etc/e820 -> ../../..../by_key/35
qemu_fw_cfg/by_name/etc/acpi/rsdp -> ../../..../..../by_key/41
...
```

Construction of the directory tree and symlinks is done on a "best-effort" basis, as there is no guarantee that components of fw\_cfg blob names are always "well behaved". I.e., there is the possibility that a symlink (basename) will conflict with a dirname component of another fw\_cfg blob, in which case the creation of the offending /sys/firmware/qemu\_fw\_cfg/by\_name entry will be skipped.

The authoritative list of entries will continue to be found under the /sys/firmware/qemu\_fw\_cfg/by\_key directory.

### **/sys/firmware/secvar**

Defined on file [sysfs-secvar](#)

This directory is created if the POWER firmware supports OS secureboot, thereby secure variables. It exposes interface for reading/writing the secure variables

---

**/sys/firmware/secvar/format**

Defined on file *sysfs-secvar*

A string indicating which backend is in use by the firmware. This determines the format of the variable and the accepted format of variable updates.

---

**/sys/firmware/secvar/vars**

Defined on file *sysfs-secvar*

This directory lists all the secure variables that are supported by the firmware.

---

**/sys/firmware/secvar/vars/<variable name>**

Defined on file *sysfs-secvar*

Each secure variable is represented as a directory named as <variable\_name>. The variable name is unique and is in ASCII representation. The data and size can be determined by reading their respective attribute files.

---

**/sys/firmware/secvar/vars/<variable\_name>/data**

Defined on file *sysfs-secvar*

A read-only file containing the value of the variable. The size of the file represents the maximum size of the variable data.

---

**/sys/firmware/secvar/vars/<variable\_name>/size**

Defined on file *sysfs-secvar*

An integer representation of the size of the content of the variable. In other words, it represents the size of the data.

---

**/sys/firmware/secvar/vars/<variable\_name>/update**

Defined on file *sysfs-secvar*

A write-only file that is used to submit the new value for the variable. The size of the file represents the maximum size of the variable data that can be written.

---

**/sys/firmware/sfi/tables/**

Defined on file *sysfs-firmware-sfi*

SFI defines a number of small static memory tables so the kernel can get platform information from firmware.

The tables are defined in the latest SFI specification: <http://simplefirmware.org/documentation>

While the tables are used by the kernel, user-space can observe them this way:

```
# cd /sys/firmware/sfi/tables  
# cat $TABLENAME > $TABLENAME.bin
```

### **/sys/firmware/sgi\_uv/**

Defined on file [sysfs-firmware-sgi\\_uv](#)

The /sys/firmware/sgi\_uv directory contains information about the SGI UV platform.

Under that directory are a number of files:

```
partition_id  
coherence_id
```

The partition\_id entry contains the partition id. SGI UV systems can be partitioned into multiple physical machines, which each partition running a unique copy of the operating system. Each partition will have a unique partition id. To display the partition id, use the command:

```
cat /sys/firmware/sgi_uv/partition_id
```

The coherence\_id entry contains the coherence id. A partitioned SGI UV system can have one or more coherence domain. The coherence id indicates which coherence domain this partition is in. To display the coherence id, use the command:

```
cat /sys/firmware/sgi_uv/coherence_id
```

### **/sys/firmware/turris-mox-rwtmp/board\_version**

Defined on file [sysfs-firmware-turris-mox-rwtmp](#)

(Read) Board version burned into eFuses of this Turris Mox board. Format: %i

### **/sys/firmware/turris-mox-rwtmp/mac\_address\***

Defined on file [sysfs-firmware-turris-mox-rwtmp](#)

(Read) MAC addresses burned into eFuses of this Turris Mox board. Format: %pM

### **/sys/firmware/turris-mox-rwtmp/pubkey**

Defined on file [sysfs-firmware-turris-mox-rwtmp](#)

(Read) ECDSA public key (in pubkey hex compressed form) computed as pair to the ECDSA private key burned into eFuses of this Turris Mox Board. Format: string

---

**/sys/firmware/turris-mox-rwtm/ram\_size**

---

Defined on file *sysfs-firmware-turris-mox-rwtm*

(Read) RAM size in MiB of this Turris Mox board as was detected during manufacturing and burned into eFuses. Can be 512 or 1024. Format: %i

---

**/sys/firmware/turris-mox-rwtm/serial\_number**

---

Defined on file *sysfs-firmware-turris-mox-rwtm*

(Read) Serial number burned into eFuses of this Turris Mox device. Format: %016X

### 5.2.24 Symbols under /sys/fs

---

**/sys/fs/ext4/<disk>/delayed\_allocation\_blocks**

---

Defined on file *sysfs-fs-ext4*

This file is read-only and shows the number of blocks that are dirty in the page cache, but which do not have their location in the filesystem allocated yet.

---

**/sys/fs/ext4/<disk>/extent\_max\_zeroout\_kb**

---

Defined on file *sysfs-fs-ext4*

The maximum number of kilobytes which will be zeroed out in preference to creating a new uninitialized extent when manipulating an inode's extent tree. Note that using a larger value will increase the variability of time necessary to complete a random write operation (since a 4k random write might turn into a much larger write due to the zeroout operation).

---

**/sys/fs/ext4/<disk>/inode\_goal**

---

Defined on file *sysfs-fs-ext4*

Tuning parameter which (if non-zero) controls the goal inode used by the inode allocator in preference to all other allocation heuristics. This is intended for debugging use only, and should be 0 on production systems.

---

**/sys/fs/ext4/<disk>/inode\_readahead\_blk**

---

Defined on file *sysfs-fs-ext4*

Tuning parameter which controls the maximum number of inode table blocks that ext4's inode table readahead algorithm will pre-read into the buffer cache

### **/sys/fs/ext4/<disk>/journal\_task**

Defined on file *sysfs-fs-ext4*

This file is read-only and shows the pid of journal thread in current pid-namespace or 0 if task is unreachable.

### **/sys/fs/ext4/<disk>/lifetime\_write\_kbytes**

Defined on file *sysfs-fs-ext4*

This file is read-only and shows the number of kilobytes of data that have been written to this filesystem since it was created.

### **/sys/fs/ext4/<disk>/max\_writeback\_mb\_bump**

Defined on file *sysfs-fs-ext4*

The maximum number of megabytes the writeback code will try to write out before move on to another inode.

### **/sys/fs/ext4/<disk>/mb\_group\_prealloc**

Defined on file *sysfs-fs-ext4*

The multiblock allocator will round up allocation requests to a multiple of this tuning parameter if the stripe size is not set in the ext4 superblock

### **/sys/fs/ext4/<disk>/mb\_max\_to\_scan**

Defined on file *sysfs-fs-ext4*

The maximum number of extents the multiblock allocator will search to find the best extent

### **/sys/fs/ext4/<disk>/mb\_min\_to\_scan**

Defined on file *sysfs-fs-ext4*

The minimum number of extents the multiblock allocator will search to find the best extent

### **/sys/fs/ext4/<disk>/mb\_order2\_req**

Defined on file *sysfs-fs-ext4*

Tuning parameter which controls the minimum size for requests (as a power of 2) where the buddy cache is used

---

**/sys/fs/ext4/<disk>/mb\_stats**

---

Defined on file *sysfs-fs-ext4*

Controls whether the multiblock allocator should collect statistics, which are shown during the unmount. 1 means to collect statistics, 0 means not to collect statistics

---

**/sys/fs/ext4/<disk>/mb\_stream\_req**

---

Defined on file *sysfs-fs-ext4*

Files which have fewer blocks than this tunable parameter will have their blocks allocated out of a block group specific preallocation pool, so that small files are packed closely together. Each large file will have its blocks allocated out of its own unique preallocation pool.

---

**/sys/fs/ext4/<disk>/session\_write\_kbytes**

---

Defined on file *sysfs-fs-ext4*

This file is read-only and shows the number of kilobytes of data that have been written to this filesystem since it was mounted.

---

**/sys/fs/f2fs/<disk>/avg\_vblocks**

---

Defined on file *sysfs-fs-f2fs*

Average number of valid blocks. Available when CONFIG\_F2FS\_STAT\_FS=y.

---

**/sys/fs/f2fs/<disk>/batched\_trim\_sections**

---

Defined on file *sysfs-fs-f2fs*

Controls the trimming rate in batch mode. <deprecated>

---

**/sys/fs/f2fs/<disk>/cp\_background\_calls**

---

Defined on file *sysfs-fs-f2fs*

Number of checkpoint operations performed in the background to free segments. Available when CONFIG\_F2FS\_STAT\_FS=y.

---

**/sys/fs/f2fs/<disk>/cp\_foreground\_calls**

---

Defined on file *sysfs-fs-f2fs*

Number of checkpoint operations performed on demand. Available when CONFIG\_F2FS\_STAT\_FS=y.

**/sys/fs/f2fs/<disk>/cp\_interval**

Defined on file *sysfs-fs-f2fs*

Controls the checkpoint timing, set to 60 seconds by default.

**/sys/fs/f2fs/<disk>/current\_reserved\_blocks**

Defined on file *sysfs-fs-f2fs*

Shows current reserved blocks in system, it may be temporarily smaller than target\_reserved\_blocks, but will gradually increase to target\_reserved\_blocks when more free blocks are freed by user later.

**/sys/fs/f2fs/<disk>/data\_io\_flag**

Defined on file *sysfs-fs-f2fs*

Give a way to attach REQ\_META|FUA to data writes given temperature-based bits. Now the bits indicate:

REQ_META			REQ_FUA		
5	4	3	2	1	0
Cold	Warm	Hot	Cold	Warm	Hot

**/sys/fs/f2fs/<disk>/dir\_level**

Defined on file *sysfs-fs-f2fs*

Controls the directory level for large directory. If a directory has a number of files, it can reduce the file lookup latency by increasing this dir\_level value. Otherwise, it needs to decrease this value to reduce the space overhead. The default value is 0.

**/sys/fs/f2fs/<disk>/dirty\_nats\_ratio**

Defined on file *sysfs-fs-f2fs*

Controls dirty nat entries ratio threshold, if current ratio exceeds configured threshold, checkpoint will be triggered for flushing dirty nat entries.

**/sys/fs/f2fs/<disk>/dirty\_segments**

Defined on file *sysfs-fs-f2fs*

Shows the number of dirty segments.

---

### **/sys/fs/f2fs/<disk>/discard\_granularity**

---

Defined on file *sysfs-fs-f2fs*

Controls discard granularity of inner discard thread. Inner thread will not issue discards with size that is smaller than granularity. The unit size is one block(4KB), now only support configuring in range of [1, 512]. Default value is 4(=16KB).

---

### **/sys/fs/f2fs/<disk>/discard\_idle\_interval**

---

Defined on file *sysfs-fs-f2fs*

Controls the idle timing of discard thread given this time interval. Default is 5 secs.

---

### **/sys/fs/f2fs/<disk>/encoding**

---

Defined on file *sysfs-fs-f2fs*

Displays name and version of the encoding set for the filesystem. If no encoding is set, displays (none)

---

### **/sys/fs/f2fs/<disk>/extension\_list**

---

Defined on file *sysfs-fs-f2fs*

Used to control configure extension list: - Query: cat /sys/fs/f2fs/<disk>/extension\_list - Add: echo '[h/c]extension' > /sys/fs/f2fs/<disk>/extension\_list - Del: echo '[h/c]!extension' > /sys/fs/f2fs/<disk>/extension\_list - [h] means add/del hot file extension - [c] means add/del cold file extension

---

### **/sys/fs/f2fs/<disk>/features**

---

Defined on file *sysfs-fs-f2fs*

Shows all enabled features in current device.

---

### **/sys/fs/f2fs/<disk>/free\_segments**

---

Defined on file *sysfs-fs-f2fs*

Number of free segments in disk.

---

### **/sys/fs/f2fs/<disk>/gc\_background\_calls**

---

Defined on file *sysfs-fs-f2fs*

Number of garbage collection operations triggered in background. Available when CONFIG\_F2FS\_STAT\_FS=y.

### **/sys/fs/f2fs/<disk>/gc\_foreground\_calls**

Defined on file *sysfs-fs-f2fs*

Number of garbage collection operations performed on demand. Available when CONFIG\_F2FS\_STAT\_FS=y.

### **/sys/fs/f2fs/<disk>/gc\_idle**

Defined on file *sysfs-fs-f2fs*

Controls the victim selection policy for garbage collection. Setting gc\_idle = 0(default) will disable this option. Setting:

gc_idle = 1	will select the Cost Benefit approach & setting
gc_idle = 2	will select the greedy approach & setting
gc_idle = 3	will select the age-threshold based approach.

### **/sys/fs/f2fs/<disk>/gc\_idle\_interval**

Defined on file *sysfs-fs-f2fs*

Controls the idle timing for gc path. Set to 5 seconds by default.

### **/sys/fs/f2fs/<disk>/gc\_max\_sleep\_time**

Defined on file *sysfs-fs-f2fs*

Controls the maximum sleep time for gc\_thread. Time is in milliseconds.

### **/sys/fs/f2fs/<disk>/gc\_min\_sleep\_time**

Defined on file *sysfs-fs-f2fs*

Controls the minimum sleep time for gc\_thread. Time is in milliseconds.

### **/sys/fs/f2fs/<disk>/gc\_no\_gc\_sleep\_time**

Defined on file *sysfs-fs-f2fs*

Controls the default sleep time for gc\_thread. Time is in milliseconds.

### **/sys/fs/f2fs/<disk>/gc\_pin\_file\_thresh**

Defined on file *sysfs-fs-f2fs*

This indicates how many GC can be failed for the pinned file. If it exceeds this, F2FS doesn't guarantee its pinning state. 2048 trials is set by default.

**/sys/fs/f2fs/<disk>/gc\_urgent**

Defined on file *sysfs-fs-f2fs*

Do background GC aggressively when set. When `gc_urgent = 1`, background thread starts to do GC by given `gc_urgent_sleep_time` interval. When `gc_urgent = 2`, F2FS will lower the bar of checking idle in order to process outstanding discard commands and GC a little bit aggressively. It is set to 0 by default.

**/sys/fs/f2fs/<disk>/gc\_urgent\_sleep\_time**

Defined on file *sysfs-fs-f2fs*

Controls sleep time of GC urgent mode. Set to 500ms by default.

**/sys/fs/f2fs/<disk>/idle\_interval**

Defined on file *sysfs-fs-f2fs*

Controls the idle timing of system, if there is no FS operation during given interval. Set to 5 seconds by default.

**/sys/fs/f2fs/<disk>/inject\_rate**

Defined on file *sysfs-fs-f2fs*

Controls the injection rate of arbitrary faults.

**/sys/fs/f2fs/<disk>/inject\_type**

Defined on file *sysfs-fs-f2fs*

Controls the injection type of arbitrary faults.

**/sys/fs/f2fs/<disk>/iostat\_enable**

Defined on file *sysfs-fs-f2fs*

Controls to enable/disable IO stat.

**/sys/fs/f2fs/<disk>/iostat\_period\_ms**

Defined on file *sysfs-fs-f2fs*

Give a way to change iostat\_period time. 3secs by default. The new iostat trace gives stats gap given the period.

### **/sys/fs/f2fs/<disk>/ipu\_policy**

Defined on file *sysfs-fs-f2fs*

Controls the in-place-update policy. updates in f2fs. User can set:

0x01	F2FS_IPU_FORCE
0x02	F2FS_IPU_SSR
0x04	F2FS_IPU_UTIL
0x08	F2FS_IPU_SSR_UTIL
0x10	F2FS_IPU_FSYNC
0x20	F2FS_IPU_ASYNC,
0x40	F2FS_IPU_NOCACHE

Refer segment.h for details.

### **/sys/fs/f2fs/<disk>/lifetime\_write\_kbytes**

Defined on file *sysfs-fs-f2fs*

Shows total written kbytes issued to disk.

### **/sys/fs/f2fs/<disk>/main\_blkaddr**

Defined on file *sysfs-fs-f2fs*

Shows first block address of MAIN area.

### **/sys/fs/f2fs/<disk>/max\_small\_discards**

Defined on file *sysfs-fs-f2fs*

Controls the issue rate of discard commands that consist of small blocks less than 2MB. The candidates to be discarded are cached until checkpoint is triggered, and issued during the checkpoint. By default, it is disabled with 0.

### **/sys/fs/f2fs/<disk>/max\_victim\_search**

Defined on file *sysfs-fs-f2fs*

Controls the number of trials to find a victim segment when conducting SSR and cleaning operations. The default value is 4096 which covers 8GB block address range.

### **/sys/fs/f2fs/<disk>/migration\_granularity**

Defined on file *sysfs-fs-f2fs*

Controls migration granularity of garbage collection on large section, it can let GC move partial segment{s} of one section in one GC cycle, so that dispersing heavy overhead GC to multiple lightweight one.

---

**/sys/fs/f2fs/<disk>/min\_fsync\_blocks**

---

Defined on file *sysfs-fs-f2fs*

Controls the dirty page count condition for the in-place-update policies.

---

**/sys/fs/f2fs/<disk>/min\_hot\_blocks**

---

Defined on file *sysfs-fs-f2fs*

Controls the dirty page count condition for redefining hot data.

---

**/sys/fs/f2fs/<disk>/min\_ipu\_util**

---

Defined on file *sysfs-fs-f2fs*

Controls the FS utilization condition for the in-place-update policies. It is used by F2FS\_IPU\_UTIL and F2FS\_IPU\_SSR\_UTIL policies.

---

**/sys/fs/f2fs/<disk>/min\_seq\_blocks**

---

Defined on file *sysfs-fs-f2fs*

Controls the dirty page count condition for batched sequential writes in writepages.

---

**/sys/fs/f2fs/<disk>/min\_ssr\_sections**

---

Defined on file *sysfs-fs-f2fs*

Controls the free section threshold to trigger SSR allocation. If this is large, SSR mode will be enabled early.

---

**/sys/fs/f2fs/<disk>/mounted\_time\_sec**

---

Defined on file *sysfs-fs-f2fs*

Show the mounted time in secs of this partition.

---

**/sys/fs/f2fs/<disk>/moved\_blocks\_background**

---

Defined on file *sysfs-fs-f2fs*

Number of blocks moved by garbage collection in background. Available when CONFIG\_F2FS\_STAT\_FS=y.

### /sys/fs/f2fs/<disk>/moved\_blocks\_foreground

Defined on file *sysfs-fs-f2fs*

Number of blocks moved by garbage collection in foreground. Available when CONFIG\_F2FS\_STAT\_FS=y.

### /sys/fs/f2fs/<disk>/node\_io\_flag

Defined on file *sysfs-fs-f2fs*

Give a way to attach REQ\_META|FUA to node writes given temperature-based bits. Now the bits indicate:

REQ_META			REQ_FUA		
5	4	3	2	1	0
Cold	Warm	Hot	Cold	Warm	Hot

### /sys/fs/f2fs/<disk>/ra\_nid\_pages

Defined on file *sysfs-fs-f2fs*

Controls the count of nid pages to be readaheaded. When building free nids, F2FS reads NAT blocks ahead for speed up. Default is 0.

### /sys/fs/f2fs/<disk>/ram\_thresh

Defined on file *sysfs-fs-f2fs*

Controls the memory footprint used by free nids and cached nat entries. By default, 1 is set, which indicates 10 MB / 1 GB RAM.

### /sys/fs/f2fs/<disk>/readdir\_ra

Defined on file *sysfs-fs-f2fs*

Controls readahead inode block in readdir. Enabled by default.

### /sys/fs/f2fs/<disk>/reclaim\_segments

Defined on file *sysfs-fs-f2fs*

This parameter controls the number of prefree segments to be reclaimed. If the number of prefree segments is larger than the number of segments in the proportion to the percentage over total volume size, f2fs tries to conduct checkpoint

to reclaim the prefree segments to free segments. By default, 5% over total # of segments.

---

### **/sys/fs/f2fs/<disk>/reserved\_blocks**

---

Defined on file *sysfs-fs-f2fs*

Controls target reserved blocks in system, the threshold is soft, it could exceed current available user space.

---

### **/sys/fs/f2fs/<disk>/umount\_discard\_timeout**

---

Defined on file *sysfs-fs-f2fs*

Set timeout to issue discard commands during umount. Default: 5 secs

---

### **/sys/fs/f2fs/<disk>/unusable**

---

Defined on file *sysfs-fs-f2fs*

If checkpoint=disable, it displays the number of blocks that are unusable. If checkpoint=enable it displays the enumber of blocks that would be unusable if checkpoint=disable were to be set.

---

### **/sys/fs/nilfs2/<device>/README**

---

Defined on file *sysfs-fs-nilfs2*

Describe attributes of /sys/fs/nilfs2/<device> group.

---

### **/sys/fs/nilfs2/<device>/blocksize**

---

Defined on file *sysfs-fs-nilfs2*

Show volume' s block size in bytes.

---

### **/sys/fs/nilfs2/<device>/checkpoints/README**

---

Defined on file *sysfs-fs-nilfs2*

Describe attributes of /sys/fs/nilfs2/<device>/checkpoints group.

---

### **/sys/fs/nilfs2/<device>/checkpoints/checkpoints\_number**

---

Defined on file *sysfs-fs-nilfs2*

Show number of checkpoints on volume.

**/sys/fs/nilfs2/<device>/checkpoints/last\_seg\_checkpoint**

Defined on file *sysfs-fs-nilfs2*

Show checkpoint number of the latest segment.

**/sys/fs/nilfs2/<device>/checkpoints/next\_checkpoint**

Defined on file *sysfs-fs-nilfs2*

Show next checkpoint number.

**/sys/fs/nilfs2/<device>/checkpoints/snapshots\_number**

Defined on file *sysfs-fs-nilfs2*

Show number of snapshots on volume.

**/sys/fs/nilfs2/<device>/device\_size**

Defined on file *sysfs-fs-nilfs2*

Show volume size in bytes.

**/sys/fs/nilfs2/<device>/free\_blocks**

Defined on file *sysfs-fs-nilfs2*

Show count of free blocks on volume.

**/sys/fs/nilfs2/<device>/mounted\_snapshots/<id>/README**

Defined on file *sysfs-fs-nilfs2*

Describe attributes of /sys/fs/nilfs2/<device>/mounted\_snapshots/<id> group.

**/sys/fs/nilfs2/<device>/mounted\_snapshots/<id>/blocks\_count**

Defined on file *sysfs-fs-nilfs2*

Show number of blocks for snapshot.

**/sys/fs/nilfs2/<device>/mounted\_snapshots/<id>/inodes\_count**

Defined on file *sysfs-fs-nilfs2*

Show number of inodes for snapshot.

---

**/sys/fs/nilfs2/<device>/mounted\_snapshots/README**

---

Defined on file *sysfs-fs-nilfs2*

Describe content of /sys/fs/nilfs2/<device>/mounted\_snapshots group.

---

**/sys/fs/nilfs2/<device>/revision**

---

Defined on file *sysfs-fs-nilfs2*

Show NILFS file system revision on volume. This value informs about metadata structures' revision on mounted volume.

---

**/sys/fs/nilfs2/<device>/segctor/README**

---

Defined on file *sysfs-fs-nilfs2*

Describe attributes of /sys/fs/nilfs2/<device>/segctor group.

---

**/sys/fs/nilfs2/<device>/segctor/current\_last\_full\_seg**

---

Defined on file *sysfs-fs-nilfs2*

Show index number of the latest full segment.

---

**/sys/fs/nilfs2/<device>/segctor/current\_seg\_sequence**

---

Defined on file *sysfs-fs-nilfs2*

Show segment sequence counter.

---

**/sys/fs/nilfs2/<device>/segctor/dirty\_data\_blocks\_count**

---

Defined on file *sysfs-fs-nilfs2*

Show number of dirty data blocks.

---

**/sys/fs/nilfs2/<device>/segctor/last\_nongc\_write\_time**

---

Defined on file *sysfs-fs-nilfs2*

Show write time of the last segment not for cleaner operation in human-readable format.

---

**/sys/fs/nilfs2/<device>/segctor/last\_nongc\_write\_time\_secs**

---

Defined on file *sysfs-fs-nilfs2*

Show write time of the last segment not for cleaner operation in seconds.

**/sys/fs/nilfs2/<device>/segctor/last\_pseg\_block**

Defined on file *sysfs-fs-nilfs2*

Show start block number of the latest segment.

**/sys/fs/nilfs2/<device>/segctor/last\_seg\_checkpoint**

Defined on file *sysfs-fs-nilfs2*

Show checkpoint number of the latest segment.

**/sys/fs/nilfs2/<device>/segctor/last\_seg\_sequence**

Defined on file *sysfs-fs-nilfs2*

Show sequence value of the latest segment.

**/sys/fs/nilfs2/<device>/segctor/last\_seg\_write\_time**

Defined on file *sysfs-fs-nilfs2*

Show write time of the last segment in human-readable format.

**/sys/fs/nilfs2/<device>/segctor/last\_seg\_write\_time\_secs**

Defined on file *sysfs-fs-nilfs2*

Show write time of the last segment in seconds.

**/sys/fs/nilfs2/<device>/segctor/next\_checkpoint**

Defined on file *sysfs-fs-nilfs2*

Show next checkpoint number.

**/sys/fs/nilfs2/<device>/segctor/next\_full\_seg**

Defined on file *sysfs-fs-nilfs2*

Show index number of the full segment index to be used next.

**/sys/fs/nilfs2/<device>/segctor/next\_pseg\_offset**

Defined on file *sysfs-fs-nilfs2*

Show offset of next partial segment in the current full segment.

---

### **/sys/fs/nilfs2/<device>/segments/README**

---

Defined on file *sysfs-fs-nilfs2*

Describe attributes of /sys/fs/nilfs2/<device>/segments group.

---

### **/sys/fs/nilfs2/<device>/segments/blocks\_per\_segment**

---

Defined on file *sysfs-fs-nilfs2*

Show number of blocks in segment.

---

### **/sys/fs/nilfs2/<device>/segments/clean\_segments**

---

Defined on file *sysfs-fs-nilfs2*

Show count of clean segments.

---

### **/sys/fs/nilfs2/<device>/segments/dirty\_segments**

---

Defined on file *sysfs-fs-nilfs2*

Show count of dirty segments.

---

### **/sys/fs/nilfs2/<device>/segments/segments\_number**

---

Defined on file *sysfs-fs-nilfs2*

Show number of segments on a volume.

---

### **/sys/fs/nilfs2/<device>/superblock/README**

---

Defined on file *sysfs-fs-nilfs2*

Describe attributes of /sys/fs/nilfs2/<device>/superblock group.

---

### **/sys/fs/nilfs2/<device>/superblock/sb\_update\_frequency**

---

Defined on file *sysfs-fs-nilfs2*

Show/Set interval of periodical update of superblock (in seconds).

---

### **/sys/fs/nilfs2/<device>/superblock/sb\_write\_count**

---

Defined on file *sysfs-fs-nilfs2*

Show current write count of super block.

**/sys/fs/nilfs2/<device>/superblock/sb\_write\_time**

Defined on file *sysfs-fs-nilfs2*

Show last write time of super block in human-readable format.

**/sys/fs/nilfs2/<device>/superblock/sb\_write\_time\_secs**

Defined on file *sysfs-fs-nilfs2*

Show last write time of super block in seconds.

**/sys/fs/nilfs2/<device>/uuid**

Defined on file *sysfs-fs-nilfs2*

Show volume's UUID (Universally Unique Identifier).

**/sys/fs/nilfs2/<device>/volume\_name**

Defined on file *sysfs-fs-nilfs2*

Show volume's label.

**/sys/fs/nilfs2/features/README**

Defined on file *sysfs-fs-nilfs2*

Describe attributes of /sys/fs/nilfs2/features group.

**/sys/fs/nilfs2/features/revision**

Defined on file *sysfs-fs-nilfs2*

Show current revision of NILFS file system driver. This value informs about file system revision that driver is ready to support.

**/sys/fs/ocfs2/**

Defined on file *sysfs-ocfs2*

The /sys/fs/ocfs2 directory contains knobs used by the ocfs2-tools to interact with the filesystem.

**/sys/fs/ocfs2/active\_cluster\_plugin**

Defined on file *sysfs-ocfs2*

The */sys/fs/ocfs2/active\_cluster\_plugin* displays which cluster plugin is currently in use by the filesystem. The active plugin will appear in the *loaded\_cluster\_plugins* file as well. Only one plugin can be used at a time.

Reading from this file returns the name of the active plugin on a single line.

This file is read-only. Which plugin is active depends on the cluster stack in use. The contents may change when all filesystems are unmounted and the cluster stack is changed.

### **/sys/fs/ocfs2/cluster\_stack**

Defined on file *sysfs-ocfs2*

The */sys/fs/ocfs2/cluster\_stack* file contains the name of current ocfs2 cluster stack. This value is set by userspace tools when bringing the cluster stack online.

Cluster stack names are 4 characters in length.

When the ‘o2cb’ cluster stack is used, the ‘o2cb’ cluster plugin is active. All other cluster stacks use the ‘user’ cluster plugin.

Reading from this file returns the name of the current cluster stack on a single line.

Writing a new stack name to this file changes the current cluster stack unless there are mounted ocfs2 filesystems. If there are mounted filesystems, attempts to change the stack return an error.

Users:

ocfs2-tools <ocfs2-tools-devel@oss.oracle.com>

### **/sys/fs/ocfs2/loaded\_cluster\_plugins**

Defined on file *sysfs-ocfs2*

The */sys/fs/ocfs2/loaded\_cluster\_plugins* file describes the available plugins to support ocfs2 cluster operation. A cluster plugin is required to use ocfs2 in a cluster. There are currently two available plugins:

- **‘o2cb’ - The classic o2cb cluster stack that ocfs2 has used since its inception.**
- **‘user’ - A plugin supporting userspace cluster software in conjunction with fs/dlm.**

Reading from this file returns the names of all loaded plugins, one per line.

This file is read-only. Its contents may change as plugins are loaded or removed.

### **/sys/fs/ocfs2/max\_locking\_protocol**

Defined on file *sysfs-ocfs2*

The */sys/fs/ocfs2/max\_locking\_protocol* file displays version of ocfs2 locking supported by the filesystem. This version covers how ocfs2 uses distributed locking between cluster nodes.

The protocol version has a major and minor number. Two cluster nodes can interoperate if they have an identical major number and an overlapping minor number - thus, a node with version 1.10 can interoperate with a node sporting version 1.8, as long as both use the 1.8 protocol.

Reading from this file returns a single line, the major number and minor number joined by a period, eg “1.10” .

This file is read-only. The value is compiled into the driver.

**/sys/fs/pstore/…(or /dev/pstore/…)**

Defined on file *pstore*

Generic interface to platform dependent persistent storage.

Platforms that provide a mechanism to preserve some data across system reboots can register with this driver to provide a generic interface to show records captured in the dying moments. In the case of a panic the last part of the console log is captured, but other interesting data can also be saved:

```
# mount -t pstore -o kmsg_bytes=8000 - /sys/fs/pstore  
  
$ ls -l /sys/fs/pstore/  
total 0  
-r--r--r-- 1 root root 7896 Nov 30 15:38 dmesg-erst-1
```

Different users of this interface will result in different filename prefixes. Currently two are defined:

- “dmesg” - saved console log
- “mce” - architecture dependent data from fatal h/w error

Once the information in a file has been read, removing the file will signal to the underlying persistent storage device that it can reclaim the space for later re-use:

```
$ rm /sys/fs/pstore/dmesg-erst-1
```

The expectation is that all files in */sys/fs/pstore/* will be saved elsewhere and erased from persistent store soon after boot to free up space ready for the next catastrophe.

The ‘kmsg\_bytes’ mount option changes the target amount of data saved on each oops/panic. Pstore saves (possibly multiple) files based on the record size of the underlying persistent storage until at least this amount is reached. Default is 10 Kbytes.

Pstore only supports one backend at a time. If multiple backends are available, the preferred backend may be set by passing the *pstore.backend=* argument to the kernel at boot time.

---

**/sys/fs/xfs/<disk>/log/log\_head\_lsn**

Defined on file *sysfs-fs-xfs*

The log sequence number (LSN) of the current head of the log. The LSN is exported in “cycle:basic block” format.

Users: xfstests

---

**/sys/fs/xfs/<disk>/log/log\_tail\_lsn**

Defined on file *sysfs-fs-xfs*

The log sequence number (LSN) of the current tail of the log. The LSN is exported in “cycle:basic block” format.

---

**/sys/fs/xfs/<disk>/log/reserve\_grant\_head**

Defined on file *sysfs-fs-xfs*

The current state of the log reserve grant head. It represents the total log reservation of all currently outstanding transactions. The grant head is exported in “cycle:bytes” format.

Users: xfstests

---

**/sys/fs/xfs/<disk>/log/write\_grant\_head**

Defined on file *sysfs-fs-xfs*

The current state of the log write grant head. It represents the total log reservation of all currently outstanding transactions, including regrants due to rolling transactions. The grant head is exported in “cycle:bytes” format.

Users: xfstests

## 5.2.25 Symbols under /sys/hypervisor

---

**/sys/hypervisor/guest\_type**

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Type of guest: “Xen” : standard guest type on arm “HVM” : fully virtualized guest (x86) “PV” : paravirtualized guest (x86) “PVH” : fully virtualized guest without legacy emulation (x86)

---

**/sys/hypervisor/pmu/pmu\_features**

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Describes Xen PMU features (as an integer). A set bit indicates that the corresponding feature is enabled. See include/xen/interface/xenpmu.h for available features

### /sys/hypervisor/pmu/pmu\_mode

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Describes mode that Xen’s performance-monitoring unit (PMU) uses. Accepted values are:

- “off” PMU is disabled
- “self” The guest can profile itself
- “hv” The guest can profile itself and, if it is privileged (e.g. dom0), the hypervisor
- “all” The guest can profile itself, the hypervisor and all other guests. Only available to privileged guests.

### /sys/hypervisor/properties/buildid

Defined on file *sysfs-hypervisor-xen*

If running under Xen: Build id of the hypervisor, needed for hypervisor live patching. Might return “<denied>” in case of special security settings in the hypervisor.

## 5.2.26 Symbols under /sys/kernel

### /sys/kernel/boot\_params

Defined on file *sysfs-kernel-boot\_params*

The */sys/kernel/boot\_params* directory contains two files: “data” and “version” and one subdirectory “setup\_data”. It is used to export the kernel boot parameters of an x86 platform to userspace for kexec and debugging purpose.

If there’s no setup\_data in boot\_params the subdirectory will not be created.

“data” file is the binary representation of struct boot\_params.

“version” file is the string representation of boot protocol version.

“setup\_data” subdirectory contains the setup\_data data structure in boot\_params. setup\_data is maintained in kernel as a link list. In “setup\_data” subdirectory there’s one subdirectory for each link list node named with the number of the list nodes. The list node subdirectory contains two files “type” and “data”. “type” file is the string representation of setup\_data type. “data” file is the binary representation of setup\_data payload.

The whole boot\_params directory structure is like below:

```
:ref:`\sys\kernel\boot_params <abi_sys_kernel_boot_params>`  

|__ data  

|__ setup_data  

|   |__ 0  

|   |   |__ data  

|   |   |__ type  

|   |__ 1  

|   |   |__ data  

|   |   |__ type  

|__ version
```

Users: Kexec

### /sys/kernel/btf

Defined on file *sysfs-kernel-btf*

Contains BTF type information and related data for kernel and kernel modules.

### /sys/kernel/btf/vmlinux

Defined on file *sysfs-kernel-btf*

Read-only binary attribute exposing kernel's own BTF type information with description of all internal kernel types. See /bpf/btf for detailed description of format itself.

### /sys/kernel/config/most\_<component>

Defined on file *configfs-most*

Interface is used to configure and connect device channels to component drivers.

Attributes are visible only when configfs is mounted. To mount configfs in /sys/kernel/config directory use: # mount -t configfs none /sys/kernel/config/

### /sys/kernel/config/most\_cdev/<link>

Defined on file *configfs-most*

The attributes:

#### **buffer\_size**

configure the buffer size for this channel

#### **subbuffer\_size**

configure the sub-buffer size for this channel (needed for synchronous and isochronous data)

#### **num\_buffers**

configure number of buffers used for this channel

**datatype**

configure type of data that will travel over this channel

**direction**

configure whether this link will be an input or output

**dbr\_size**

configure DBR data buffer size (this is used for MediaLB communication only)

**packets\_per\_xact**

configure the number of packets that will be collected from the network before being transmitted via USB (this is used for USB communication only)

**device**

name of the device the link is to be attached to

**channel**

name of the channel the link is to be attached to

**comp\_params**

pass parameters needed by some components

**create\_link**

write ‘1’ to this attribute to trigger the creation of the link. In case of speculative configuration, the creation is post-poned until a physical device is being attached to the bus.

**destroy\_link**

write ‘1’ to this attribute to destroy an active link

---

**/sys/kernel/config/most\_net/<link>**

---

Defined on file *configfs-most*

The attributes:

**buffer\_size**

configure the buffer size for this channel

**subbuffer\_size**

configure the sub-buffer size for this channel (needed for synchronous and isochrnsous data)

**num\_buffers**

configure number of buffers used for this channel

**datatype**

configure type of data that will travel over this channel

**direction**

configure whether this link will be an input or output

**dbr\_size**

configure DBR data buffer size (this is used for MediaLB communication only)

**packets\_per\_xact**

configure the number of packets that will be collected from the network before being transmitted via USB (this is used for USB communication only)

**device**

name of the device the link is to be attached to

**channel**

name of the channel the link is to be attached to

**comp\_params**

pass parameters needed by some components

**create\_link**

write ‘1’ to this attribute to trigger the creation of the link. In case of speculative configuration, the creation is post-poned until a physical device is being attached to the bus.

**destroy\_link**

write ‘1’ to this attribute to destroy an active link

---

**/sys/kernel/config/most\_sound/<card>**

---

Defined on file *configfs-most*

The attributes:

**create\_card**

write ‘1’ to this attribute to trigger the registration of the sound card with the ALSA subsystem.

---

**/sys/kernel/config/most\_sound/<card>/<link>**

---

Defined on file *configfs-most*

The attributes:

**buffer\_size**

configure the buffer size for this channel

**subbuffer\_size**

configure the sub-buffer size for this channel (needed for synchronous and isochrnsous data)

**num\_buffers**

configure number of buffers used for this channel

**datatype**

configure type of data that will travel over this channel

**direction**

configure whether this link will be an input or output

**dbr\_size**

configure DBR data buffer size (this is used for MediaLB communication only)

**packets\_per\_xact**

configure the number of packets that will be collected from the network before being transmitted via USB (this is used for USB communication only)

**device**

name of the device the link is to be attached to

**channel**

name of the channel the link is to be attached to

**comp\_params**

pass parameters needed by some components

**create\_link**

write ‘1’ to this attribute to trigger the creation of the link. In case of speculative configuration, the creation is post-poned until a physical device is being attached to the bus.

**destroy\_link**

write ‘1’ to this attribute to destroy an active link

---

**/sys/kernel/config/most\_video/<link>**

---

Defined on file *configfs-most*

The attributes:

**buffer\_size**

configure the buffer size for this channel

**subbuffer\_size**

configure the sub-buffer size for this channel (needed for synchronous and isochnous data)

**num\_buffers**

configure number of buffers used for this channel

**datatype**

configure type of data that will travel over this channel

**direction**

configure whether this link will be an input or output

**dbr\_size**

configure DBR data buffer size (this is used for MediaLB communication only)

**packets\_per\_xact**

configure the number of packets that will be collected from the network before being transmitted via USB (this is used for USB communication only)

**device**

name of the device the link is to be attached to

**channel**

name of the channel the link is to be attached to

**comp\_params**

pass parameters needed by some components

**create\_link**

write ‘1’ to this attribute to trigger the creation of the link. In case of specula-

tive configuration, the creation is post-poned until a physical device is being attached to the bus.

### **destroy\_link**

write ‘1’ to this attribute to destroy an active link

---

**/sys/kernel/debug/<cros-ec-device>/console\_log**

---

Defined on file *debugfs-cros-ec*

If the EC supports the CONSOLE\_READ command type, this file can be used to grab the EC logs. The kernel polls for the log and keeps its own buffer but userspace should grab this and write it out to some logs.

---

**/sys/kernel/debug/<cros-ec-device>/last\_resume\_result**

---

Defined on file *debugfs-cros-ec*

Some ECs have a feature where they will track transitions to the (Intel) processor’s SLP\_S0 line, in order to detect cases where a system failed to go into S0ix. When the system resumes, an EC with this feature will return a summary of SLP\_S0 transitions that occurred. The last\_resume\_result file returns the most recent response from the AP’s resume message to the EC.

The bottom 31 bits contain a count of the number of SLP\_S0 transitions that occurred since the suspend message was received. Bit 31 is set if the EC attempted to wake the system due to a timeout when watching for SLP\_S0 transitions. Callers can use this to detect a wake from the EC due to S0ix timeouts. The result will be zero if no suspend transitions have been attempted, or the EC does not support this feature.

Output will be in the format: “0x%08xn” .

---

**/sys/kernel/debug/<cros-ec-device>/panicinfo**

---

Defined on file *debugfs-cros-ec*

This file dumps the EC panic information from the previous reboot. This file will only exist if the PANIC\_INFO command type is supported by the EC.

---

**/sys/kernel/debug/<cros-ec-device>/pdinfo**

---

Defined on file *debugfs-cros-ec*

This file provides the port role, muxes and power debug information for all the USB PD/type-C ports available. If there are no ports available, this file will be just an empty file.

---

**/sys/kernel/debug/<cros-ec-device>/uptime**

---

Defined on file *debugfs-cros-ec*

A u32 providing the time since EC booted in ms. This is used for synchronizing the AP host time with the EC log. An error is returned if the command is not supported by the EC or there is a communication problem.

### /sys/kernel/debug/cec/\*/error-inj

Defined on file [debugfs-cec-error-inj](#)

The CEC Framework allows for CEC error injection commands through debugfs. Drivers that support this will create an error-inj file through which the error injection commands can be given.

The basic syntax is as follows:

Leading spaces/tabs are ignored. If the next character is a ‘#’ or the end of the line was reached, then the whole line is ignored. Otherwise a command is expected.

It is up to the driver to decide what commands to implement. The only exception is that the command ‘clear’ without any arguments must be implemented and that it will remove all current error injection commands.

This ensures that you can always do ‘echo clear >error-inj’ to clear any error injections without having to know the details of the driver-specific commands.

Note that the output of ‘error-inj’ shall be valid as input to ‘error-inj’ . So this must work:

```
$ cat error-inj >einq.txt  
$ cat einq.txt >error-inj
```

Other than these basic rules described above this ABI is not considered stable and may change in the future.

Drivers that implement this functionality must document the commands as part of the CEC documentation and must keep that documentation up to date when changes are made.

The following CEC error injection implementations exist:

- /userspace-api/media/cec/cec-pin-error-inj

### /sys/kernel/debug/ec/\*/{gpe,use\_global\_lock,io}

Defined on file [debugfs-ec](#)

General information like which GPE is assigned to the EC and whether the global lock should get used. Knowing the EC GPE one can watch the amount of HW events related to the EC here (XY -> GPE number from `/sys/kernel/debug/ec/*/{gpe}`): `/sys/firmware/acpi/interrupts/gpeXY`

The io file is binary and a userspace tool located here: <ftp://ftp.suse.com/pub/people/trenn/sources/ec/> should get used to read out the 256 Embedded Controller registers or writing to them.

#### **CAUTION:**

Do not write to the Embedded Controller if you don’t know what you are

doing! Rebooting afterwards also is a good idea. This can influence the way your machine is cooled and fans may not get switched on again after you did a wrong write.

---

**/sys/kernel/debug/genwqe/genwqe<n>\_card/curr\_dbg\_uid0**

Defined on file *debugfs-driver-genwqe*

Internal chip state of UID0 (unit id 0). Only available for PF.

---

**/sys/kernel/debug/genwqe/genwqe<n>\_card/curr\_dbg\_uid1**

Defined on file *debugfs-driver-genwqe*

Internal chip state of UID1. Only available for PF.

---

**/sys/kernel/debug/genwqe/genwqe<n>\_card/curr\_dbg\_uid2**

Defined on file *debugfs-driver-genwqe*

Internal chip state of UID2. Only available for PF.

---

**/sys/kernel/debug/genwqe/genwqe<n>\_card/curr\_regs**

Defined on file *debugfs-driver-genwqe*

Dump of the current error registers. Only available for PF.

---

**/sys/kernel/debug/genwqe/genwqe<n>\_card/ddcb\_info**

Defined on file *debugfs-driver-genwqe*

DDCB queue dump used for debugging queueing problems.

---

**/sys/kernel/debug/genwqe/genwqe<n>\_card/err\_inject**

Defined on file *debugfs-driver-genwqe*

Possibility to inject error cases to ensure that the drivers error handling code works well.

---

**/sys/kernel/debug/genwqe/genwqe<n>\_card/info**

Defined on file *debugfs-driver-genwqe*

Comprehensive summary of bitstream version and software version. Used bitstream and bitstream clocking information.

### **/sys/kernel/debug/genwqe/genwqe<n>\_card/jobtimer**

Defined on file *debugfs-driver-genwqe*

Dump job timeout register values for PF and VFs. Only available for PF.

### **/sys/kernel/debug/genwqe/genwqe<n>\_card/prev\_dbg\_uid0**

Defined on file *debugfs-driver-genwqe*

Internal chip state of UID0 before card was reset. Only available for PF.

### **/sys/kernel/debug/genwqe/genwqe<n>\_card/prev\_dbg\_uid1**

Defined on file *debugfs-driver-genwqe*

Internal chip state of UID1 before card was reset. Only available for PF.

### **/sys/kernel/debug/genwqe/genwqe<n>\_card/prev\_dbg\_uid2**

Defined on file *debugfs-driver-genwqe*

Internal chip state of UID2 before card was reset. Only available for PF.

### **/sys/kernel/debug/genwqe/genwqe<n>\_card/prev\_regs**

Defined on file *debugfs-driver-genwqe*

Dump of the error registers before the last reset of the card occurred. Only available for PF.

### **/sys/kernel/debug/genwqe/genwqe<n>\_card/queue\_working\_time**

Defined on file *debugfs-driver-genwqe*

Dump queue working time register values for PF and VFs. Only available for PF.

### **/sys/kernel/debug/genwqe/genwqe<n>\_card/vf<0..14>\_jobtimeout\_msec**

Defined on file *debugfs-driver-genwqe*

Default VF timeout 250ms. Testing might require 1000ms. Using 0 will use the cards default value (whatever that is).

The timeout depends on the max number of available cards in the system and the maximum allowed queue size.

The driver ensures that the settings are done just before the VFs get enabled. Changing the timeouts in flight is not possible. Only available for PF.

**/sys/kernel/debug/habanalabs/hl<n>/addr**

Defined on file *debugfs-driver-habanalabs*

Sets the device address to be used for read or write through PCI bar, or the device VA of a host mapped memory to be read or written directly from the host. The latter option is allowed only when the IOMMU is disabled. The acceptable value is a string that starts with “0x”

**/sys/kernel/debug/habanalabs/hl<n>/clk\_gate**

Defined on file *debugfs-driver-habanalabs*

Allow the root user to disable/enable in runtime the clock gating mechanism in Gaudi. Due to how Gaudi is built, the clock gating needs to be disabled in order to access the registers of the TPC and MME engines. This is sometimes needed during debug by the user and hence the user needs this option. The user can supply a bitmask value, each bit represents a different engine to disable/enable its clock gating feature. The bitmask is composed of 20 bits:

0 - 7	DMA channels
8 - 11	MME engines
12 - 19	TPC engines

The bit’s location of a specific engine can be determined using  $(1 << \text{GAUDI\_ENGINE\_ID\_}* )$ . GAUDI\_ENGINE\_ID\_\* values are defined in uapi habanalabs.h file in enum gaudi\_engine\_id

**/sys/kernel/debug/habanalabs/hl<n>/command\_buffers**

Defined on file *debugfs-driver-habanalabs*

Displays a list with information about the currently allocated command buffers

**/sys/kernel/debug/habanalabs/hl<n>/command\_submission**

Defined on file *debugfs-driver-habanalabs*

Displays a list with information about the currently active command submissions

**/sys/kernel/debug/habanalabs/hl<n>/command\_submission\_jobs**

Defined on file *debugfs-driver-habanalabs*

Displays a list with detailed information about each JOB (CB) of each active command submission

**/sys/kernel/debug/habanalabs/hl<n>/data32**

Defined on file *debugfs-driver-habanalabs*

Allows the root user to read or write directly through the device' s PCI bar. Writing to this file generates a write transaction while reading from the file generates a read transaction. This custom interface is needed (instead of using the generic Linux user-space PCI mapping) because the DDR bar is very small compared to the DDR memory and only the driver can move the bar before and after the transaction.

If the IOMMU is disabled, it also allows the root user to read or write from the host a device VA of a host mapped memory

---

### **/sys/kernel/debug/habanalabs/hl<n>/data64**

---

Defined on file *debugfs-driver-habanalabs*

Allows the root user to read or write 64 bit data directly through the device' s PCI bar. Writing to this file generates a write transaction while reading from the file generates a read transaction. This custom interface is needed (instead of using the generic Linux user-space PCI mapping) because the DDR bar is very small compared to the DDR memory and only the driver can move the bar before and after the transaction.

If the IOMMU is disabled, it also allows the root user to read or write from the host a device VA of a host mapped memory

---

### **/sys/kernel/debug/habanalabs/hl<n>/device**

---

Defined on file *debugfs-driver-habanalabs*

Enables the root user to set the device to specific state. Valid values are “disable” , “enable” , “suspend” , “resume” . User can read this property to see the valid values

---

### **/sys/kernel/debug/habanalabs/hl<n>/engines**

---

Defined on file *debugfs-driver-habanalabs*

Displays the status registers values of the device engines and their derived idle status

---

### **/sys/kernel/debug/habanalabs/hl<n>/i2c\_addr**

---

Defined on file *debugfs-driver-habanalabs*

Sets I2C device address for I2C transaction that is generated by the device' s CPU

---

### **/sys/kernel/debug/habanalabs/hl<n>/i2c\_bus**

---

Defined on file *debugfs-driver-habanalabs*

Sets I2C bus address for I2C transaction that is generated by the device' s CPU

---

### **/sys/kernel/debug/habanalabs/hl<n>/i2c\_data**

---

Defined on file *debugfs-driver-habanalabs*

Triggers an I2C transaction that is generated by the device's CPU. Writing to this file generates a write transaction while reading from the file generates a read transaction

---

### **/sys/kernel/debug/habanalabs/hl<n>/i2c\_reg**

---

Defined on file *debugfs-driver-habanalabs*

Sets I2C register id for I2C transaction that is generated by the device's CPU

---

### **/sys/kernel/debug/habanalabs/hl<n>/led0**

---

Defined on file *debugfs-driver-habanalabs*

Sets the state of the first S/W led on the device

---

### **/sys/kernel/debug/habanalabs/hl<n>/led1**

---

Defined on file *debugfs-driver-habanalabs*

Sets the state of the second S/W led on the device

---

### **/sys/kernel/debug/habanalabs/hl<n>/led2**

---

Defined on file *debugfs-driver-habanalabs*

Sets the state of the third S/W led on the device

---

### **/sys/kernel/debug/habanalabs/hl<n>/mmu**

---

Defined on file *debugfs-driver-habanalabs*

Displays the hop values and physical address for a given ASID and virtual address. The user should write the ASID and VA into the file and then read the file to get the result. e.g. to display info about VA 0x1000 for ASID 1 you need to do: echo "1 0x1000" > /sys/kernel/debug/habanalabs/hl0/mmu

---

### **/sys/kernel/debug/habanalabs/hl<n>/set\_power\_state**

---

Defined on file *debugfs-driver-habanalabs*

Sets the PCI power state. Valid values are "1" for D0 and "2" for D3Hot

---

### **/sys/kernel/debug/habanalabs/hl<n>/stop\_on\_err**

---

Defined on file *debugfs-driver-habanalabs*

Sets the stop-on\_error option for the device engines. Value of “0” is for disable, otherwise enable.

**/sys/kernel/debug/habanalabs/hl<n>/userptr**

---

Defined on file *debugfs-driver-habanalabs*

Displays a list with information about the currently user pointers (user virtual addresses) that are pinned and mapped to DMA addresses

**/sys/kernel/debug/habanalabs/hl<n>/vm**

---

Defined on file *debugfs-driver-habanalabs*

Displays a list with information about all the active virtual address mappings per ASID

**/sys/kernel/debug/hisi\_hpre/<bdf>/cluster[0-3]/cluster\_ctrl**

---

Defined on file *debugfs-hisi-hpre*

Write the HPRE core selection in the cluster into this file, and then we can read the debug information of the core. Only available for PF.

**/sys/kernel/debug/hisi\_hpre/<bdf>/cluster[0-3]/regs**

---

Defined on file *debugfs-hisi-hpre*

Dump debug registers from the HPRE cluster. Only available for PF.

**/sys/kernel/debug/hisi\_hpre/<bdf>/current\_qm**

---

Defined on file *debugfs-hisi-hpre*

One HPRE controller has one PF and multiple VFs, each function has a QM. Select the QM which below qm refers to. Only available for PF.

**/sys/kernel/debug/hisi\_hpre/<bdf>/hpre\_dfx/invalid\_req\_cnt**

---

Defined on file *debugfs-hisi-hpre*

Dump the total number of invalid requests being received. Available for both PF and VF, and take no other effect on HPRE.

**/sys/kernel/debug/hisi\_hpre/<bdf>/hpre\_dfx/over\_thrld\_cnt**

---

Defined on file *debugfs-hisi-hpre*

Dump the total number of time out requests. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/hpre\_dfx/overtime\_thrhd**

---

Defined on file *debugfs-hisi-hpre*

Set the threshold time for counting the request which is processed longer than the threshold. 0: disable(default), 1: 1 microsecond. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/hpre\_dfx/recv\_cnt**

---

Defined on file *debugfs-hisi-hpre*

Dump the total number of received requests. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/hpre\_dfx/send\_busy\_cnt**

---

Defined on file *debugfs-hisi-hpre*

Dump the total number of requests sent with returning busy. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/hpre\_dfx/send\_cnt**

---

Defined on file *debugfs-hisi-hpre*

Dump the total number of sent requests. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/hpre\_dfx/send\_fail\_cnt**

---

Defined on file *debugfs-hisi-hpre*

Dump the total number of completed but error requests. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/qm/abnormal\_irq**

---

Defined on file *debugfs-hisi-hpre*

Dump the number of interrupts for QM abnormal event. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/qm/aeq\_irq**

---

Defined on file *debugfs-hisi-hpre*

Dump the number of QM async event queue interrupts. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/qm/clear\_enable**

---

Defined on file *debugfs-hisi-hpre*

QM debug registers(regs) read clear control. 1 means enable register read clear, otherwise 0. Writing to this file has no functional effect, only enable or disable counters clear after reading of these registers. Only available for PF.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/qm/create\_qp\_err**

---

Defined on file *debugfs-hisi-hpre*

Dump the number of queue allocation errors. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/qm/current\_q**

---

Defined on file *debugfs-hisi-hpre*

One QM may contain multiple queues. Select specific queue to show its debug registers in above regs. Only available for PF.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/qm/err\_irq**

---

Defined on file *debugfs-hisi-hpre*

Dump the number of invalid interrupts for QM task completion. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/qm(mb\_err**

---

Defined on file *debugfs-hisi-hpre*

Dump the number of failed QM mailbox commands. Available for both PF and VF, and take no other effect on HPRE.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/qm/regs**

---

Defined on file *debugfs-hisi-hpre*

Dump debug registers from the QM. Available for PF and VF in host. VF in guest currently only has one debug register.

---

**/sys/kernel/debug/hisi\_hpre/<bdf>/qm/status**

---

Defined on file *debugfs-hisi-hpre*

Dump the status of the QM. Four states: initiated, started, stopped and closed. Available for both PF and VF, and take no other effect on HPRE.

**/sys/kernel/debug/hisi\_hpre/<bdf>/rdclr\_en**

Defined on file *debugfs-hisi-hpre*

HPRE cores debug registers read clear control. 1 means enable register read clear, otherwise 0. Writing to this file has no functional effect, only enable or disable counters clear after reading of these registers. Only available for PF.

**/sys/kernel/debug/hisi\_hpre/<bdf>/regs**

Defined on file *debugfs-hisi-hpre*

Dump debug registers from the HPRE. Only available for PF.

**/sys/kernel/debug/hisi\_sec2/<bdf>/clear\_enable**

Defined on file *debugfs-hisi-sec*

Enabling/disabling of clear action after reading the SEC debug registers. 0: disable, 1: enable. Only available for PF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/current\_qm**

Defined on file *debugfs-hisi-sec*

One SEC controller has one PF and multiple VFs, each function has a QM. This file can be used to select the QM which below qm refers to. Only available for PF.

**/sys/kernel/debug/hisi\_sec2/<bdf>/qm/abnormal\_irq**

Defined on file *debugfs-hisi-sec*

Dump the number of interrupts for QM abnormal event. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/qm/aeq\_irq**

Defined on file *debugfs-hisi-sec*

Dump the number of QM async event queue interrupts. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/qm/clear\_enable**

Defined on file *debugfs-hisi-sec*

Enabling/disabling of clear action after reading the SEC's QM debug registers.  
0: disable, 1: enable. Only available for PF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/qm/create\_qp\_err**

Defined on file *debugfs-hisi-sec*

Dump the number of queue allocation errors. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/qm/current\_q**

Defined on file *debugfs-hisi-sec*

One QM of SEC may contain multiple queues. Select specific queue to show its debug registers in above 'regs'. Only available for PF.

**/sys/kernel/debug/hisi\_sec2/<bdf>/qm/err\_irq**

Defined on file *debugfs-hisi-sec*

Dump the number of invalid interrupts for QM task completion. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/qm(mb\_err**

Defined on file *debugfs-hisi-sec*

Dump the number of failed QM mailbox commands. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/qm/qm\_regs**

Defined on file *debugfs-hisi-sec*

Dump of QM related debug registers. Available for PF and VF in host. VF in guest currently only has one debug register.

**/sys/kernel/debug/hisi\_sec2/<bdf>/qm/status**

Defined on file *debugfs-hisi-sec*

Dump the status of the QM. Four states: initiated, started, stopped and closed. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/sec\_dfx/done\_flag\_cnt**

Defined on file *debugfs-hisi-sec*

Dump the total number of completed but marked error requests to be received. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/sec\_dfx/err\_bd\_cnt**

Defined on file *debugfs-hisi-sec*

Dump the total number of BD type error requests to be received. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/sec\_dfx/invalid\_req\_cnt**

Defined on file *debugfs-hisi-sec*

Dump the total number of invalid requests being received. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/sec\_dfx/recv\_cnt**

Defined on file *debugfs-hisi-sec*

Dump the total number of received requests. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/sec\_dfx/send\_busy\_cnt**

Defined on file *debugfs-hisi-sec*

Dump the total number of requests sent with returning busy. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_sec2/<bdf>/sec\_dfx/send\_cnt**

Defined on file *debugfs-hisi-sec*

Dump the total number of sent requests. Available for both PF and VF, and take no other effect on SEC.

**/sys/kernel/debug/hisi\_zip/<bdf>/clear\_enable**

Defined on file *debugfs-hisi-zip*

Compression/decompression core debug registers read clear control. 1 means enable register read clear, otherwise 0. Writing to this file has no functional effect, only enable or disable counters clear after reading of these registers. Only available for PF.

### **/sys/kernel/debug/hisi\_zip/<bdf>/comp\_core[01]/regs**

Defined on file *debugfs-hisi-zip*

Dump of compression cores related debug registers. Only available for PF.

### **/sys/kernel/debug/hisi\_zip/<bdf>/current\_qm**

Defined on file *debugfs-hisi-zip*

One ZIP controller has one PF and multiple VFs, each function has a QM. Select the QM which below qm refers to. Only available for PF.

### **/sys/kernel/debug/hisi\_zip/<bdf>/decomp\_core[0-5]/regs**

Defined on file *debugfs-hisi-zip*

Dump of decompression cores related debug registers. Only available for PF.

### **/sys/kernel/debug/hisi\_zip/<bdf>/qm/abnormal\_irq**

Defined on file *debugfs-hisi-zip*

Dump the number of interrupts for QM abnormal event. Available for both PF and VF, and take no other effect on ZIP.

### **/sys/kernel/debug/hisi\_zip/<bdf>/qm/aeq\_irq**

Defined on file *debugfs-hisi-zip*

Dump the number of QM async event queue interrupts. Available for both PF and VF, and take no other effect on ZIP.

### **/sys/kernel/debug/hisi\_zip/<bdf>/qm/clear\_enable**

Defined on file *debugfs-hisi-zip*

QM debug registers(regs) read clear control. 1 means enable register read clear, otherwise 0. Writing to this file has no functional effect, only enable or disable counters clear after reading of these registers. Only available for PF.

### **/sys/kernel/debug/hisi\_zip/<bdf>/qm/create\_qp\_err**

Defined on file *debugfs-hisi-zip*

Dump the number of queue allocation errors. Available for both PF and VF, and take no other effect on ZIP.

---

**/sys/kernel/debug/hisi\_zip/<bdf>/qm/current\_q**

Defined on file *debugfs-hisi-zip*

One QM may contain multiple queues. Select specific queue to show its debug registers in above regs. Only available for PF.

---

**/sys/kernel/debug/hisi\_zip/<bdf>/qm/err\_irq**

Defined on file *debugfs-hisi-zip*

Dump the number of invalid interrupts for QM task completion. Available for both PF and VF, and take no other effect on ZIP.

---

**/sys/kernel/debug/hisi\_zip/<bdf>/qm(mb\_err**

Defined on file *debugfs-hisi-zip*

Dump the number of failed QM mailbox commands. Available for both PF and VF, and take no other effect on ZIP.

---

**/sys/kernel/debug/hisi\_zip/<bdf>/qm/regs**

Defined on file *debugfs-hisi-zip*

Dump of QM related debug registers. Available for PF and VF in host. VF in guest currently only has one debug register.

---

**/sys/kernel/debug/hisi\_zip/<bdf>/qm/status**

Defined on file *debugfs-hisi-zip*

Dump the status of the QM. Four states: initiated, started, stopped and closed. Available for both PF and VF, and take no other effect on ZIP.

---

**/sys/kernel/debug/hisi\_zip/<bdf>/zip\_dfx/err\_bd\_cnt**

Defined on file *debugfs-hisi-zip*

Dump the total number of BD type error requests to be received. Available for both PF and VF, and take no other effect on ZIP.

---

**/sys/kernel/debug/hisi\_zip/<bdf>/zip\_dfx/recv\_cnt**

Defined on file *debugfs-hisi-zip*

Dump the total number of received requests. Available for both PF and VF, and take no other effect on ZIP.

### `/sys/kernel/debug/hisi_zip/<bdf>/zip_dfx/send_busy_cnt`

Defined on file *debugfs-hisi-zip*

Dump the total number of requests received with returning busy. Available for both PF and VF, and take no other effect on ZIP.

### `/sys/kernel/debug/hisi_zip/<bdf>/zip_dfx/send_cnt`

Defined on file *debugfs-hisi-zip*

Dump the total number of sent requests. Available for both PF and VF, and take no other effect on ZIP.

### `/sys/kernel/debug/hyperv/<UUID>/delay/fuzz_test_buffer_interrupt_delay`

Defined on file *debugfs-hyperv*

**Fuzz testing buffer interrupt delay value between 0 - 1000 microseconds (inclusive).**

Users: Debugging tools

### `/sys/kernel/debug/hyperv/<UUID>/delay/fuzz_test_message_delay`

Defined on file *debugfs-hyperv*

**Fuzz testing message delay value between 0 - 1000 microseconds (inclusive).**

Users: Debugging tools

### `/sys/kernel/debug/hyperv/<UUID>/fuzz_test_state`

Defined on file *debugfs-hyperv*

Fuzz testing status of a vmbus device, whether its in an ON state or a OFF state

Users: Debugging tools

### `/sys/kernel/debug/ideapad/cfg`

Defined on file *debugfs-ideapad*

cfg shows the return value of \_CFG method in VPC2004 device. It tells machine capability and what graphic component within the machine.

### `/sys/kernel/debug/ideapad/status`

Defined on file *debugfs-ideapad*

status shows infos we can read and tells its meaning and value.

### /sys/kernel/debug/moxtet/input

Defined on file *debugfs-moxtet*

(Read) Read input from the shift registers, in hexadecimal. Returns N+1 bytes, where N is the number of Moxtet connected modules. The first byte is from the CPU board itself.

Example:

101214

10	CPU board with SD card
12	2 = PCIe module, 1 = IRQ not active
14	4 = Peridot module, 1 = IRQ not active

### /sys/kernel/debug/moxtet/output

Defined on file *debugfs-moxtet*

(RW) Read last written value to the shift registers, in hexadecimal, or write values to the shift registers, also in hexadecimal.

Example:

0102

01	01 was last written, or is to be written, to the first module' s shift register
02	the same for second module

### /sys/kernel/debug/nx-crypto/\*

Defined on file *debugfs-pfo-nx-crypto*

These debugfs interfaces are built by the nx-crypto driver, built in arch/powerpc/crypto/nx.

Error Detection

**errors:**

A u32 providing a total count of errors since the driver was loaded. The only errors counted here are those returned from the hcall, H\_COP\_OP.

**last\_error:**

The most recent non-zero return code from the H\_COP\_OP hcall. -EBUSY is not recorded here (the hcall will retry until -EBUSY goes away).

**last\_error\_pid:**

The process ID of the process who received the most recent error from the hcall.

Device Use

**aes\_bytes:**

The total number of bytes encrypted using AES in any of the driver's supported modes.

**aes\_ops:**

The total number of AES operations submitted to the hardware.

**sha256\_bytes:**

The total number of bytes hashed by the hardware using SHA-256.

**sha256\_ops:**

The total number of SHA-256 operations submitted to the hardware.

**sha512\_bytes:**

The total number of bytes hashed by the hardware using SHA-512.

**sha512\_ops:**

The total number of SHA-512 operations submitted to the hardware.

---

**/sys/kernel/debug/olpc-ec/cmd**

---

Defined on file *debugfs-olpc*

A generic interface for executing OLPC Embedded Controller commands and reading their responses.

To execute a command, write data with the format: CC:N A A A A CC is the (hex) command, N is the count of expected reply bytes, and A A A A are optional (hex) arguments.

To read the response (if any), read from the generic node after executing a command. Hex reply bytes will be returned, *whether or not* they came from the immediately previous command.

---

**/sys/kernel/debug/pktcdvd/pktcdvd[0-7]**

---

Defined on file *debugfs-pktcdvd*

The pktcdvd module (packet writing driver) creates these files in debugfs:

/sys/kernel/debug/pktcdvd/pktcdvd[0-7]/

---

info 0444 Lots of driver statistics and infos.

---

Example:

```
cat /sys/kernel/debug/pktcdvd/pktcdvd0/info
```

---

**/sys/kernel/debug/powerpc/memtrace**

Defined on file *ppc-memtrace*

This folder contains the relevant debugfs files for the hardware trace macro to use. CONFIG\_PPC64\_HARDWARE\_TRACING must be set.

---

**/sys/kernel/debug/powerpc/memtrace/<node-id>**

Defined on file *ppc-memtrace*

This directory contains information about the removed memory from the specific NUMA node.

---

**/sys/kernel/debug/powerpc/memtrace/<node-id>/size**

Defined on file *ppc-memtrace*

This contains the size of the memory removed from the node.

---

**/sys/kernel/debug/powerpc/memtrace/<node-id>/start**

Defined on file *ppc-memtrace*

This contains the start address of the removed memory.

---

**/sys/kernel/debug/powerpc/memtrace/<node-id>/trace**

Defined on file *ppc-memtrace*

This is where the hardware trace macro will output the trace it generates.

---

**/sys/kernel/debug/powerpc/memtrace/enable**

Defined on file *ppc-memtrace*

Write an integer containing the size in bytes of the memory you want removed from each NUMA node to this file - it must be aligned to the memblock size. This amount of RAM will be removed from each NUMA node in the kernel mappings and the following debugfs files will be created. Once memory is successfully removed from each node, the following files are created. To re-add memory to the kernel, echo 0 into this file (it will be automatically onlined).

---

**/sys/kernel/debug/turris-mox-rwtm/do\_sign**

Defined on file *debugfs-turris-mox-rwtm*

(Wri Message to sign with the ECDSA private key stored in device' s OTP.  
The message must be exactly 64 bytes (since this is intended for SHA-512 hashes).

(Rea The resulting signature, 136 bytes. This contains the R and S values of the ECDSA signature, both in big-endian format.

---

### /sys/kernel/debug/wilco\_ec/h1\_gpio

Defined on file [debugfs-wilco-ec](#)

As part of Chrome OS' s FAFT (Fully Automated Firmware Testing) tests, we need to ensure that the H1 chip is properly setting some GPIO lines. The h1\_gpio attribute exposes the state of the lines: - ENTRY\_TO\_FACT\_MODE in BIT(0) - SPI\_CHROME\_SEL in BIT(1)

Output will be formatted with “0x%02xn” .

### /sys/kernel/debug/wilco\_ec/raw

Defined on file [debugfs-wilco-ec](#)

Write and read raw mailbox commands to the EC.

You can write a hexadecimal sentence to raw, and that series of bytes will be sent to the EC. Then, you can read the bytes of response by reading from raw.

For writing, bytes 0-1 indicate the message type, one of enum wilco\_ec\_msg\_type. Byte 2+ consist of the data passed in the request, starting at MBOX[0]. At least three bytes are required for writing, two for the type and at least a single byte of data.

Example:

```
// Request EC info type 3 (EC firmware build date)
// Corresponds with sending type 0x00f0 with
// MBOX = [38, 00, 03, 00]
$ echo 00 f0 38 00 03 00 > :ref:`\`/sys\kernel\debug\wilco_ec\`raw<abi_sys_kernel_debug_wilco_ec_raw>`
// View the result. The decoded ASCII result "12/21/18" is
// included after the raw hex.
// Corresponds with MBOX = [00, 00, 31, 32, 2f, 32, 31, 38, ...]
$ cat :ref:`\`/sys\kernel\debug\wilco_ec\`raw<abi_sys_kernel_debug_wilco_ec_raw>`
00 00 31 32 2f 32 31 2f 31 38 00 38 00 01 00 2f 00 ..12/21/18.8...
```

Note that the first 16 bytes of the received MBOX[] will be printed, even if some of the data is junk, and skipping bytes 17 to 32. It is up to you to know how many of the first bytes of data are the actual response.

### /sys/kernel/fadump/\*

Defined on file *sysfs-kernel-fadump*

The /sys/kernel/fadump/\* is a collection of FADump sysfs file provide information about the configuration status of Firmware Assisted Dump (FADump).

### **/sys/kernel/fadump/enabled**

Defined on file *sysfs-kernel-fadump*

read only Primarily used to identify whether the FADump is enabled in the kernel or not. User: Kdump service

### **/sys/kernel/fadump/mem\_reserved**

Defined on file *sysfs-kernel-fadump*

read only Provide information about the amount of memory reserved by FADump to save the crash dump in bytes.

### **/sys/kernel/fadump/registered**

Defined on file *sysfs-kernel-fadump*

read/write Helps to control the dump collect feature from userspace. Setting 1 to this file enables the system to collect the dump and 0 to disable it. User: Kdump service

### **/sys/kernel/fadump/release\_mem**

Defined on file *sysfs-kernel-fadump*

write only This is a special sysfs file and only available when the system is booted to capture the vmcore using FADump. It is used to release the memory reserved by FADump to save the crash dump.

### **/sys/kernel/fscaps**

Defined on file *sysfs-kernel-fscaps*

Shows whether file system capabilities are honored when executing a binary

### **/sys/kernel/iommu\_groups/**

Defined on file *sysfs-kernel-iommu\_groups*

*/sys/kernel/iommu\_groups/* contains a number of sub-directories, each representing an IOMMU group. The name of the sub-directory matches the

`iommu_group_id()` for the group, which is an integer value. Within each subdirectory is another directory named “devices” with links to the sysfs devices contained in this group. The group directory also optionally contains a “name” file if the IOMMU driver has chosen to register a more common name for the group.

### **/sys/kernel/iommu\_groups/reserved\_regions**

Defined on file *sysfs-kernel-iommu\_groups*

*/sys/kernel/iommu\_groups/reserved\_regions* list IOVA regions that are reserved. Not necessarily all reserved regions are listed. This is typically used to output direct-mapped, MSI, non mappable regions. Each region is described on a single line: the 1st field is the base IOVA, the second is the end IOVA and the third field describes the type of the region.

In case an RMRR is used only by graphics or USB devices it is now exposed as “direct-relaxable” instead of “direct”. In device assignment use case, for instance, those RMRR are considered to be relaxable and safe.

### **/sys/kernel/irq**

Defined on file *sysfs-kernel-irq*

Directory containing information about the system’s IRQs. Specifically, data from the associated struct `irq_desc`. The information here is similar to that in */proc/interrupts* but in a more machine-friendly format. This directory contains one subdirectory for each Linux IRQ number.

### **/sys/kernel/irq/<irq>/actions**

Defined on file *sysfs-kernel-irq*

The IRQ action chain. A comma-separated list of zero or more device names associated with this interrupt.

### **/sys/kernel/irq/<irq>/chip\_name**

Defined on file *sysfs-kernel-irq*

Human-readable chip name supplied by the associated device driver.

### **/sys/kernel/irq/<irq>/hwirq**

Defined on file *sysfs-kernel-irq*

When interrupt translation domains are used, this file contains the underlying hardware IRQ number used for this Linux IRQ.

### **/sys/kernel/irq/<irq>/name**

Defined on file [sysfs-kernel-irq](#)

Human-readable flow handler name as defined by the irq chip driver.

---

**/sys/kernel/irq/<irq>/per\_cpu\_count**

---

Defined on file [sysfs-kernel-irq](#)

The number of times the interrupt has fired since boot. This is a comma-separated list of counters; one per CPU in CPU id order. NOTE: This file consistently shows counters for all CPU ids. This differs from the behavior of /proc/interrupts which only shows counters for online CPUs.

---

**/sys/kernel/irq/<irq>/type**

---

Defined on file [sysfs-kernel-irq](#)

The type of the interrupt. Either the string ‘level’ or ‘edge’ .

---

**/sys/kernel/irq/<irq>/wakeup**

---

Defined on file [sysfs-kernel-irq](#)

The wakeup state of the interrupt. Either the string ‘enabled’ or ‘disabled’ .

---

**/sys/kernel/livepatch**

---

Defined on file [sysfs-kernel-livepatch](#)

Interface for kernel live patching

The [/sys/kernel/livepatch](#) directory contains subdirectories for each loaded live patch module.

---

**/sys/kernel/livepatch/<patch>**

---

Defined on file [sysfs-kernel-livepatch](#)

The patch directory contains subdirectories for each kernel object (vmlinux or a module) in which it patched functions.

---

**/sys/kernel/livepatch/<patch>/<object>**

---

Defined on file [sysfs-kernel-livepatch](#)

The object directory contains subdirectories for each function that is patched within the object.

---

**/sys/kernel/livepatch/<patch>/<object>/<function,sympos>**

---

Defined on file *sysfs-kernel-livepatch*

The function directory contains attributes regarding the properties and state of the patched function.

The directory name contains the patched function name and a symbol number corresponding to the nth occurrence of the symbol name in kallsyms for the patched object.

There are currently no such attributes.

### **/sys/kernel/livepatch/<patch>/enabled**

Defined on file *sysfs-kernel-livepatch*

A writable attribute that indicates whether the patched code is currently applied. Writing 0 will disable the patch while writing 1 will re-enable the patch.

### **/sys/kernel/livepatch/<patch>/force**

Defined on file *sysfs-kernel-livepatch*

A writable attribute that allows administrator to affect the course of an existing transition. Writing 1 clears TIF\_PATCH\_PENDING flag of all tasks and thus forces the tasks to the patched or unpatched state. Administrator should not use this feature without a clearance from a patch distributor. Removal (rmmod) of patch modules is permanently disabled when the feature is used. See /livepatch/livepatch for more information.

### **/sys/kernel/livepatch/<patch>/transition**

Defined on file *sysfs-kernel-livepatch*

An attribute which indicates whether the patch is currently in transition.

### **/sys/kernel/mm**

Defined on file *sysfs-kernel-mm*

/sys/kernel/mm/ should contain any and all VM related information in /sys/kernel/.

### **/sys/kernel/mm/hugepages/**

Defined on file *sysfs-kernel-mm-hugepages*

*/sys/kernel/mm/hugepages/* contains a number of subdirectories of the form hugepages-<size>kB, where <size> is the page size of the hugepages supported by the kernel/CPU combination.

Under these directories are a number of files:

- nr\_hugepages

- nr\_overcommit\_hugepages
- free\_hugepages
- surplus\_hugepages
- resv\_hugepages

See [HugeTLB Pages](#) for details.

### **/sys/kernel/mm/ksm**

Defined on file [sysfs-kernel-mm-ksm](#)

Interface for Kernel Samepage Merging (KSM)

<b>/sys/kernel/mm/ksm/full_scans</b>
<b>/sys/kernel/mm/ksm/pages_shared</b>
<b>/sys/kernel/mm/ksm/pages_sharing</b>
<b>/sys/kernel/mm/ksm/pages_to_scan</b>
<b>/sys/kernel/mm/ksm/pages_unshared</b>
<b>/sys/kernel/mm/ksm/pages_volatile</b>
<b>/sys/kernel/mm/ksm/run</b>
<b>/sys/kernel/mm/ksm/sleep_millisecs</b>

Defined on file [sysfs-kernel-mm-ksm](#)

Kernel Samepage Merging daemon sysfs interface

full\_scans: how many times all mergeable areas have been scanned.

pages\_shared: how many shared pages are being used.

pages\_sharing: how many more sites are sharing them i.e. how much saved.

pages\_to\_scan: how many present pages to scan before ksmd goes to sleep.

pages\_unshared: how many pages unique but repeatedly checked for merging.

pages\_volatile: how many pages changing too fast to be placed in a tree.

run: write 0 to disable ksm, read 0 while ksm is disabled.

- write 1 to run ksm, read 1 while ksm is running.
- write 2 to disable ksm and unmerge all its pages.

sleep\_millisecs: how many milliseconds ksm should sleep between scans.

See /vm/ksm for more information.

### **/sys/kernel/mm/ksm/merge\_across\_nodes**

Defined on file [sysfs-kernel-mm-ksm](#)

Control merging pages across different NUMA nodes.

When it is set to 0 only pages from the same node are merged, otherwise pages from all nodes can be merged together (default).

### /sys/kernel/mm/swap/

Defined on file *sysfs-kernel-mm-swap*

Interface for swapping

### /sys/kernel/mm/swap/vma\_ra\_enabled

Defined on file *sysfs-kernel-mm-swap*

Enable/disable VMA based swap readahead.

If set to true, the VMA based swap readahead algorithm will be used for swappable anonymous pages mapped in a VMA, and the global swap readahead algorithm will be still used for tmpfs etc. other users. If set to false, the global swap readahead algorithm will be used for all swappable pages.

### /sys/kernel/oops\_count

Defined on file *sysfs-kernel-oops\_count*

Shows how many times the system has Ooopsed since last boot.

### /sys/kernel/profiling

Defined on file *sysfs-profiling*

*/sys/kernel/profiling* is the runtime equivalent of the boot-time profile= option.

You can get the same effect running:

```
echo 2 > :ref:`\sys\kernel\profiling <abi_sys_kernel_profiling>`
```

as you would by issuing profile=2 on the boot command line.

### /sys/kernel/slab

Defined on file *sysfs-kernel-slab*

The */sys/kernel/slab* directory contains a snapshot of the internal state of the SLUB allocator for each cache. Certain files may be modified to change the behavior of the cache (and any cache it aliases, if any).

Users: kernel memory tuning tools

### /sys/kernel/slab/cache/aliases

Defined on file *sysfs-kernel-slab*

The aliases file is read-only and specifies how many caches have merged into this cache.

### **/sys/kernel/slab/cache/align**

Defined on file *sysfs-kernel-slab*

The align file is read-only and specifies the cache's object alignment in bytes.

### **/sys/kernel/slab/cache/alloc\_calls**

Defined on file *sysfs-kernel-slab*

The alloc\_calls file is read-only and lists the kernel code locations from which allocations for this cache were performed. The alloc\_calls file only contains information if debugging is enabled for that cache (see /vm/slub).

### **/sys/kernel/slab/cache/alloc\_fastpath**

Defined on file *sysfs-kernel-slab*

The alloc\_fastpath file shows how many objects have been allocated using the fast path. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/alloc\_from\_partial**

Defined on file *sysfs-kernel-slab*

The alloc\_from\_partial file shows how many times a cpu slab has been full and it has been refilled by using a slab from the list of partially used slabs. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/alloc\_refill**

Defined on file *sysfs-kernel-slab*

The alloc\_refill file shows how many times the per-cpu freelist was empty but there were objects available as the result of remote cpu frees. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/alloc\_slab**

Defined on file *sysfs-kernel-slab*

The alloc\_slab file is shows how many times a new slab had to be allocated from the page allocator. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/alloc\_slowpath**

Defined on file *sysfs-kernel-slab*

The alloc\_slowpath file shows how many objects have been allocated using the slow path because of a refill or allocation from a partial or new slab. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/cache\_dma**

Defined on file *sysfs-kernel-slab*

The cache\_dma file is read-only and specifies whether objects are from ZONE\_DMA. Available when CONFIG\_ZONE\_DMA is enabled.

### **/sys/kernel/slab/cache/cpu\_slabs**

Defined on file *sysfs-kernel-slab*

The cpu\_slabs file is read-only and displays how many cpu slabs are active and their NUMA locality.

### **/sys/kernel/slab/cache/cpuslab\_flush**

Defined on file *sysfs-kernel-slab*

The file cpuslab\_flush shows how many times a cache's cpu slabs have been flushed as the result of destroying or shrinking a cache, a cpu going offline, or as the result of forcing an allocation from a certain node. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/ctor**

Defined on file *sysfs-kernel-slab*

The ctor file is read-only and specifies the cache's object constructor function, which is invoked for each object when a new slab is allocated.

### **/sys/kernel/slab/cache/deactivate\_empty**

Defined on file *sysfs-kernel-slab*

The deactivate\_empty file shows how many times an empty cpu slab was deactivated. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

---

**/sys/kernel/slab/cache/deactivate\_full**

Defined on file *sysfs-kernel-slab*

The deactivate\_full file shows how many times a full cpu slab was deactivated. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

---

**/sys/kernel/slab/cache/deactivate\_remote\_frees**

Defined on file *sysfs-kernel-slab*

The deactivate\_remote\_frees file shows how many times a cpu slab has been deactivated and contained free objects that were freed remotely. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

---

**/sys/kernel/slab/cache/deactivate\_to\_head**

Defined on file *sysfs-kernel-slab*

The deactivate\_to\_head file shows how many times a partial cpu slab was deactivated and added to the head of its node's partial list. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

---

**/sys/kernel/slab/cache/deactivate\_to\_tail**

Defined on file *sysfs-kernel-slab*

The deactivate\_to\_tail file shows how many times a partial cpu slab was deactivated and added to the tail of its node's partial list. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

---

**/sys/kernel/slab/cache/destroy\_by\_rcu**

Defined on file *sysfs-kernel-slab*

The destroy\_by\_rcu file is read-only and specifies whether slabs (not objects) are freed by rcu.

---

**/sys/kernel/slab/cache/free\_add\_partial**

Defined on file *sysfs-kernel-slab*

The free\_add\_partial file shows how many times an object has been freed in a full slab so that it had to be added to its node's partial list. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

---

**/sys/kernel/slab/cache/free\_calls**

Defined on file *sysfs-kernel-slab*

The free\_calls file is read-only and lists the locations of object frees if slab debugging is enabled (see /vm/slub).

### **/sys/kernel/slab/cache/free\_fastpath**

Defined on file *sysfs-kernel-slab*

The free\_fastpath file shows how many objects have been freed using the fast path because it was an object from the cpu slab. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/free\_frozen**

Defined on file *sysfs-kernel-slab*

The free\_frozen file shows how many objects have been freed to a frozen slab (i.e. a remote cpu slab). It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/free\_remove\_partial**

Defined on file *sysfs-kernel-slab*

The free\_remove\_partial file shows how many times an object has been freed to a now-empty slab so that it had to be removed from its node's partial list. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/free\_slab**

Defined on file *sysfs-kernel-slab*

The free\_slab file shows how many times an empty slab has been freed back to the page allocator. It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/free\_slowpath**

Defined on file *sysfs-kernel-slab*

The free\_slowpath file shows how many objects have been freed using the slow path (i.e. to a full or partial slab). It can be written to clear the current count. Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/hwcache\_align**

Defined on file *sysfs-kernel-slab*

The hwcache\_align file is read-only and specifies whether objects are aligned on cachelines.

---

**/sys/kernel/slab/cache/min\_partial**

---

Defined on file *sysfs-kernel-slab*

The min\_partial file specifies how many empty slabs shall remain on a node's partial list to avoid the overhead of allocating new slabs. Such slabs may be reclaimed by utilizing the shrink file.

---

**/sys/kernel/slab/cache/object\_size**

---

Defined on file *sysfs-kernel-slab*

The object\_size file is read-only and specifies the cache's object size.

---

**/sys/kernel/slab/cache/objects**

---

Defined on file *sysfs-kernel-slab*

The objects file is read-only and displays how many objects are active and from which nodes they are from.

---

**/sys/kernel/slab/cache/objects\_partial**

---

Defined on file *sysfs-kernel-slab*

The objects\_partial file is read-only and displays how many objects are on partial slabs and from which nodes they are from.

---

**/sys/kernel/slab/cache/objs\_per\_slab**

---

Defined on file *sysfs-kernel-slab*

The file objs\_per\_slab is read-only and specifies how many objects may be allocated from a single slab of the order specified in [\*/sys/kernel/slab/cache/order\*](#).

---

**/sys/kernel/slab/cache/order**

---

Defined on file *sysfs-kernel-slab*

The order file specifies the page order at which new slabs are allocated. It is writable and can be changed to increase the number of objects per slab. If a slab cannot be allocated because of fragmentation, SLUB will retry with the minimum order possible depending on its characteristics.

When debug\_guardpage\_minorder=N (N > 0) parameter is specified (see [\*The kernel's command-line parameters\*](#)), the minimum possible order is used and this sysfs entry can not be used to change the order at run time.

### **/sys/kernel/slab/cache/orderFallback**

Defined on file *sysfs-kernel-slab*

The orderFallback file shows how many times an allocation of a new slab has not been possible at the cache's order and instead fallen back to its minimum possible order. It can be written to clear the current count.

Available when CONFIG\_SLUB\_STATS is enabled.

### **/sys/kernel/slab/cache/partial**

Defined on file *sysfs-kernel-slab*

The partial file is read-only and displays how long many partial slabs there are and how long each node's list is.

### **/sys/kernel/slab/cache/poison**

Defined on file *sysfs-kernel-slab*

The poison file specifies whether objects should be poisoned when a new slab is allocated.

### **/sys/kernel/slab/cache/reclaim\_account**

Defined on file *sysfs-kernel-slab*

The reclaim\_account file specifies whether the cache's objects are reclaimable (and grouped by their mobility).

### **/sys/kernel/slab/cache/red\_zone**

Defined on file *sysfs-kernel-slab*

The red\_zone file specifies whether the cache's objects are red zoned.

### **/sys/kernel/slab/cache/remote\_node\_defrag\_ratio**

Defined on file *sysfs-kernel-slab*

The file remote\_node\_defrag\_ratio specifies the percentage of times SLUB will attempt to refill the cpu slab with a partial slab from a remote node as opposed to allocating a new slab on the local node. This reduces the amount of wasted memory over the entire system but can be expensive.

Available when CONFIG\_NUMA is enabled.

### **/sys/kernel/slab/cache/sanity\_checks**

Defined on file *sysfs-kernel-slab*

The sanity\_checks file specifies whether expensive checks should be performed on free and, at minimum, enables double free checks. Caches that enable sanity\_checks cannot be merged with caches that do not.

### **/sys/kernel/slab/cache/shrink**

Defined on file *sysfs-kernel-slab*

The shrink file is used to reclaim unused slab cache memory from a cache. Empty per-cpu or partial slabs are freed and the partial list is sorted so the slabs with the fewest available objects are used first. It only accepts a value of “1” on write for shrinking the cache. Other input values are considered invalid. Shrinking slab caches might be expensive and can adversely impact other running applications. So it should be used with care.

### **/sys/kernel/slab/cache/slab\_size**

Defined on file *sysfs-kernel-slab*

The slab\_size file is read-only and specifies the object size with metadata (debugging information and alignment) in bytes.

### **/sys/kernel/slab/cache/slabs**

Defined on file *sysfs-kernel-slab*

The slabs file is read-only and displays how long many slabs there are (both cpu and partial) and from which nodes they are from.

### **/sys/kernel/slab/cache/store\_user**

Defined on file *sysfs-kernel-slab*

The store\_user file specifies whether the location of allocation or free should be tracked for a cache.

### **/sys/kernel/slab/cache/total\_objects**

Defined on file *sysfs-kernel-slab*

The total\_objects file is read-only and displays how many total objects a cache has and from which nodes they are from.

### **/sys/kernel/slab/cache/trace**

Defined on file *sysfs-kernel-slab*

The trace file specifies whether object allocations and frees should be traced.

### /sys/kernel/slab/cache/validate

Defined on file *sysfs-kernel-slab*

Writing to the validate file causes SLUB to traverse all of its cache's objects and check the validity of metadata.

### /sys/kernel/vmcoreinfo

Defined on file *sysfs-kernel-vmcoreinfo*

Shows physical address and size of vmcoreinfo ELF note. First value contains physical address of note in hex and second value contains the size of note in hex. This ELF note info is parsed by second kernel and exported to user space as part of ELF note in /proc/vmcore file. This note contains various information like struct size, symbol values, page size etc.

### /sys/kernel/warn\_count

Defined on file *sysfs-kernel-warn\_count*

Shows how many times the system has Warned since last boot.

## 5.2.27 Symbols under /sys/module

### /sys/module/\*/taint

Defined on file *sysfs-module*

**Module taint flags:**

P	proprietary module
O	out-of-tree module
F	force-loaded module
C	staging driver module
E	unsigned module

### /sys/module/\*/{coresize,initsize}

Defined on file *sysfs-module*

Module size in bytes.

### /sys/module/ehci\_hcd/drivers/…/uframe\_periodic\_max

Defined on file *sysfs-module*

Maximum time allowed for periodic transfers per microframe ( $\mu\text{s}$ )

**Note:**

USB 2.0 sets maximum allowed time for periodic transfers per microframe to be 80%, that is 100 microseconds out of 125 microseconds (full microframe).

However there are cases, when 80% max isochronous bandwidth is too limiting. For example two video streams could require 110 microseconds of isochronous bandwidth per microframe to work together.

Through this setting it is possible to raise the limit so that the host controller would allow allocating more than 100 microseconds of periodic bandwidth per microframe.

Beware, non-standard modes are usually not thoroughly tested by hardware designers, and the hardware can malfunction when this setting differ from default 100.

### **/sys/module/pch\_phub/drivers/…/pch\_firmware**

Defined on file *sysfs-module*

Write/read Option ROM data.

### **/sys/module/pch\_phub/drivers/…/pch\_mac**

Defined on file *sysfs-module*

Write/read GbE MAC address.

### **/sys/module/xen\_blkback/parameters/buffer\_squeeze\_duration\_ms**

Defined on file *sysfs-driver-xen-blkback*

When memory pressure is reported to blkback this option controls the duration in milliseconds that blkback will not cache any page not backed by a grant mapping. The default is 10ms.

### **/sys/module/xen\_blkback/parameters/feature\_persistent**

Defined on file *sysfs-driver-xen-blkback*

Whether to enable the persistent grants feature or not. Note that this option only takes effect on newly connected backends. The default is Y (enable).

### **/sys/module/xen\_blkback/parameters/max\_buffer\_pages**

Defined on file *sysfs-driver-xen-blkback*

Maximum number of free pages to keep in each block backend buffer.

### /sys/module/xen\_blkback/parameters/max\_persistent\_grants

Defined on file *sysfs-driver-xen-blkback*

Maximum number of grants to map persistently in blkback. If the frontend tries to use more than max\_persistent\_grants, the LRU kicks in and starts removing 5% of max\_persistent\_grants every 100ms.

### /sys/module/xen\_blkback/parameters/persistent\_grant\_unused\_seconds

Defined on file *sysfs-driver-xen-blkback*

How long a persistent grant is allowed to remain allocated without being in use. The time is in seconds, 0 means indefinitely long. The default is 60 seconds.

### /sys/module/xen\_blkfront/parameters/feature\_persistent

Defined on file *sysfs-driver-xen-blkfront*

Whether to enable the persistent grants feature or not. Note that this option only takes effect on newly connected frontends. The default is Y (enable).

### /sys/module/xen\_blkfront/parameters/max\_indirect\_segments

Defined on file *sysfs-driver-xen-blkfront*

Maximum number of segments that the frontend will negotiate with the backend for indirect descriptors. The default value is 32 - higher value means more potential throughput but more memory usage. The backend picks the minimum of the frontend and its default backend value.

## 5.2.28 Symbols under /sys/power

### /sys/power/

Defined on file *sysfs-power*

The /sys/power directory will contain files that will provide a unified interface to the power management subsystem.

### /sys/power/autosleep

Defined on file *sysfs-power*

The */sys/power/autosleep* file can be written one of the strings returned by reads from /sys/power/state. If that happens, a work item attempting to trigger a transition of the system to the sleep state represented by that string is queued up. This

attempt will only succeed if there are no active wakeup sources in the system at that time. After every execution, regardless of whether or not the attempt to put the system to sleep has succeeded, the work item requeues itself until user space writes “off” to [\*/sys/power/autosleep\*](#).

Reading from this file causes the last string successfully written to it to be returned.

### **/sys/power/disk**

Defined on file [\*sysfs-power\*](#)

The [\*/sys/power/disk\*](#) file controls the operating mode of the suspend-to-disk mechanism. Reading from this file returns the name of the method by which the system will be put to sleep on the next suspend. There are four methods supported:

‘firmware’ - means that the memory image will be saved to disk by some firmware, in which case we also assume that the firmware will handle the system suspend.

‘platform’ - the memory image will be saved by the kernel and the system will be put to sleep by the platform driver (e.g. ACPI or other PM registers).

‘shutdown’ - the memory image will be saved by the kernel and the system will be powered off.

‘reboot’ - the memory image will be saved by the kernel and the system will be rebooted.

Additionally, [\*/sys/power/disk\*](#) can be used to turn on one of the two testing modes of the suspend-to-disk mechanism: ‘testproc’ or ‘test’ . If the suspend-to-disk mechanism is in the ‘testproc’ mode, writing ‘disk’ to [\*/sys/power/state\*](#) will cause the kernel to disable nonboot CPUs and freeze tasks, wait for 5 seconds, unfreeze tasks and enable nonboot CPUs. If it is in the ‘test’ mode, writing ‘disk’ to [\*/sys/power/state\*](#) will cause the kernel to disable nonboot CPUs and freeze tasks, shrink memory, suspend devices, wait for 5 seconds, resume devices, unfreeze tasks and enable nonboot CPUs. Then, we are able to look in the log messages and work out, for example, which code is being slow and which device drivers are misbehaving.

The suspend-to-disk method may be chosen by writing to this file one of the accepted strings:

- ‘firmware’
- ‘platform’
- ‘shutdown’
- ‘reboot’
- ‘testproc’
- ‘test’

It will only change to ‘firmware’ or ‘platform’ if the system supports that.

### **/sys/power/image\_size**

Defined on file *sysfs-power*

The */sys/power/image\_size* file controls the size of the image created by the suspend-to-disk mechanism. It can be written a string representing a non-negative integer that will be used as an upper limit of the image size, in bytes. The kernel's suspend-to-disk code will do its best to ensure the image size will not exceed this number. However, if it turns out to be impossible, the kernel will try to suspend anyway using the smallest image possible. In particular, if "0" is written to this file, the suspend image will be as small as possible.

Reading from this file will display the current image size limit, which is set to around 2/5 of available RAM by default.

### **/sys/power/mem\_sleep**

Defined on file *sysfs-power*

The */sys/power/mem\_sleep* file controls the operating mode of system suspend. Reading from it returns the available modes as "s2idle" (always present), "shallow" and "deep" (present if supported). The mode that will be used on subsequent attempts to suspend the system (by writing "mem" to the */sys/power/state* file described above) is enclosed in square brackets.

Writing one of the above strings to this file causes the mode represented by it to be used on subsequent attempts to suspend the system.

See *System Sleep States* for more information.

### **/sys/power/pm\_async**

Defined on file *sysfs-power*

The */sys/power/pm\_async* file controls the switch allowing the user space to enable or disable asynchronous suspend and resume of devices. If enabled, this feature will cause some device drivers' suspend and resume callbacks to be executed in parallel with each other and with the main suspend thread. It is enabled if this file contains "1", which is the default. It may be disabled by writing "0" to this file, in which case all devices will be suspended and resumed synchronously.

### **/sys/power/pm\_debug\_messages**

Defined on file *sysfs-power*

The */sys/power/pm\_debug\_messages* file controls the printing of debug messages from the system suspend/hibermination infrastructure to the kernel log.

Writing a "1" to this file enables the debug messages and writing a "0" (default) to it disables them. Reads from this file return the current value.

### **/sys/power/pm\_print\_times**

Defined on file *sysfs-power*

The [\*/sys/power/pm\\_print\\_times\*](#) file allows user space to control whether the time taken by devices to suspend and resume is printed. These prints are useful for hunting down devices that take too long to suspend or resume.

Writing a “1” enables this printing while writing a “0” disables it. The default value is “0”. Reading from this file will display the current value.

---

### **/sys/power/pm\_trace**

Defined on file [\*sysfs-power\*](#)

The [\*/sys/power/pm\\_trace\*](#) file controls the code which saves the last PM event point in the RTC across reboots, so that you can debug a machine that just hangs during suspend (or more commonly, during resume). Namely, the RTC is only used to save the last PM event point if this file contains ‘1’. Initially it contains ‘0’ which may be changed to ‘1’ by writing a string representing a nonzero integer into it.

To use this debugging feature you should attempt to suspend the machine, then reboot it and run:

```
dmesg -s 1000000 | grep 'hash matches'
```

If you do not get any matches (or they appear to be false positives), it is possible that the last PM event point referred to a device created by a loadable kernel module. In this case cat [\*/sys/power/pm\\_trace\\_dev\\_match\*](#) (see below) after your system is started up and the kernel modules are loaded.

CAUTION: Using it will cause your machine’s real-time (CMOS) clock to be set to a random invalid time after a resume.

What; [\*/sys/power/pm\\_trace\\_dev\\_match\*](#) The [\*/sys/power/pm\\_trace\\_dev\\_match\*](#) file contains the name of the device associated with the last PM event point saved in the RTC across reboots when [\*pm\\_trace\*](#) has been used. More precisely it contains the list of current devices (including those registered by loadable kernel modules since boot) which match the device hash in the RTC at boot, with a newline after each one.

The advantage of this file over the hash matches printed to the kernel log (see [\*/sys/power/pm\\_trace\*](#)), is that it includes devices created after boot by loadable kernel modules.

Due to the small hash size necessary to fit in the RTC, it is possible that more than one device matches the hash, in which case further investigation is required to determine which device is causing the problem. Note that genuine RTC clock values (such as when [\*pm\\_trace\*](#) has not been used), can still match a device and output its name here.

---

### **/sys/power/pm\_wakeup\_irq**

Defined on file [\*sysfs-power\*](#)

The [\*/sys/power/pm\\_wakeup\\_irq\*](#) file reports to user space the IRQ number of the first wakeup interrupt (that is, the first interrupt from an IRQ line armed for system wakeup) seen by the kernel during the most recent system suspend/resume cycle.

This output is useful for system wakeup diagnostics of spurious wakeup interrupts.

### **/sys/power/reserved\_size**

Defined on file *sysfs-power*

The */sys/power/reserved\_size* file allows user space to control the amount of memory reserved for allocations made by device drivers during the “device freeze” stage of hibernation. It can be written a string representing a non-negative integer that will be used as the amount of memory to reserve for allocations made by device drivers’ “freeze” callbacks, in bytes.

Reading from this file will display the current value, which is set to 1 MB by default.

### **/sys/power/resume\_offset**

Defined on file *sysfs-power*

This file is used for telling the kernel an offset into a disk to use when hibernating the system such as with a swap file.

Reads from this file will display the current offset the kernel will be using on the next hibernation attempt.

Using this sysfs file will override any values that were set using the kernel command line for disk offset.

### **/sys/power/state**

Defined on file *sysfs-power*

The */sys/power/state* file controls system sleep states. Reading from this file returns the available sleep state labels, which may be “mem” (suspend), “standby” (power-on suspend), “freeze” (suspend-to-idle) and “disk” (hibernation).

Writing one of the above strings to this file causes the system to transition into the corresponding state, if available.

See *System Sleep States* for more information.

### **/sys/power/suspend\_stats**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats* directory contains suspend related statistics.

#### **/sys/power/suspend\_stats/fail**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/fail* file contains the number of times entering system sleep state failed.

### **/sys/power/suspend\_stats/failed\_freeze**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/failed\_freeze* file contains the number of times freezing processes failed.

### **/sys/power/suspend\_stats/failed\_prepare**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/failed\_prepare* file contains the number of times preparing all non-sysdev devices for a system PM transition failed.

### **/sys/power/suspend\_stats/failed\_resume**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/failed\_resume* file contains the number of times executing “resume” callbacks of non-sysdev devices failed.

### **/sys/power/suspend\_stats/failed\_resume\_early**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/failed\_resume\_early* file contains the number of times executing “early resume” callbacks of devices failed.

### **/sys/power/suspend\_stats/failed\_resume\_noirq**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/failed\_resume\_noirq* file contains the number of times executing “noirq resume” callbacks of devices failed.

### **/sys/power/suspend\_stats/failed\_suspend**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/failed\_suspend* file contains the number of times executing “suspend” callbacks of all non-sysdev devices failed.

### **/sys/power/suspend\_stats/failed\_suspend\_late**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/failed\_suspend\_late* file contains the number of times executing “late suspend” callbacks of all devices failed.

### **/sys/power/suspend\_stats/failed\_suspend\_noirq**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/failed\_suspend\_noirq* file contains the number of times executing “noirq suspend” callbacks of all devices failed.

### **/sys/power/suspend\_stats/last\_failed\_dev**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/last\_failed\_dev* file contains the last device for which a suspend/resume callback failed.

### **/sys/power/suspend\_stats/last\_failed\_errno**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/last\_failed\_errno* file contains the errno of the last failed attempt at entering system sleep state.

### **/sys/power/suspend\_stats/last\_failed\_step**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/last\_failed\_step* file contains the last failed step in the suspend/resume path.

### **/sys/power/suspend\_stats/success**

Defined on file *sysfs-power*

The */sys/power/suspend\_stats/success* file contains the number of times entering system sleep state succeeded.

### **/sys/power/sync\_on\_suspend**

Defined on file *sysfs-power*

This file controls whether or not the kernel will sync() filesystems during system suspend (after freezing user space and before suspending devices).

Writing a “1” to this file enables the sync() and writing a “0” disables it. Reads from the file return the current value. The default is “1” if the build-time “SUSPEND\_SKIP\_SYNC” config flag is unset, or “0” otherwise.

### **/sys/power/wake\_lock**

Defined on file *sysfs-power*

The `/sys/power/wake_lock` file allows user space to create wakeup source objects and activate them on demand (if one of those wakeup sources is active, reads from the `/sys/power/wakeup_count` file block or return false). When a string without white space is written to `/sys/power/wake_lock`, it will be assumed to represent a wakeup source name. If there is a wakeup source object with that name, it will be activated (unless active already). Otherwise, a new wakeup source object will be registered, assigned the given name and activated. If a string written to `/sys/power/wake_lock` contains white space, the part of the string preceding the white space will be regarded as a wakeup source name and handled as described above. The other part of the string will be regarded as a timeout (in nanoseconds) such that the wakeup source will be automatically deactivated after it has expired. The timeout, if present, is set regardless of the current state of the wakeup source object in question.

Reads from this file return a string consisting of the names of wakeup sources created with the help of it that are active at the moment, separated with spaces.

### **/sys/power/wake\_unlock**

Defined on file *sysfs-power*

The `/sys/power/wake_unlock` file allows user space to deactivate wakeup sources created with the help of `/sys/power/wake_lock`. When a string is written to `/sys/power/wake_unlock`, it will be assumed to represent the name of a wakeup source to deactivate.

If a wakeup source object of that name exists and is active at the moment, it will be deactivated.

Reads from this file return a string consisting of the names of wakeup sources created with the help of `/sys/power/wake_lock` that are inactive at the moment, separated with spaces.

### **/sys/power/wakeup\_count**

Defined on file *sysfs-power*

The `/sys/power/wakeup_count` file allows user space to put the system into a sleep state while taking into account the concurrent arrival of wakeup events. Reading from it returns the current number of registered wakeup events and it blocks if some wakeup events are being processed at the time the file is read from. Writing to it will only succeed if the current number of wakeup events is equal to the written value and, if successful, will make the kernel abort a subsequent transition to a sleep state if any wakeup events are reported after the write has returned.

### 5.2.29 Raise a uevent when a USB Host Controller has died

#### Raise a uevent when a USB Host Controller has died

Defined on file [usb-uevent](#)

When the USB Host Controller has entered a state where it is no longer functional a uevent will be raised. The uevent will contain ACTION=offline and ERROR=DEAD.

Here is an example taken using udevadm monitor -p:

```
KERNEL[130.428945] offline /devices/pci0000:00/0000:00:10.0/usb2
↳(usb)
ACTION=offline
BUSNUM=002
DEVNAME=/dev/bus/usb/002/001
DEVNUM=001
DEVPATH=/devices/pci0000:00/0000:00:10.0/usb2
DEVTYPE=usb_device
DRIVER=usb
ERROR=DEAD
MAJOR=189
MINOR=128
PRODUCT=1d6b/2/414
SEQNUM=2168
SUBSYSTEM=usb
TYPE=9/0/1
```

Users: [chromium-os-dev@chromium.org](mailto:chromium-os-dev@chromium.org)

### 5.2.30 Raise a uevent when a USB charger is inserted or removed

#### Raise a uevent when a USB charger is inserted or removed

Defined on file [usb-charger-uevent](#)

There are two USB charger states:

- USB\_CHARGER\_ABSENT
- USB\_CHARGER\_PRESENT

There are five USB charger types:

USB_CHARGER_UNKNOWN_TYPE	Charger type is unknown
USB_CHARGER_SDP_TYPE	Standard Downstream Port
USB_CHARGER_CDP_TYPE	Charging Downstream Port
USB_CHARGER_DCP_TYPE	Dedicated Charging Port
USB_CHARGER ACA_TYPE	Accessory Charging Adapter

<https://www.usb.org/document-library/battery-charging-v12-spec-and-adopters-agreement>

Here are two examples taken using `udevadm monitor -p` when USB charger is online:

```
UDEV change /devices/soc0/usbphynop1 (platform)
ACTION=change
DEVPATH=/devices/soc0/usbphynop1
DRIVER=usb_phy_generic
MODALIAS=of:Nusbphynop1T(null)Cusb-nop-xceiv
OF_COMPATIBLE_0=usb-nop-xceiv
OF_COMPATIBLE_N=1
OF_FULLNAME=/usbphynop1
OF_NAME=usbphynop1
SEQNUM=2493
SUBSYSTEM=platform
USB_CHARGER_STATE=USB_CHARGER_PRESENT
USB_CHARGER_TYPE=USB_CHARGER_SDP_TYPE
USEC_INITIALIZED=227422826
```

USB charger is offline:

```
KERNEL change /devices/soc0/usbphynop1 (platform)
ACTION=change
DEVPATH=/devices/soc0/usbphynop1
DRIVER=usb_phy_generic
MODALIAS=of:Nusbphynop1T(null)Cusb-nop-xceiv
OF_COMPATIBLE_0=usb-nop-xceiv
OF_COMPATIBLE_N=1
OF_FULLNAME=/usbphynop1
OF_NAME=usbphynop1
SEQNUM=2494
SUBSYSTEM=platform
USB_CHARGER_STATE=USB_CHARGER_ABSENT
USB_CHARGER_TYPE=USB_CHARGER_UNKNOWN_TYPE
```

### 5.2.31 nvdimm

#### nvdimm

Defined on file [sysfs-bus-nvdimm](#)

The libnvdimm sub-system implements a common sysfs interface for platform nvdimm resources. See Documentation/driver-api/nvdimm/.

### 5.2.32 Symbols under security/evm

#### **security/evm**

Defined on file [evm](#)

EVM protects a file's security extended attributes(xattrs) against integrity attacks. The initial method maintains an HMAC-sha1 value across the extended attributes, storing the value as the extended attribute 'security.evm' .

EVM supports two classes of security.evm. The first is an HMAC-sha1 generated locally with a trusted/encrypted key stored in the Kernel Key Retention System. The second is a digital signature generated either locally or remotely using an asymmetric key. These keys are loaded onto root's keyring using keyctl, and EVM is then enabled by echoing a value to <securityfs>/evm made up of the following bits:

Bit	Effect
0	Enable HMAC validation and creation
1	Enable digital signature validation
2	Permit modification of EVM-protected metadata at runtime. Not supported if HMAC validation and creation is enabled.
31	Disable further runtime modification of EVM policy

For example:

```
echo 1 ><securityfs>/evm
```

will enable HMAC validation and creation

```
echo 0x80000003 ><securityfs>/evm
```

will enable HMAC and digital signature validation and HMAC creation and disable all further modification of policy

```
echo 0x80000006 ><securityfs>/evm
```

will enable digital signature validation, permit modification of EVM-protected metadata and disable all further modification of policy

Echoing a value is additive, the new value is added to the existing initialization flags.

For example, after:

```
echo 2 ><securityfs>/evm
```

another echo can be performed:

```
echo 1 ><securityfs>/evm
```

and the resulting value will be 3.

Note that once an HMAC key has been loaded, it will no longer be possible to enable metadata modification. Signaling that an HMAC key has been loaded will clear the corresponding flag. For example, if the current value is 6 (2 and 4 set):

```
echo 1 ><securityfs>/evm
```

will set the new value to 3 (4 cleared).

Loading an HMAC key is the only way to disable metadata modification.

Until key loading has been signaled EVM can not create or validate the ‘security.evm’ xattr, but returns INTEGRITY\_UNKNOWN. Loading keys and signaling EVM should be done as early as possible. Normally this is done in the initramfs, which has already been measured as part of the trusted boot. For more information on creating and loading existing trusted/encrypted keys, refer to: /security/keys/trusted-encrypted. Both dracut (via 97masterkey and 98integrity) and systemd (via core/ima-setup) have support for loading keys at boot time.

### 5.2.33 Symbols under security/ima

#### **security/ima/policy**

Defined on file *ima\_policy*

The Trusted Computing Group(TCG) runtime Integrity Measurement Architecture(IMA) maintains a list of hash values of executables and other sensitive system files loaded into the run-time of this system. At runtime, the policy can be constrained based on LSM specific data. Policies are loaded into the securityfs file *ima/policy* by opening the file, writing the rules one at a time and then closing the file. The new policy takes effect after the file *ima/policy* is closed.

IMA appraisal, if configured, uses these file measurements for local measurement appraisal.

```
rule format: action [condition ...]

action: measure | dont_measure | appraise | dont_appraise |
        audit | hash | dont_hash
condition:= base | lsm [option]
base:   [[func=] [mask=] [fsmagic=] [fsuuid=] [uid=]
         [euid=] [fowner=] [fsname=]]
lsm:    [[subj_user=] [subj_role=] [subj_type=]
         [obj_user=] [obj_role=] [obj_type=]]
option: [[appraise_type=]] [template=] [permit_directio]
        [appraise_flag=] [keyrings=]
base:
       func:= [BPRM_CHECK][MMAP_CHECK][CREDS_CHECK][FILE_
→CHECK]MODULE_CHECK
       [FIRMWARE_CHECK]
```

(continues on next page)

(continued from previous page)

```

        [KEXEC_KERNEL_CHECK] [KEXEC_INITRAMFS_CHECK]
        [KEXEC_CMDLINE] [KEY_CHECK]
mask:= [[^]MAY_READ] [[^]MAY_WRITE] [[^]MAY_APPEND]
        [[^]MAY_EXEC]
fsmagic:= hex value
fsuuid:= file system UUID (e.g 8bcbe394-4f13-4144-be8e-
↪5aa9ea2ce2f6)
uid:= decimal value
euid:= decimal value
fowner:= decimal value
lsm: are LSM specific
option:
    appraise_type:= [imasig] [imasig|modsig]
    appraise_flag:= [check_blacklist]
    Currently, blacklist check is only for files signed with ↴
↪appended
    signature.
keyrings:= list of keyrings
(eg, .builtin_trusted_keys|.ima). Only valid
when action is "measure" and func is KEY_CHECK.
template:= name of a defined IMA template type
(eg, ima-ng). Only valid when action is "measure".
pcr:= decimal value

default policy:
    # PROC_SUPER_MAGIC
    dont_measure fsmagic=0x9fa0
    dont_appraise fsmagic=0x9fa0
    # SYSFS_MAGIC
    dont_measure fsmagic=0x62656572
    dont_appraise fsmagic=0x62656572
    # DEBUGFS_MAGIC
    dont_measure fsmagic=0x64626720
    dont_appraise fsmagic=0x64626720
    # TMPFS_MAGIC
    dont_measure fsmagic=0x01021994
    dont_appraise fsmagic=0x01021994
    # RAMFS_MAGIC
    dont_appraise fsmagic=0x858458f6
    # DEVPTS_SUPER_MAGIC
    dont_measure fsmagic=0x1cd1
    dont_appraise fsmagic=0x1cd1
    # BINfmtFS_MAGIC
    dont_measure fsmagic=0x42494e4d
    dont_appraise fsmagic=0x42494e4d
    # SECURITYFS_MAGIC
    dont_measure fsmagic=0x73636673
    dont_appraise fsmagic=0x73636673
    # SELINUX_MAGIC

```

(continues on next page)

(continued from previous page)

```

dont_measure fsmagic=0xf97cff8c
dont_appraise fsmagic=0xf97cff8c
# CGROUP_SUPER_MAGIC
dont_measure fsmagic=0x27e0eb
dont_appraise fsmagic=0x27e0eb
# NFS_MAGIC
dont_measure fsmagic=0x6e736673
dont_appraise fsmagic=0x6e736673

measure func=BPRM_CHECK
measure func=FILE_MMAP mask=MAY_EXEC
measure func=FILE_CHECK mask=MAY_READ uid=0
measure func=MODULE_CHECK
measure func=FIRMWARE_CHECK
appraise fowner=0

```

The default policy measures all executables in bprm\_check, all files mmapped executable in file mmap, and all files open for read by root in do\_filp\_open. The default appraisal policy appraises all files owned by root.

Examples of LSM specific definitions:

SELinux:

```

dont_measure obj_type=var_log_t
dont_appraise obj_type=var_log_t
dont_measure obj_type=auditd_log_t
dont_appraise obj_type=auditd_log_t
measure subj_user=system_u func=FILE_CHECK mask=MAY_READ
measure subj_role=system_r func=FILE_CHECK mask=MAY_READ

```

Smack:

```
measure subj_user=_ func=FILE_CHECK mask=MAY_READ
```

Example of measure rules using alternate PCRs:

```

measure func=KEXEC_KERNEL_CHECK pcr=4
measure func=KEXEC_INITRAMFS_CHECK pcr=5

```

Example of appraise rule allowing modsig appended signatures:

```
appraise func=KEXEC_KERNEL_CHECK appraise_type=imasig|modsig
```

Example of measure rule using KEY\_CHECK to measure all keys:

```
measure func=KEY_CHECK
```

Example of measure rule using KEY\_CHECK to only measure keys added to .builtin\_trusted\_keys or .ima keyring:

```
measure func=KEY_CHECK keyrings=.builtin_trusted_keys|.ima
```

### 5.2.34 Symbols under security/integrity

#### **security/integrity/evm/evm\_xattrs**

Defined on file *evm*

Shows the set of extended attributes used to calculate or validate the EVM signature, and allows additional attributes to be added at runtime. Any signatures generated after additional attributes are added (and on files possessing those additional attributes) will only be valid if the same additional attributes are configured on system boot. Writing a single period (.) will lock the xattr list from any further modification.

### 5.2.35 File testing/configfs-acpi

Has the following ABI:

- */config/acpi*
- */config/acpi/table*

### 5.2.36 File testing/configfs-iio

Has the following ABI:

- */config/iio*
- */config/iio/triggers*
- */config/iio/triggers/hrtimers*
- */config/iio/devices*
- */config/iio/devices/dummy*

### 5.2.37 File testing/configfs-most

Has the following ABI:

- */sys/kernel/config/most\_<component>*
- */sys/kernel/config/most\_cdev/<link>*
- */sys/kernel/config/most\_video/<link>*
- */sys/kernel/config/most\_net/<link>*
- */sys/kernel/config/most\_sound/<card>*
- */sys/kernel/config/most\_sound/<card>/<link>*

### 5.2.38 File testing/configfs-rdma\_cm

Has the following ABI:

- */config/rdma\_cm*
- */config/rdma\_cm/<hca>/ports/<port-num>/default\_roce\_mode*
- */config/rdma\_cm/<hca>/ports/<port-num>/default\_roce\_tos*

### 5.2.39 File testing/configfs-spear-pcie-gadget

Has the following ABI:

- */config/pcie-gadget*

### 5.2.40 File testing/configfs-stp-policy

Has the following ABI:

- */config/stp-policy*
- */config/stp-policy/<device>.〈policy〉*
- */config/stp-policy/<device>.〈policy〉/device*
- */config/stp-policy/<device>.〈policy〉/<node>*
- */config/stp-policy/<device>.〈policy〉/<node>/masters*
- */config/stp-policy/<device>.〈policy〉/<node>/channels*

### 5.2.41 File testing/configfs-stp-policy-p\_sys-t

Has the following ABI:

- */config/stp-policy/<device>:p\_sys-t.〈policy〉/<node>/uuid*
- */config/stp-policy/<device>:p\_sys-t.〈policy〉/<node>/do\_len*
- */config/stp-policy/<device>:p\_sys-t.〈policy〉/<node>/ts\_interval*
- */config/stp-policy/<device>:p\_sys-t.〈policy〉/<node>/clocksync\_interval*

### 5.2.42 File testing/configfs-usb-gadget

Has the following ABI:

- */config/usb-gadget*
- */config/usb-gadget/gadget*
- */config/usb-gadget/gadget/configs*
- */config/usb-gadget/gadget/configs/config*
- */config/usb-gadget/gadget/configs/config/strings*
- */config/usb-gadget/gadget/configs/config/strings/language*

- */config/usb-gadget/gadget/functions*
- */config/usb-gadget/gadget/functions/<func>.<inst>/interface.<n>*
- */config/usb-gadget/gadget/functions/<func>.<inst>/interface.<n>/<property>*
- */config/usb-gadget/gadget/strings*
- */config/usb-gadget/gadget/strings/language*
- */config/usb-gadget/gadget/os\_desc*

### **5.2.43 File testing/configfs-usb-gadget-acm**

Has the following ABI:

- */config/usb-gadget/gadget/functions/acm.name*

### **5.2.44 File testing/configfs-usb-gadget-ecm**

Has the following ABI:

- */config/usb-gadget/gadget/functions/ecm.name*

### **5.2.45 File testing/configfs-usb-gadget-eem**

Has the following ABI:

- */config/usb-gadget/gadget/functions/eem.name*

### **5.2.46 File testing/configfs-usb-gadget-ffs**

Has the following ABI:

- */config/usb-gadget/gadget/functions/ffs.name*

### **5.2.47 File testing/configfs-usb-gadget-hid**

Has the following ABI:

- */config/usb-gadget/gadget/functions/hid.name*

### **5.2.48 File testing/configfs-usb-gadget-loopback**

Has the following ABI:

- */config/usb-gadget/gadget/functions/Loopback.name*

## 5.2.49 File testing/configfs-usb-gadget-mass-storage

Has the following ABI:

- */config/usb-gadget/gadget/functions/mass\_storage.name*
- */config/usb-gadget/gadget/functions/mass\_storage.name/lun.name*

## 5.2.50 File testing/configfs-usb-gadget-midi

Has the following ABI:

- */config/usb-gadget/gadget/functions/midi.name*

## 5.2.51 File testing/configfs-usb-gadget-ncm

Has the following ABI:

- */config/usb-gadget/gadget/functions/ncm.name*

## 5.2.52 File testing/configfs-usb-gadget-obex

Has the following ABI:

- */config/usb-gadget/gadget/functions/obex.name*

## 5.2.53 File testing/configfs-usb-gadget-phonet

Has the following ABI:

- */config/usb-gadget/gadget/functions/phonet.name*

## 5.2.54 File testing/configfs-usb-gadget-printer

Has the following ABI:

- */config/usb-gadget/gadget/functions/printer.name*

## 5.2.55 File testing/configfs-usb-gadget-rndis

Has the following ABI:

- */config/usb-gadget/gadget/functions/rndis.name*

### 5.2.56 File testing/configfs-usb-gadget-serial

Has the following ABI:

- */config/usb-gadget/gadget/functions/gser.name*

### 5.2.57 File testing/configfs-usb-gadget-sourcesink

Has the following ABI:

- */config/usb-gadget/gadget/functions/SourceSink.name*

### 5.2.58 File testing/configfs-usb-gadget-subset

Has the following ABI:

- */config/usb-gadget/gadget/functions/geth.name*

### 5.2.59 File testing/configfs-usb-gadget-tcm

Has the following ABI:

- */config/usb-gadget/gadget/functions/tcm.name*

### 5.2.60 File testing/configfs-usb-gadget-uac1

Has the following ABI:

- */config/usb-gadget/gadget/functions/uac1.name*

### 5.2.61 File testing/configfs-usb-gadget-uac1\_legacy

Has the following ABI:

- */config/usb-gadget/gadget/functions/uac1\_legacy.name*

### 5.2.62 File testing/configfs-usb-gadget-uac2

Has the following ABI:

- */config/usb-gadget/gadget/functions/uac2.name*

### 5.2.63 File testing/configfs-usb-gadget-uvc

Has the following ABI:

- `/config/usb-gadget/gadget/functions/uvc.name`
- `/config/usb-gadget/gadget/functions/uvc.name/control`
- `/config/usb-gadget/gadget/functions/uvc.name/control/class`
- `/config/usb-gadget/gadget/functions/uvc.name/control/class/ss`
- `/config/usb-gadget/gadget/functions/uvc.name/control/class/fs`
- `/config/usb-gadget/gadget/functions/uvc.name/control/terminal`
- `/config/usb-gadget/gadget/functions/uvc.name/control/terminal/output`
- `/config/usb-gadget/gadget/functions/uvc.name/control/terminal/output/default`
- `/config/usb-gadget/gadget/functions/uvc.name/control/terminal/camera`
- `/config/usb-gadget/gadget/functions/uvc.name/control/terminal/camera/default`
- `/config/usb-gadget/gadget/functions/uvc.name/control/processing`
- `/config/usb-gadget/gadget/functions/uvc.name/control/processing/default`
- `/config/usb-gadget/gadget/functions/uvc.name/control/header`
- `/config/usb-gadget/gadget/functions/uvc.name/control/header/name`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/class`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/class/ss`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/class/hs`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/class/fs`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/color_matching`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/color_matching/default`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/mjpeg`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/mjpeg/name`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/mjpeg/name/name`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/uncompressed`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/uncompressed/name`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/uncompressed/name/name`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/header`
- `/config/usb-gadget/gadget/functions/uvc.name/streaming/header/name`
- `/sys/class/udc/udc.name/device/gadget/video4linux/video.name/function_name`

### **5.2.64 File testing/debugfs-cec-error-inj**

Has the following ABI:

- */sys/kernel/debug/cec/\*/error-inj*

### **5.2.65 File testing/debugfs-cros-ec**

Has the following ABI:

- */sys/kernel/debug/<cros-ec-device>/console\_log*
- */sys/kernel/debug/<cros-ec-device>/panicinfo*
- */sys/kernel/debug/<cros-ec-device>/pdinfo*
- */sys/kernel/debug/<cros-ec-device>/uptime*
- */sys/kernel/debug/<cros-ec-device>/last\_resume\_result*

### **5.2.66 File testing/debugfs-driver-genwqe**

Has the following ABI:

- */sys/kernel/debug/genwqe/genwqe<n>\_card/ddcb\_info*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/curr\_regs*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/curr\_dbg\_uid0*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/curr\_dbg\_uid1*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/curr\_dbg\_uid2*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/prev\_regs*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/prev\_dbg\_uid0*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/prev\_dbg\_uid1*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/prev\_dbg\_uid2*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/info*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/err\_inject*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/vf<0..14>\_jobtimeout\_msec*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/jobtimer*
- */sys/kernel/debug/genwqe/genwqe<n>\_card/queue\_working\_time*

### 5.2.67 File testing/debugfs-driver-habanalabs

Has the following ABI:

- `/sys/kernel/debug/habanalabs/hl<n>/addr`
- `/sys/kernel/debug/habanalabs/hl<n>/clk_gate`
- `/sys/kernel/debug/habanalabs/hl<n>/command_buffers`
- `/sys/kernel/debug/habanalabs/hl<n>/command_submission`
- `/sys/kernel/debug/habanalabs/hl<n>/command_submission_jobs`
- `/sys/kernel/debug/habanalabs/hl<n>/data32`
- `/sys/kernel/debug/habanalabs/hl<n>/data64`
- `/sys/kernel/debug/habanalabs/hl<n>/device`
- `/sys/kernel/debug/habanalabs/hl<n>/engines`
- `/sys/kernel/debug/habanalabs/hl<n>/i2c_addr`
- `/sys/kernel/debug/habanalabs/hl<n>/i2c_bus`
- `/sys/kernel/debug/habanalabs/hl<n>/i2c_data`
- `/sys/kernel/debug/habanalabs/hl<n>/i2c_reg`
- `/sys/kernel/debug/habanalabs/hl<n>/led0`
- `/sys/kernel/debug/habanalabs/hl<n>/led1`
- `/sys/kernel/debug/habanalabs/hl<n>/led2`
- `/sys/kernel/debug/habanalabs/hl<n>/mmu`
- `/sys/kernel/debug/habanalabs/hl<n>/set_power_state`
- `/sys/kernel/debug/habanalabs/hl<n>/userptr`
- `/sys/kernel/debug/habanalabs/hl<n>/vm`
- `/sys/kernel/debug/habanalabs/hl<n>/stop_on_err`

### 5.2.68 File testing/debugfs-ec

Has the following ABI:

- `/sys/kernel/debug/ec/*/{gpe,use_global_lock,io}`

### 5.2.69 File testing/debugfs-hisi-hpre

Has the following ABI:

- `/sys/kernel/debug/hisi_hpre/<bdf>/cluster[0-3]/regs`
- `/sys/kernel/debug/hisi_hpre/<bdf>/cluster[0-3]/cluster_ctrl`
- `/sys/kernel/debug/hisi_hpre/<bdf>/rdclr_en`
- `/sys/kernel/debug/hisi_hpre/<bdf>/current_qm`
- `/sys/kernel/debug/hisi_hpre/<bdf>/regs`
- `/sys/kernel/debug/hisi_hpre/<bdf>/qm/regs`
- `/sys/kernel/debug/hisi_hpre/<bdf>/qm/current_q`
- `/sys/kernel/debug/hisi_hpre/<bdf>/qm/clear_enable`
- `/sys/kernel/debug/hisi_hpre/<bdf>/qm/err_irq`
- `/sys/kernel/debug/hisi_hpre/<bdf>/qm/aeq_irq`
- `/sys/kernel/debug/hisi_hpre/<bdf>/qm/abnormal_irq`
- `/sys/kernel/debug/hisi_hpre/<bdf>/qm/create_qp_err`
- `/sys/kernel/debug/hisi_hpre/<bdf>/qm(mb_err`
- `/sys/kernel/debug/hisi_hpre/<bdf>/qm/status`
- `/sys/kernel/debug/hisi_hpre/<bdf>/hpre_dfx/send_cnt`
- `/sys/kernel/debug/hisi_hpre/<bdf>/hpre_dfx/recv_cnt`
- `/sys/kernel/debug/hisi_hpre/<bdf>/hpre_dfx/send_busy_cnt`
- `/sys/kernel/debug/hisi_hpre/<bdf>/hpre_dfx/send_fail_cnt`
- `/sys/kernel/debug/hisi_hpre/<bdf>/hpre_dfx/invalid_req_cnt`
- `/sys/kernel/debug/hisi_hpre/<bdf>/hpre_dfx/overtime_thrhdl`
- `/sys/kernel/debug/hisi_hpre/<bdf>/hpre_dfx/over_thrhdl_cnt`

### 5.2.70 File testing/debugfs-hisi-sec

Has the following ABI:

- `/sys/kernel/debug/hisi_sec2/<bdf>/clear_enable`
- `/sys/kernel/debug/hisi_sec2/<bdf>/current_qm`
- `/sys/kernel/debug/hisi_sec2/<bdf>/qm/qm_regs`
- `/sys/kernel/debug/hisi_sec2/<bdf>/qm/current_q`
- `/sys/kernel/debug/hisi_sec2/<bdf>/qm/clear_enable`
- `/sys/kernel/debug/hisi_sec2/<bdf>/qm/err_irq`
- `/sys/kernel/debug/hisi_sec2/<bdf>/qm/aeq_irq`
- `/sys/kernel/debug/hisi_sec2/<bdf>/qm/abnormal_irq`

- `/sys/kernel/debug/hisi_sec2/<bdf>/qm/create_qp_err`
- `/sys/kernel/debug/hisi_sec2/<bdf>/qm(mb_err`
- `/sys/kernel/debug/hisi_sec2/<bdf>/qm/status`
- `/sys/kernel/debug/hisi_sec2/<bdf>/sec_dfx/send_cnt`
- `/sys/kernel/debug/hisi_sec2/<bdf>/sec_dfx/recv_cnt`
- `/sys/kernel/debug/hisi_sec2/<bdf>/sec_dfx/send_busy_cnt`
- `/sys/kernel/debug/hisi_sec2/<bdf>/sec_dfx/err_bd_cnt`
- `/sys/kernel/debug/hisi_sec2/<bdf>/sec_dfx/invalid_req_cnt`
- `/sys/kernel/debug/hisi_sec2/<bdf>/sec_dfx/done_flag_cnt`

### 5.2.71 File testing/debugfs-hisi-zip

Has the following ABI:

- `/sys/kernel/debug/hisi_zip/<bdf>/comp_core[01]/regs`
- `/sys/kernel/debug/hisi_zip/<bdf>/decomp_core[0-5]/regs`
- `/sys/kernel/debug/hisi_zip/<bdf>/clear_enable`
- `/sys/kernel/debug/hisi_zip/<bdf>/current_qm`
- `/sys/kernel/debug/hisi_zip/<bdf>/qm/regs`
- `/sys/kernel/debug/hisi_zip/<bdf>/qm/current_q`
- `/sys/kernel/debug/hisi_zip/<bdf>/qm/clear_enable`
- `/sys/kernel/debug/hisi_zip/<bdf>/qm/err_irq`
- `/sys/kernel/debug/hisi_zip/<bdf>/qm/aeq_irq`
- `/sys/kernel/debug/hisi_zip/<bdf>/qm/abnormal_irq`
- `/sys/kernel/debug/hisi_zip/<bdf>/qm/create_qp_err`
- `/sys/kernel/debug/hisi_zip/<bdf>/qm(mb_err`
- `/sys/kernel/debug/hisi_zip/<bdf>/qm/status`
- `/sys/kernel/debug/hisi_zip/<bdf>/zip_dfx/send_cnt`
- `/sys/kernel/debug/hisi_zip/<bdf>/zip_dfx/recv_cnt`
- `/sys/kernel/debug/hisi_zip/<bdf>/zip_dfx/send_busy_cnt`
- `/sys/kernel/debug/hisi_zip/<bdf>/zip_dfx/err_bd_cnt`

### 5.2.72 File testing/debugfs-hyperv

Has the following ABI:

- */sys/kernel/debug/hyperv/<UUID>/fuzz\_test\_state*
- */sys/kernel/debug/hyperv/<UUID>/delay/fuzz\_test\_buffer\_interrupt\_delay*
- */sys/kernel/debug/hyperv/<UUID>/delay/fuzz\_test\_message\_delay*

### 5.2.73 File testing/debugfs-ideapad

Has the following ABI:

- */sys/kernel/debug/ideapad/cfg*
- */sys/kernel/debug/ideapad/status*

### 5.2.74 File testing/debugfs-moxtet

Has the following ABI:

- */sys/kernel/debug/moxtet/input*
- */sys/kernel/debug/moxtet/output*

### 5.2.75 File testing/debugfs-olpc

Has the following ABI:

- */sys/kernel/debug/olpc-ec/cmd*

### 5.2.76 File testing/debugfs-pfo-nx-crypto

Has the following ABI:

- */sys/kernel/debug/nx-crypto/\**

### 5.2.77 File testing/debugfs-pktcdvd

Has the following ABI:

- */sys/kernel/debug/pktcdvd/pktcdvd[0-7]*

### 5.2.78 File testing/debugfs-turris-mox-rwtm

Has the following ABI:

- */sys/kernel/debug/turris-mox-rwtm/do\_sign*

### 5.2.79 File testing/debugfs-wilco-ec

Has the following ABI:

- */sys/kernel/debug/wilco\_ec/h1\_gpio*
- */sys/kernel/debug/wilco\_ec/raw*

### 5.2.80 File testing/dell-smbios-wmi

Has the following ABI:

- */dev/wmi/dell-smbios*

### 5.2.81 File testing/dev-kmsg

Has the following ABI:

- */dev/kmsg*

### 5.2.82 File testing/devlink-resource-mlxsw

Has the following ABI:

- */kvd/*
- */kvd/linear*
- */kvd/hash\_single*
- */kvd/hash\_double*

### 5.2.83 File testing/evm

Has the following ABI:

- *security/evm*
- *security/integrity/evm/evm\_xattrs*

### 5.2.84 File testing/gpio-cdev

Has the following ABI:

- */dev/gpiochip[0-9]+*

### 5.2.85 File testing/ima\_policy

Has the following ABI:

- *security/ima/policy*

### 5.2.86 File testing/ppc-memtrace

Has the following ABI:

- */sys/kernel/debug/powerpc/memtrace*
- */sys/kernel/debug/powerpc/memtrace/enable*
- */sys/kernel/debug/powerpc/memtrace/<node-id>*
- */sys/kernel/debug/powerpc/memtrace/<node-id>/size*
- */sys/kernel/debug/powerpc/memtrace/<node-id>/start*
- */sys/kernel/debug/powerpc/memtrace/<node-id>/trace*

### 5.2.87 File testing/procfs-diskstats

Has the following ABI:

- */proc/diskstats*

### 5.2.88 File testing/procfs-smaps\_rollup

Has the following ABI:

- */proc/pid/smmaps\_rollup*

### 5.2.89 File testing/pstore

Has the following ABI:

- */sys/fs/pstore/…(or /dev/pstore/…)*

### 5.2.90 File testing/rtc-cdev

Has the following ABI:

- `/dev/rtcX`

### 5.2.91 File testing/sysfs-ata

Has the following ABI:

- `/sys/class/ata_..`
- `/sys/class/ata_port/ataX/nr_pmp_links`
- `/sys/class/ata_port/ataX/idle_irq`
- `/sys/class/ata_port/ataX/port_no`
- `/sys/class/ata_link/linkX[.Y]/hw_sata_spd_limit`
- `/sys/class/ata_link/linkX[.Y]/sata_spd_limit`
- `/sys/class/ata_link/linkX[.Y]/sata_spd`
- `/sys/class/ata_device/devX[.Y].Z/spdn_cnt`
- `/sys/class/ata_device/devX[.Y].Z/gscr`
- `/sys/class/ata_device/devX[.Y].Z/ering`
- `/sys/class/ata_device/devX[.Y].Z/id`
- `/sys/class/ata_device/devX[.Y].Z/pio_mode`
- `/sys/class/ata_device/devX[.Y].Z/xfer_mode`
- `/sys/class/ata_device/devX[.Y].Z/dma_mode`
- `/sys/class/ata_device/devX[.Y].Z/class`
- `/sys/class/ata_device/devX[.Y].Z/trim`

### 5.2.92 File testing/sysfs-block

Has the following ABI:

- `/sys/block/<disk>/stat`
- `/sys/block/<disk>/<part>/stat`
- `/sys/block/<disk>/integrity/format`
- `/sys/block/<disk>/integrity/read_verify`
- `/sys/block/<disk>/integrity/tag_size`
- `/sys/block/<disk>/integrity/device_is_integrity_capable`
- `/sys/block/<disk>/integrity/protection_interval_bytes`
- `/sys/block/<disk>/integrity/write_generate`
- `/sys/block/<disk>/alignment_offset`

- `/sys/block/<disk>/<partition>/alignment_offset`
- `/sys/block/<disk>/queue/logical_block_size`
- `/sys/block/<disk>/queue/physical_block_size`
- `/sys/block/<disk>/queue/minimum_io_size`
- `/sys/block/<disk>/queue/optimal_io_size`
- `/sys/block/<disk>/queue/nomerges`
- `/sys/block/<disk>/discard_alignment`
- `/sys/block/<disk>/<partition>/discard_alignment`
- `/sys/block/<disk>/queue/discard_granularity`
- `/sys/block/<disk>/queue/discard_max_bytes`
- `/sys/block/<disk>/queue/discard_zeroes_data`
- `/sys/block/<disk>/queue/write_same_max_bytes`
- `/sys/block/<disk>/queue/write_zeroes_max_bytes`
- `/sys/block/<disk>/queue/zoned`
- `/sys/block/<disk>/queue/nr_zones`
- `/sys/block/<disk>/queue/max_active_zones`
- `/sys/block/<disk>/queue/max_open_zones`
- `/sys/block/<disk>/queue/chunk_sectors`
- `/sys/block/<disk>/queue/io_timeout`

### 5.2.93 File testing/sysfs-block-aoe

Has the following ABI:

- `/sys/block/etherd*/mac`
- `/sys/block/etherd*/netif`
- `/sys/block/etherd*/state`
- `/sys/block/etherd*/firmware-version`
- `/sys/block/etherd*/payload`

### 5.2.94 File testing/sysfs-block-bcache

Has the following ABI:

- `/sys/block/<disk>/bcache/unregister`
- `/sys/block/<disk>/bcache/clear_stats`
- `/sys/block/<disk>/bcache/cache`
- `/sys/block/<disk>/bcache/cache_hits`

- `/sys/block/<disk>/bcache/cache_misses`
- `/sys/block/<disk>/bcache/cache_hit_ratio`
- `/sys/block/<disk>/bcache/sequential_cutoff`
- `/sys/block/<disk>/bcache/bypassed`
- `/sys/block/<disk>/bcache/writeback`
- `/sys/block/<disk>/bcache/writeback_running`
- `/sys/block/<disk>/bcache/writeback_delay`
- `/sys/block/<disk>/bcache/writeback_percent`
- `/sys/block/<disk>/bcache/synchronous`
- `/sys/block/<disk>/bcache/discard`
- `/sys/block/<disk>/bcache/bucket_size`
- `/sys/block/<disk>/bcache/nbuckets`
- `/sys/block/<disk>/bcache/tree_depth`
- `/sys/block/<disk>/bcache/btree_cache_size`
- `/sys/block/<disk>/bcache/written`
- `/sys/block/<disk>/bcache/btree_written`

### 5.2.95 File testing/sysfs-block-device

Has the following ABI:

- `/sys/block/*/device/sw_activity`
- `/sys/block/*/device/unload_heads`
- `/sys/block/*/device/ncq_prio_enable`

### 5.2.96 File testing/sysfs-block-dm

Has the following ABI:

- `/sys/block/dm-<num>/dm/name`
- `/sys/block/dm-<num>/dm/uuid`
- `/sys/block/dm-<num>/dm/suspended`
- `/sys/block/dm-<num>/dm/rq_based_seq_io_merge_deadline`
- `/sys/block/dm-<num>/dm/use_blk_mq`

## 5.2.97 File testing/sysfs-block-loop

Has the following ABI:

- `/sys/block/loopX/loop/autoclear`
- `/sys/block/loopX/loop/backing_file`
- `/sys/block/loopX/loop/offset`
- `/sys/block/loopX/loop/sizelimit`
- `/sys/block/loopX/loop/partscan`
- `/sys/block/loopX/loop/dio`

## 5.2.98 File testing/sysfs-block-rnbd

Has the following ABI:

- `/sys/block/rnbd<N>/rnbd/unmap_device`
- `/sys/block/rnbd<N>/rnbd/state`
- `/sys/block/rnbd<N>/rnbd/session`
- `/sys/block/rnbd<N>/rnbd/mapping_path`
- `/sys/block/rnbd<N>/rnbd/access_mode`

## 5.2.99 File testing/sysfs-block-rssd

Has the following ABI:

- `/sys/block/rssd*/status`

## 5.2.100 File testing/sysfs-block-zram

Has the following ABI:

- `/sys/block/zram<id>/disksize`
- `/sys/block/zram<id>/initstate`
- `/sys/block/zram<id>/reset`
- `/sys/block/zram<id>/max_comp_streams`
- `/sys/block/zram<id>/comp_algorithm`
- `/sys/block/zram<id>/mem_used_max`
- `/sys/block/zram<id>/mem_limit`
- `/sys/block/zram<id>/compact`
- `/sys/block/zram<id>/io_stat`
- `/sys/block/zram<id>/mm_stat`
- `/sys/block/zram<id>/debug_stat`

- */sys/block/zram<id>/backing\_dev*
- */sys/block/zram<id>/idle*
- */sys/block/zram<id>/writeback*
- */sys/block/zram<id>/bd\_stat*
- */sys/block/zram<id>/writeback\_limit\_enable*
- */sys/block/zram<id>/writeback\_limit*

### 5.2.101 File testing/sysfs-bus-acpi

Has the following ABI:

- */sys/bus/acpi/devices/…/path*
- */sys/bus/acpi/devices/…/modalias*
- */sys/bus/acpi/devices/…/hid*
- */sys/bus/acpi/devices/…/description*
- */sys/bus/acpi/devices/…/adr*
- */sys/bus/acpi/devices/…/uid*
- */sys/bus/acpi/devices/…/eject*
- */sys/bus/acpi/devices/…/status*
- */sys/bus/acpi/devices/…/hrv*

### 5.2.102 File testing/sysfs-bus-amba

Has the following ABI:

- */sys/bus/amba/devices/…/driver\_override*

### 5.2.103 File testing/sysfs-bus-bcma

Has the following ABI:

- */sys/bus/bcma/devices/…/manuf*
- */sys/bus/bcma/devices/…/id*
- */sys/bus/bcma/devices/…/rev*
- */sys/bus/bcma/devices/…/class*

### 5.2.104 File testing/sysfs-bus-coresight-devices-cti

Has the following ABI:

- `/sys/bus/coresight/devices/<cti-name>/enable`
- `/sys/bus/coresight/devices/<cti-name>/powered`
- `/sys/bus/coresight/devices/<cti-name>/ctmid`
- `/sys/bus/coresight/devices/<cti-name>/nr_trigger_cons`
- `/sys/bus/coresight/devices/<cti-name>/triggers<N>/name`
- `/sys/bus/coresight/devices/<cti-name>/triggers<N>/in_signals`
- `/sys/bus/coresight/devices/<cti-name>/triggers<N>/in_types`
- `/sys/bus/coresight/devices/<cti-name>/triggers<N>/out_signals`
- `/sys/bus/coresight/devices/<cti-name>/triggers<N>/out_types`
- `/sys/bus/coresight/devices/<cti-name>/regs/inout_sel`
- `/sys/bus/coresight/devices/<cti-name>/regs/inen`
- `/sys/bus/coresight/devices/<cti-name>/regs/outen`
- `/sys/bus/coresight/devices/<cti-name>/regs/gate`
- `/sys/bus/coresight/devices/<cti-name>/regs/asicctl`
- `/sys/bus/coresight/devices/<cti-name>/regs/intack`
- `/sys/bus/coresight/devices/<cti-name>/regs/appset`
- `/sys/bus/coresight/devices/<cti-name>/regs/appclear`
- `/sys/bus/coresight/devices/<cti-name>/regs/apppulse`
- `/sys/bus/coresight/devices/<cti-name>/regs/chinstatus`
- `/sys/bus/coresight/devices/<cti-name>/regs/choutstatus`
- `/sys/bus/coresight/devices/<cti-name>/regs/triginstatus`
- `/sys/bus/coresight/devices/<cti-name>/regs/trigoutstatus`
- `/sys/bus/coresight/devices/<cti-name>/channels/trigin_attach`
- `/sys/bus/coresight/devices/<cti-name>/channels/trigin_detach`
- `/sys/bus/coresight/devices/<cti-name>/channels/trigout_attach`
- `/sys/bus/coresight/devices/<cti-name>/channels/trigout_detach`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_gate_enable`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_gate_disable`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_set`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_clear`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_pulse`
- `/sys/bus/coresight/devices/<cti-name>/channels/trigout_filtered`

- `/sys/bus/coresight/devices/<cti-name>/channels/trig_filter_enable`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_inuse`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_free`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_xtrigs_sel`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_xtrigs_in`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_xtrigs_out`
- `/sys/bus/coresight/devices/<cti-name>/channels/chan_xtrigs_reset`

### 5.2.105 File testing/sysfs-bus-coresight-devices-etb10

Has the following ABI:

- `/sys/bus/coresight/devices/<memory_map>.etb/enable_sink`
- `/sys/bus/coresight/devices/<memory_map>.etb/trigger_cntr`
- `/sys/bus/coresight/devices/<memory_map>.etb/mgmt/rdp`
- `/sys/bus/coresight/devices/<memory_map>.etb/mgmt/sts`
- `/sys/bus/coresight/devices/<memory_map>.etb/mgmt/rrp`
- `/sys/bus/coresight/devices/<memory_map>.etb/mgmt/rwp`
- `/sys/bus/coresight/devices/<memory_map>.etb/mgmt/trg`
- `/sys/bus/coresight/devices/<memory_map>.etb/mgmt/ctl`
- `/sys/bus/coresight/devices/<memory_map>.etb/mgmt/ffsr`
- `/sys/bus/coresight/devices/<memory_map>.etb/mgmt/ffcr`

### 5.2.106 File testing/sysfs-bus-coresight-devices-etm3x

Has the following ABI:

- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/enable_source`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/addr_idx`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/addr_acctype`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/addr_range`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/addr_single`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/addr_start`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/addr_stop`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/cntr_idx`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/cntr_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/cntr_val`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/cntr_rld_val`

- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/cntr_rld_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/ctxid_idx`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/ctxid_mask`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/ctxid_pid`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/enable_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/etmsr`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/fifo_full_level`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mode`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/nr_addr_cmp`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/nr_cntr`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/nr_ctxid_cmp`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/reset`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/seq_12_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/seq_13_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/seq_21_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/seq_23_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/seq_31_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/seq_32_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/curr_seq_state`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/sync_freq`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/timestamp_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/traceid`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/trigger_event`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/cpu`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmccr`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmccer`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmscr`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmidr`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmcr`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmtraceidr`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmteevr`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmtsscr`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmtecr1`
- `/sys/bus/coresight/devices/<memory_map>.[etm|ptm]/mgmt/etmtecr2`

### 5.2.107 File testing/sysfs-bus-coresight-devices-etm4x

Has the following ABI:

- `/sys/bus/coresight/devices/etm<N>/enable_source`
- `/sys/bus/coresight/devices/etm<N>/cpu`
- `/sys/bus/coresight/devices/etm<N>/nr_pe_cmp`
- `/sys/bus/coresight/devices/etm<N>/nr_addr_cmp`
- `/sys/bus/coresight/devices/etm<N>/nr_cntr`
- `/sys/bus/coresight/devices/etm<N>/nr_ext_inp`
- `/sys/bus/coresight/devices/etm<N>/numcidc`
- `/sys/bus/coresight/devices/etm<N>/numvmidc`
- `/sys/bus/coresight/devices/etm<N>/nrseqstate`
- `/sys/bus/coresight/devices/etm<N>/nr_resource`
- `/sys/bus/coresight/devices/etm<N>/nr_ss_cmp`
- `/sys/bus/coresight/devices/etm<N>/reset`
- `/sys/bus/coresight/devices/etm<N>/mode`
- `/sys/bus/coresight/devices/etm<N>/pe`
- `/sys/bus/coresight/devices/etm<N>/event`
- `/sys/bus/coresight/devices/etm<N>/event_instre`
- `/sys/bus/coresight/devices/etm<N>/event_ts`
- `/sys/bus/coresight/devices/etm<N>/syncfreq`
- `/sys/bus/coresight/devices/etm<N>/cyc_threshold`
- `/sys/bus/coresight/devices/etm<N>/bb_ctrl`
- `/sys/bus/coresight/devices/etm<N>/event_vinst`
- `/sys/bus/coresight/devices/etm<N>/s_exlevel_vinst`
- `/sys/bus/coresight/devices/etm<N>/ns_exlevel_vinst`
- `/sys/bus/coresight/devices/etm<N>/addr_idx`
- `/sys/bus/coresight/devices/etm<N>/addr_instdatatype`
- `/sys/bus/coresight/devices/etm<N>/addr_single`
- `/sys/bus/coresight/devices/etm<N>/addr_range`
- `/sys/bus/coresight/devices/etm<N>/seq_idx`
- `/sys/bus/coresight/devices/etm<N>/seq_state`
- `/sys/bus/coresight/devices/etm<N>/seq_event`
- `/sys/bus/coresight/devices/etm<N>/seq_reset_event`
- `/sys/bus/coresight/devices/etm<N>/cntr_idx`

- `/sys/bus/coresight/devices/etm<N>/cntrldvr`
- `/sys/bus/coresight/devices/etm<N>/cntr_val`
- `/sys/bus/coresight/devices/etm<N>/cntr_ctrl`
- `/sys/bus/coresight/devices/etm<N>/res_idx`
- `/sys/bus/coresight/devices/etm<N>/res_ctrl`
- `/sys/bus/coresight/devices/etm<N>/ctxid_idx`
- `/sys/bus/coresight/devices/etm<N>/ctxid_pid`
- `/sys/bus/coresight/devices/etm<N>/ctxid_masks`
- `/sys/bus/coresight/devices/etm<N>/vmid_idx`

- `/sys/bus/coresight/devices/etm<N>/trcidr/trcidr11`
- `/sys/bus/coresight/devices/etm<N>/trcidr/trcidr12`
- `/sys/bus/coresight/devices/etm<N>/trcidr/trcidr13`

## 5.2.108 File testing/sysfs-bus-coresight-devices-funnel

Has the following ABI:

- `/sys/bus/coresight/devices/<memory_map>.funnel/funnel_ctrl`
- `/sys/bus/coresight/devices/<memory_map>.funnel/priority`

## 5.2.109 File testing/sysfs-bus-coresight-devices-stm

Has the following ABI:

- `/sys/bus/coresight/devices/<memory_map>.stm/enable_source`
- `/sys/bus/coresight/devices/<memory_map>.stm/hwevent_enable`
- `/sys/bus/coresight/devices/<memory_map>.stm/hwevent_select`
- `/sys/bus/coresight/devices/<memory_map>.stm/port_enable`
- `/sys/bus/coresight/devices/<memory_map>.stm/port_select`
- `/sys/bus/coresight/devices/<memory_map>.stm/status`
- `/sys/bus/coresight/devices/<memory_map>.stm/traceid`

## 5.2.110 File testing/sysfs-bus-coresight-devices-tmc

Has the following ABI:

- `/sys/bus/coresight/devices/<memory_map>.tmc/trigger_cntr`
- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/rsz`
- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/sts`
- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/rrp`
- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/rwp`
- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/trg`
- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/ctl`

- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/ffsr`
- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/ffcr`
- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/mode`
- `/sys/bus/coresight/devices/<memory_map>.tmc/mgmt/devid`
- `/sys/bus/coresight/devices/<memory_map>.tmc/buffer_size`

### 5.2.111 File testing/sysfs-bus-counter

Has the following ABI:

- `/sys/bus/counter/devices/counterX/countY/count`
- `/sys/bus/counter/devices/counterX/countY/ceiling`
- `/sys/bus/counter/devices/counterX/countY/floor`
- `/sys/bus/counter/devices/counterX/countY/count_mode`
- `/sys/bus/counter/devices/counterX/countY/count_mode_available`
- `/sys/bus/counter/devices/counterX/countY/error_noise_available`
- `/sys/bus/counter/devices/counterX/countY/function_available`
- `/sys/bus/counter/devices/counterX/countY/signalZ_action_available`
- `/sys/bus/counter/devices/counterX/countY/direction`
- `/sys/bus/counter/devices/counterX/countY/enable`
- `/sys/bus/counter/devices/counterX/countY/error_noise`
- `/sys/bus/counter/devices/counterX/countY/function`
- `/sys/bus/counter/devices/counterX/countY/name`
- `/sys/bus/counter/devices/counterX/countY/preset`
- `/sys/bus/counter/devices/counterX/countY/preset_enable`
- `/sys/bus/counter/devices/counterX/countY/signalZ_action`
- `/sys/bus/counter/devices/counterX/name`
- `/sys/bus/counter/devices/counterX/num_counts`
- `/sys/bus/counter/devices/counterX/num_signals`
- `/sys/bus/counter/devices/counterX/signalY/signal`
- `/sys/bus/counter/devices/counterX/signalY/name`

### 5.2.112 File testing/sysfs-bus-counter-104-quad-8

Has the following ABI:

- */sys/bus/counter/devices/counterX/signalY/cable\_fault*
- */sys/bus/counter/devices/counterX/signalY/cable\_fault\_enable*
- */sys/bus/counter/devices/counterX/signalY/filter\_clock\_prescaler*
- */sys/bus/counter/devices/counterX/signalY/index\_polarity*
- */sys/bus/counter/devices/counterX/signalY/index\_polarity\_available*
- */sys/bus/counter/devices/counterX/signalY/synchronous\_mode\_available*
- */sys/bus/counter/devices/counterX/signalY/synchronous\_mode*

### 5.2.113 File testing/sysfs-bus-counter-ftm-quaddec

Has the following ABI:

- */sys/bus/counter/devices/counterX/countY/prescaler\_available*
- */sys/bus/counter/devices/counterX/countY/prescaler*

### 5.2.114 File testing/sysfs-bus-css

Has the following ABI:

- */sys/bus/css/devices/…/type*
- */sys/bus/css/devices/…/modalias*
- */sys/bus/css/drivers/io\_subchannel/…/chpids*
- */sys/bus/css/drivers/io\_subchannel/…/pimpampom*
- */sys/bus/css/devices/…/driver\_override*

### 5.2.115 File testing/sysfs-bus-dfl

Has the following ABI:

- */sys/bus/dfl/devices/dfl\_dev.X/type*
- */sys/bus/dfl/devices/dfl\_dev.X/feature\_id*

### 5.2.116 File testing/sysfs-bus-event\_source-devices-dfl\_fme

Has the following ABI:

- `/sys/bus/event_source/devices/dfl_fmeX/format`
- `/sys/bus/event_source/devices/dfl_fmeX/cpumask`
- `/sys/bus/event_source/devices/dfl_fmeX/events`

### 5.2.117 File testing/sysfs-bus-event\_source-devices-events

Has the following ABI:

- `/sys/devices/cpu/events/`
- `/sys/bus/event_source/devices/<pmu>/events/<event>`
- `/sys/bus/event_source/devices/<pmu>/events/<event>.unit`
- `/sys/bus/event_source/devices/<pmu>/events/<event>.scale`

### 5.2.118 File testing/sysfs-bus-event\_source-devices-format

Has the following ABI:

- `/sys/bus/event_source/devices/<dev>/format`

### 5.2.119 File testing/sysfs-bus-event\_source-devices-hv\_24x7

Has the following ABI:

- `/sys/bus/event_source/devices/hv_24x7/format`
- `/sys/bus/event_source/devices/hv_24x7/interface/catalog`
- `/sys/bus/event_source/devices/hv_24x7/interface/catalog_length`
- `/sys/bus/event_source/devices/hv_24x7/interface/catalog_version`
- `/sys/devices/hv_24x7/interface/sockets`
- `/sys/devices/hv_24x7/interface/chipspersocket`
- `/sys/devices/hv_24x7/interface/coresperchip`
- `/sys/devices/hv_24x7/cpumask`
- `/sys/bus/event_source/devices/hv_24x7/event_descs/<event-name>`
- `/sys/bus/event_source/devices/hv_24x7/event_long_descs/<event-name>`

### 5.2.120 File testing/sysfs-bus-event\_source-devices-hv\_gpci

Has the following ABI:

- `/sys/bus/event_source/devices/hv_gpci/format`
- `/sys/bus/event_source/devices/hv_gpci/interface/collect_privileged`
- `/sys/bus/event_source/devices/hv_gpci/interface/ga`
- `/sys/bus/event_source/devices/hv_gpci/interface/expanded`
- `/sys/bus/event_source/devices/hv_gpci/interface/lab`
- `/sys/bus/event_source/devices/hv_gpci/interface/version`
- `/sys/bus/event_source/devices/hv_gpci/interface/kernel_version`
- `/sys/devices/hv_gpci/cpumask`

### 5.2.121 File testing/sysfs-bus-fcoe

Has the following ABI:

- `/sys/bus/fcoe/`
- `/sys/bus/fcoe/devices/ctlr_X`
- `/sys/bus/fcoe/devices/fcf_X`

### 5.2.122 File testing/sysfs-bus-fsi

Has the following ABI:

- `/sys/bus/platform/devices/./fsi-master/fsi0/rescan`
- `/sys/bus/platform/devices/./fsi-master/fsi0/break`
- `/sys/bus/platform/devices/./fsi-master/fsi0/slave@00:00/term`
- `/sys/bus/platform/devices/./fsi-master/fsi0/slave@00:00/raw`
- `/sys/bus/platform/devices/./cfam_reset`

### 5.2.123 File testing/sysfs-bus-fsl-mc

Has the following ABI:

- `/sys/bus/fsl-mc/drivers/…/bind`
- `/sys/bus/fsl-mc/drivers/…/unbind`

### 5.2.124 File testing/sysfs-bus-hsi

Has the following ABI:

- */sys/bus/hsi*
- */sys/bus/hsi/devices/…/modalias*

### 5.2.125 File testing/sysfs-bus-i2c-devices-bq32k

Has the following ABI:

- */sys/bus/i2c/devices/…/trickle\_charge\_bypass*

### 5.2.126 File testing/sysfs-bus-i2c-devices-fsa9480

Has the following ABI:

- */sys/bus/i2c/devices/…/device*
- */sys/bus/i2c/devices/…/switch*

### 5.2.127 File testing/sysfs-bus-i2c-devices-hm6352

Has the following ABI:

- */sys/bus/i2c/devices/…/heading0\_input*
- */sys/bus/i2c/devices/…/power\_state*
- */sys/bus/i2c/devices/…/calibration*

### 5.2.128 File testing/sysfs-bus-i2c-devices-lm3533

Has the following ABI:

- */sys/bus/i2c/devices/…/output\_hvled[n]*
- */sys/bus/i2c/devices/…/output\_lvled[n]*

### 5.2.129 File testing/sysfs-bus-i2c-devices-pca954x

Has the following ABI:

- */sys/bus/i2c/…/idle\_state*

### 5.2.130 File testing/sysfs-bus-i3c

Has the following ABI:

- `/sys/bus/i3c/devices/i3c-<bus-id>`
- `/sys/bus/i3c/devices/i3c-<bus-id>/current_master`
- `/sys/bus/i3c/devices/i3c-<bus-id>/mode`
- `/sys/bus/i3c/devices/i3c-<bus-id>/i3c_scl_frequency`
- `/sys/bus/i3c/devices/i3c-<bus-id>/i2c_scl_frequency`
- `/sys/bus/i3c/devices/i3c-<bus-id>/dynamic_address`
- `/sys/bus/i3c/devices/i3c-<bus-id>/bcr`
- `/sys/bus/i3c/devices/i3c-<bus-id>/dcr`
- `/sys/bus/i3c/devices/i3c-<bus-id>/pid`
- `/sys/bus/i3c/devices/i3c-<bus-id>/hdrcap`
- `/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>`
- `/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/dynamic_address`
- `/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/bcr`
- `/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/dcr`
- `/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/pid`
- `/sys/bus/i3c/devices/i3c-<bus-id>/<bus-id>-<device-pid>/hdrcap`
- `/sys/bus/i3c/devices/<bus-id>-<device-pid>`

### 5.2.131 File testing/sysfs-bus-iio

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX`
- `/sys/bus/iio/devices/triggerX`
- `/sys/bus/iio/devices/iio:deviceX/buffer`
- `/sys/bus/iio/devices/iio:deviceX/name`
- `/sys/bus/iio/devices/iio:deviceX/current_timestamp_clock`
- `/sys/bus/iio/devices/iio:deviceX/sampling_frequency`
- `/sys/bus/iio/devices/iio:deviceX/in_intensity_sampling_frequency`
- `/sys/bus/iio/devices/iio:deviceX/buffer/sampling_frequency`
- `/sys/bus/iio/devices/triggerX/sampling_frequency`
- `/sys/bus/iio/devices/iio:deviceX/sampling_frequency_available`
- `/sys/bus/iio/devices/iio:deviceX/in_intensity_sampling_frequency_available`
- `/sys/bus/iio/devices/iio:deviceX/in_proximity_sampling_frequency_available`

- `/sys/…/iio:deviceX/buffer/sampling_frequency_available`
- `/sys/bus/iio/devices/triggerX/sampling_frequency_available`
- `/sys/bus/iio/devices/iio:deviceX/oversampling_ratio`
- `/sys/bus/iio/devices/iio:deviceX/oversampling_ratio_available`
- `/sys/bus/iio/devices/iio:deviceX/in_voltageY_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_voltageY_supply_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_voltageY_i_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_voltageY_q_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_voltageY-voltageZ_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_currentY_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_currentY_supply_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_powerY_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_capacitanceY_raw`
- `/sys/…/iio:deviceX/in_capacitanceY-capacitanceZ_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_temp_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_tempX_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_temp_x_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_temp_y_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_temp_ambient_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_temp_object_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_tempX_input`
- `/sys/bus/iio/devices/iio:deviceX/in_accel_x_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_accel_y_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_accel_z_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_gravity_x_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_gravity_y_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_gravity_z_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_angl_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_positionrelative_x_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_positionrelative_y_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_anglvel_x_raw`
- `/sys/bus/iio/devices/iio:deviceX/in_anglvel_y_raw`

### 5.2.132 File testing/sysfs-bus-iio-accel-adxl372

Has the following ABI:

- `/sys/bus/iio/devices/triggerX/name = "adxl372-devX-peak"`

### 5.2.133 File testing/sysfs-bus-iio-accel-bmc150

Has the following ABI:

- `/sys/bus/iio/devices/triggerX/name = "bmc150_accel-any-motion-devX"`

### 5.2.134 File testing/sysfs-bus-iio-adc-ad7192

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/ac\_excitation\_en*
- */sys/bus/iio/devices/iio:deviceX/bridge\_switch\_en*
- */sys/bus/iio/devices/iio:deviceX/in\_voltagex\_sys\_calibration*
- */sys/bus/iio/devices/iio:deviceX/in\_voltage2-voltage2\_shorted\_raw*
- */sys/bus/iio/devices/iio:deviceX/in\_voltagex\_sys\_calibration\_mode\_available*
- */sys/bus/iio/devices/iio:deviceX/in\_voltagex\_sys\_calibration\_mode*

### 5.2.135 File testing/sysfs-bus-iio-adc-envelope-detector

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/in\_altvoltageY\_invert*
- */sys/bus/iio/devices/iio:deviceX/in\_altvoltageY\_compare\_interval*

### 5.2.136 File testing/sysfs-bus-iio-adc-hi8435

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/in\_voltageY\_sensing\_mode*
- */sys/bus/iio/devices/iio:deviceX/events/in\_voltageY\_thresh\_falling\_value*
- */sys/bus/iio/devices/iio:deviceX/events/in\_voltageY\_thresh\_rising\_value*

### 5.2.137 File testing/sysfs-bus-iio-adc-max9611

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/in\_power\_shunt\_resistor*
- */sys/bus/iio/devices/iio:deviceX/in\_current\_shunt\_resistor*

### 5.2.138 File testing/sysfs-bus-iio-adc-stm32

Has the following ABI:

- */sys/bus/iio/devices/triggerX/trigger\_polarity*
- */sys/bus/iio/devices/triggerX/trigger\_polarity\_available*

### 5.2.139 File testing/sysfs-bus-iio-chemical-vz89x

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/in_concentration_VOC_short_raw`

### 5.2.140 File testing/sysfs-bus-iio-counter-104-quad-8

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/in_count_count_mode_available`
- `/sys/bus/iio/devices/iio:deviceX/in_count_noise_error_available`
- `/sys/bus/iio/devices/iio:deviceX/in_count_quadrature_mode_available`
- `/sys/bus/iio/devices/iio:deviceX/in_index_index_polarity_available`
- `/sys/bus/iio/devices/iio:deviceX/in_index_synchronous_mode_available`
- `/sys/bus/iio/devices/iio:deviceX/in_countY_count_mode`
- `/sys/bus/iio/devices/iio:deviceX/in_countY_noise_error`
- `/sys/bus/iio/devices/iio:deviceX/in_countY_preset`
- `/sys/bus/iio/devices/iio:deviceX/in_countY_quadrature_mode`
- `/sys/bus/iio/devices/iio:deviceX/in_countY_set_to_preset_on_index`
- `/sys/bus/iio/devices/iio:deviceX/in_indexY_index_polarity`
- `/sys/bus/iio/devices/iio:deviceX/in_indexY_synchronous_mode`

### 5.2.141 File testing/sysfs-bus-iio-cros-ec

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/calibrate`
- `/sys/bus/iio/devices/iio:deviceX/location`
- `/sys/bus/iio/devices/iio:deviceX/id`

### 5.2.142 File testing/sysfs-bus-iio-dac-dpot-dac

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/out_voltageY_raw_available`

### 5.2.143 File testing/sysfs-bus-iio-dfsdm-adc-stm32

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/in_voltage_spi_clk_freq`

### 5.2.144 File testing/sysfs-bus-iio-distance-srf08

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/sensor_sensitivity`
- `/sys/bus/iio/devices/iio:deviceX/sensor_max_range`

### 5.2.145 File testing/sysfs-bus-iio-dma-buffer

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/buffer/length_align_bytes`

### 5.2.146 File testing/sysfs-bus-iio-frequency-ad9523

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/pll2_feedback_clk_present`
- `/sys/bus/iio/devices/iio:deviceX/pll2_reference_clk_present`
- `/sys/bus/iio/devices/iio:deviceX/pll1_reference_clk_a_present`
- `/sys/bus/iio/devices/iio:deviceX/pll1_reference_clk_b_present`
- `/sys/bus/iio/devices/iio:deviceX/pll1_reference_clk_test_present`
- `/sys/bus/iio/devices/iio:deviceX/vcxo_clk_present`
- `/sys/bus/iio/devices/iio:deviceX/pllY_locked`
- `/sys/bus/iio/devices/iio:deviceX/sync_dividers`

### 5.2.147 File testing/sysfs-bus-iio-frequency-adf4350

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/out_altvoltageY_frequency_resolution`
- `/sys/bus/iio/devices/iio:deviceX/out_altvoltageY_refin_frequency`

### 5.2.148 File testing/sysfs-bus-iio-frequency-adf4371

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_frequency*
- */sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_name*
- */sys/bus/iio/devices/iio:deviceX/out\_altvoltageY\_powerdown*

### 5.2.149 File testing/sysfs-bus-iio-gyro-bmg160

Has the following ABI:

- */sys/bus/iio/devices/triggerX/name = "bmg160-any-motion-devX"*

### 5.2.150 File testing/sysfs-bus-iio-health-afe440x

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/in\_intensityY\_raw*
- */sys/bus/iio/devices/iio:deviceX/in\_intensityY\_offset*
- */sys/bus/iio/devices/iio:deviceX/in\_intensityY\_resistance*
- */sys/bus/iio/devices/iio:deviceX/in\_intensityY\_capacitance*
- */sys/bus/iio/devices/iio:deviceX/out\_currentY\_raw*

### 5.2.151 File testing/sysfs-bus-iio-humidity-hdc100x

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/out\_current\_heater\_raw*
- */sys/bus/iio/devices/iio:deviceX/out\_current\_heater\_raw\_available*

### 5.2.152 File testing/sysfs-bus-iio-humidity-hdc2010

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/out\_current\_heater\_raw*
- */sys/bus/iio/devices/iio:deviceX/out\_current\_heater\_raw\_available*

### 5.2.153 File testing/sysfs-bus-iio-icm42600

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/in_accel_x_calibbias`
- `/sys/bus/iio/devices/iio:deviceX/in_accel_y_calibbias`
- `/sys/bus/iio/devices/iio:deviceX/in_accel_z_calibbias`
- `/sys/bus/iio/devices/iio:deviceX/in_anglvel_x_calibbias`
- `/sys/bus/iio/devices/iio:deviceX/in_anglvel_y_calibbias`
- `/sys/bus/iio/devices/iio:deviceX/in_anglvel_z_calibbias`
- `/sys/bus/iio/devices/iio:deviceX/in_accel_calibbias_available`
- `/sys/bus/iio/devices/iio:deviceX/in_anglvel_calibbias_available`

### 5.2.154 File testing/sysfs-bus-iio-impedance-analyzer-ad5933

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/out_altvoltageY_frequency_start`
- `/sys/bus/iio/devices/iio:deviceX/out_altvoltageY_frequency_increment`
- `/sys/bus/iio/devices/iio:deviceX/out_altvoltageY_frequency_points`
- `/sys/bus/iio/devices/iio:deviceX/out_altvoltageY_settling_cycles`

### 5.2.155 File testing/sysfs-bus-iio-ina2xx-adc

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/in_allow_async_readout`
- `/sys/bus/iio/devices/iio:deviceX/in_shunt_resistor`

### 5.2.156 File testing/sysfs-bus-iio-isl29501

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/in_proximity0_agc_gain`
- `/sys/bus/iio/devices/iio:deviceX/in_proximity0_agc_gain_bias`
- `/sys/bus/iio/devices/iio:deviceX/in_proximity0_calib_phase_temp_a`
- `/sys/bus/iio/devices/iio:deviceX/in_proximity0_calib_phase_temp_b`
- `/sys/bus/iio/devices/iio:deviceX/in_proximity0_calib_phase_light_a`
- `/sys/bus/iio/devices/iio:deviceX/in_proximity0_calib_phase_light_b`

## 5.2.157 File testing/sysfs-bus-iio-light-isl29018

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/proximity\_on\_chip\_ambient\_infrared\_suppression*

## 5.2.158 File testing/sysfs-bus-iio-light-lm3533-als

Has the following ABI:

- */sys/…/events/in\_illuminance0\_thresh\_either\_en*
- */sys/…/events/in\_illuminance0\_threshY\_hysteresis*
- */sys/…/events/illuminance\_threshY\_falling\_value*
- */sys/…/events/illuminance\_threshY\_raising\_value*
- */sys/bus/iio/devices/iio:deviceX/in\_illuminance0\_zone*
- */sys/bus/iio/devices/iio:deviceX/out\_currentY\_raw*
- */sys/bus/iio/devices/iio:deviceX/out\_currentY\_currentZ\_raw*

## 5.2.159 File testing/sysfs-bus-iio-light-si1133

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/in\_intensity\_ir\_small\_raw*
- */sys/bus/iio/devices/iio:deviceX/in\_intensity\_ir\_large\_raw*
- */sys/bus/iio/devices/iio:deviceX/in\_intensity\_large\_raw*

## 5.2.160 File testing/sysfs-bus-iio-light-tsl2583

Has the following ABI:

- */sys/bus/iio/devices/device[n]/in\_illuminance\_calibrate*
- */sys/bus/iio/devices/device[n]/in\_illuminance\_lux\_table*
- */sys/bus/iio/devices/device[n]/in\_illuminance\_input\_target*

## 5.2.161 File testing/sysfs-bus-iio-light-tsl2772

Has the following ABI:

- */sys/bus/iio/devices/device[n]/in\_illuminance0\_calibrate*
- */sys/bus/iio/devices/device[n]/in\_proximity0\_calibrate*

## 5.2.162 File testing/sysfs-bus-iio-magnetometer-hmc5843

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/meas\_conf*
- */sys/bus/iio/devices/iio:deviceX/meas\_conf\_available*

## 5.2.163 File testing/sysfs-bus-iio-meas-spec

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/battery\_low*

## 5.2.164 File testing/sysfs-bus-iio-mpu6050

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/in\_gyro\_matrix*
- */sys/bus/iio/devices/iio:deviceX/in\_accel\_matrix*
- */sys/bus/iio/devices/iio:deviceX/in\_magn\_matrix*

## 5.2.165 File testing/sysfs-bus-iio-potentiometer-mcp4531

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/out\_resistance\_raw\_available*

## 5.2.166 File testing/sysfs-bus-iio-proximity

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/in\_proximity\_nearlevel*

## 5.2.167 File testing/sysfs-bus-iio-proximity-as3935

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/in\_proximity\_input*
- */sys/bus/iio/devices/iio:deviceX/sensor\_sensitivity*

## 5.2.168 File testing/sysfs-bus-iio-scd30

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/calibration\_auto\_enable*
- */sys/bus/iio/devices/iio:deviceX/calibration\_forced\_value*

## 5.2.169 File testing/sysfs-bus-iio-sps30

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/start\_cleaning*
- */sys/bus/iio/devices/iio:deviceX/cleaning\_period*
- */sys/bus/iio/devices/iio:deviceX/cleaning\_period\_available*

## 5.2.170 File testing/sysfs-bus-iio-sx9310

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/in\_proximity3\_comb\_raw*

## 5.2.171 File testing/sysfs-bus-iio-temperature-max31856

Has the following ABI:

- */sys/bus/iio/devices/iio:deviceX/fault\_oc*
- */sys/bus/iio/devices/iio:deviceX/fault\_ovuv*

## 5.2.172 File testing/sysfs-bus-iio-timer-stm32

Has the following ABI:

- */sys/bus/iio/devices/triggerX/master\_mode\_available*
- */sys/bus/iio/devices/triggerX/master\_mode*
- */sys/bus/iio/devices/triggerX/sampling\_frequency*
- */sys/bus/iio/devices/iio:deviceX/in\_count0\_preset*
- */sys/bus/iio/devices/iio:deviceX/in\_count\_enable\_mode\_available*
- */sys/bus/iio/devices/iio:deviceX/in\_count0\_enable\_mode*
- */sys/bus/iio/devices/iio:deviceX/in\_count\_trigger\_mode\_available*
- */sys/bus/iio/devices/iio:deviceX/in\_count0\_trigger\_mode*

### 5.2.173 File testing/sysfs-bus-iio-trigger-sysfs

Has the following ABI:

- `/sys/bus/iio/devices/triggerX/trigger_now`
- `/sys/bus/iio/devices/triggerX/name`
- `/sys/bus/iio/devices/iio_sysfs_trigger/add_trigger`
- `/sys/bus/iio/devices/iio_sysfs_trigger/remove_trigger`

### 5.2.174 File testing/sysfs-bus-iio-vf610

Has the following ABI:

- `/sys/bus/iio/devices/iio:deviceX/in_conversion_mode`
- `/sys/bus/iio/devices/iio:deviceX/out_conversion_mode`

### 5.2.175 File testing/sysfs-bus-intel\_th-devices-gth

Has the following ABI:

- `/sys/bus/intel_th/devices/<intel_th_id>-gth/masters/*`
- `/sys/bus/intel_th/devices/<intel_th_id>-gth/outputs/[0-7]_port`
- `/sys/bus/intel_th/devices/<intel_th_id>-gth/outputs/[0-7]_drop`
- `/sys/bus/intel_th/devices/<intel_th_id>-gth/outputs/[0-7]_null`
- `/sys/bus/intel_th/devices/<intel_th_id>-gth/outputs/[0-7]_flush`
- `/sys/bus/intel_th/devices/<intel_th_id>-gth/outputs/[0-7]_reset`
- `/sys/bus/intel_th/devices/<intel_th_id>-gth/outputs/[0-7]_smc freq`

### 5.2.176 File testing/sysfs-bus-intel\_th-devices-msc

Has the following ABI:

- `/sys/bus/intel_th/devices/<intel_th_id>-msc<msc-id>/wrap`
- `/sys/bus/intel_th/devices/<intel_th_id>-msc<msc-id>/mode`
- `/sys/bus/intel_th/devices/<intel_th_id>-msc<msc-id>/nr_pages`
- `/sys/bus/intel_th/devices/<intel_th_id>-msc<msc-id>/win_switch`
- `/sys/bus/intel_th/devices/<intel_th_id>-msc<msc-id>/stop_on_full`

### 5.2.177 File testing/sysfs-bus-intel\_th-devices-pti

Has the following ABI:

- */sys/bus/intel\_th/devices/<intel\_th\_id>-pti/mode*
- */sys/bus/intel\_th/devices/<intel\_th\_id>-pti/freerunning\_clock*
- */sys/bus/intel\_th/devices/<intel\_th\_id>-pti/clock\_divider*

### 5.2.178 File testing/sysfs-bus-intel\_th-output-devices

Has the following ABI:

- */sys/bus/intel\_th/devices/<intel\_th\_id>-<device><id>/active*
- */sys/bus/intel\_th/devices/<intel\_th\_id>-msc<msc-id>/port*

### 5.2.179 File testing/sysfs-bus-mcb

Has the following ABI:

- */sys/bus/mcb/devices/mcb:X*
- */sys/bus/mcb/devices/mcb:X/revision*
- */sys/bus/mcb/devices/mcb:X/minor*
- */sys/bus/mcb/devices/mcb:X/model*
- */sys/bus/mcb/devices/mcb:X/name*

### 5.2.180 File testing/sysfs-bus-mdio

Has the following ABI:

- */sys/bus/mdio\_bus/devices/…/statistics/*
- */sys/bus/mdio\_bus/devices/…/statistics/transfers*
- */sys/bus/mdio\_bus/devices/…/statistics/errors*
- */sys/bus/mdio\_bus/devices/…/statistics/writes*
- */sys/bus/mdio\_bus/devices/…/statistics/reads*
- */sys/bus/mdio\_bus/devices/…/statistics/transfers\_<addr>*
- */sys/bus/mdio\_bus/devices/…/statistics/errors\_<addr>*
- */sys/bus/mdio\_bus/devices/…/statistics/writes\_<addr>*
- */sys/bus/mdio\_bus/devices/…/statistics/reads\_<addr>*

### 5.2.181 File testing/sysfs-bus-media

Has the following ABI:

- `/sys/bus/media/devices/…/model`

### 5.2.182 File testing/sysfs-bus-mei

Has the following ABI:

- `/sys/bus/mei/devices/…/modalias`
- `/sys/bus/mei/devices/…/name`
- `/sys/bus/mei/devices/…/uuid`
- `/sys/bus/mei/devices/…/version`
- `/sys/bus/mei/devices/…/max_conn`
- `/sys/bus/mei/devices/…/fixed`
- `/sys/bus/mei/devices/…/vtag`
- `/sys/bus/mei/devices/…/max_len`

### 5.2.183 File testing/sysfs-bus-mmc

Has the following ABI:

- `/sys/bus/mmc/devices/…/rev`

### 5.2.184 File testing/sysfs-bus-most

Has the following ABI:

- `/sys/bus/most/devices/<dev>/description`
- `/sys/bus/most/devices/<dev>/interface`
- `/sys/bus/most/devices/<dev>/dci`
- `/sys/bus/most/devices/<dev>/dci/arb_address`
- `/sys/bus/most/devices/<dev>/dci/arb_value`
- `/sys/bus/most/devices/<dev>/dci/mep_eui48_hi`
- `/sys/bus/most/devices/<dev>/dci/mep_eui48_lo`
- `/sys/bus/most/devices/<dev>/dci/mep_eui48_mi`
- `/sys/bus/most/devices/<dev>/dci/mep_filter`
- `/sys/bus/most/devices/<dev>/dci/mep_hash0`
- `/sys/bus/most/devices/<dev>/dci/mep_hash1`
- `/sys/bus/most/devices/<dev>/dci/mep_hash2`
- `/sys/bus/most/devices/<dev>/dci/mep_hash3`

- `/sys/bus/most/devices/<dev>/dci/ni_state`
- `/sys/bus/most/devices/<dev>/dci/node_address`
- `/sys/bus/most/devices/<dev>/dci/node_position`
- `/sys/bus/most/devices/<dev>/dci/packet_bandwidth`
- `/sys/bus/most/devices/<dev>/dci/sync_ep`
- `/sys/bus/most/devices/<dev>/<channel>/`
- `/sys/bus/most/devices/<dev>/<channel>/available_datatypes`
- `/sys/bus/most/devices/<dev>/<channel>/available_directions`
- `/sys/bus/most/devices/<dev>/<channel>/number_of_packet_buffers`
- `/sys/bus/most/devices/<dev>/<channel>/number_of_stream_buffers`
- `/sys/bus/most/devices/<dev>/<channel>/size_of_packet_buffer`
- `/sys/bus/most/devices/<dev>/<channel>/size_of_stream_buffer`
- `/sys/bus/most/devices/<dev>/<channel>/set_number_of_buffers`
- `/sys/bus/most/devices/<dev>/<channel>/set_buffer_size`
- `/sys/bus/most/devices/<dev>/<channel>/set_direction`
- `/sys/bus/most/devices/<dev>/<channel>/set_datatype`
- `/sys/bus/most/devices/<dev>/<channel>/set_subbuffer_size`
- `/sys/bus/most/devices/<dev>/<channel>/set_packets_per_xact`
- `/sys/bus/most/devices/<dev>/<channel>/channel_starving`
- `/sys/bus/most/drivers/most_core/components`
- `/sys/bus/most/drivers/most_core/links`

### 5.2.185 File testing/sysfs-bus-moxtet-devices

Has the following ABI:

- `/sys/bus/moxtet/devices/moxtet-<name>.<addr>/module_description`
- `/sys/bus/moxtet/devices/moxtet-<name>.<addr>/module_id`
- `/sys/bus/moxtet/devices/moxtet-<name>.<addr>/module_name`

### 5.2.186 File testing/sysfs-bus-nfit

For all of the nmem device attributes under `nfit/*`, see the ‘NVDIMM Firmware Interface Table (NFIT)’ section in the ACPI specification (<http://www.uefi.org/specifications>) for more details.

Has the following ABI:

- `/sys/bus/nd/devices/nmemX/nfit/serial`
- `/sys/bus/nd/devices/nmemX/nfit/handle`

- */sys/bus/nd/devices/nmemX/nfit/device*
- */sys/bus/nd/devices/nmemX/nfit/rev\_id*
- */sys/bus/nd/devices/nmemX/nfit/phys\_id*
- */sys/bus/nd/devices/nmemX/nfit flags*
- */sys/bus/nd/devices/nmemX/nfit/format*
- */sys/bus/nd/devices/nmemX/nfit/format1*
- */sys/bus/nd/devices/nmemX/nfit/formats*
- */sys/bus/nd/devices/nmemX/nfit/vendor*
- */sys/bus/nd/devices/nmemX/nfit/dsm\_mask*
- */sys/bus/nd/devices/nmemX/nfit/family*
- */sys/bus/nd/devices/nmemX/nfit/id*
- */sys/bus/nd/devices/nmemX/nfit/subsystem\_vendor*
- */sys/bus/nd/devices/nmemX/nfit/subsystem\_rev\_id*
- */sys/bus/nd/devices/nmemX/nfit/subsystem\_device*
- */sys/bus/nd/devices/ndbusX/nfit/revision*
- */sys/bus/nd/devices/ndbusX/nfit/scrub*
- */sys/bus/nd/devices/ndbusX/nfit/hw\_error\_scrub*
- */sys/bus/nd/devices/ndbusX/nfit/dsm\_mask*
- */sys/bus/nd/devices/ndbusX/nfit/firmware\_activate\_noidle*
- */sys/bus/nd/devices/regionX/nfit/range\_index*

### 5.2.187 File testing/sysfs-bus-nvdimm

Has the following ABI:

- *nvdimm*

### 5.2.188 File testing/sysfs-bus-optee-devices

Has the following ABI:

- */sys/bus/tee/devices/optee-ta-<uuid>/*
- */sys/bus/tee/devices/optee-ta-<uuid>/need\_supplicant*

## 5.2.189 File testing/sysfs-bus-papr-pmem

Has the following ABI:

- `/sys/bus/nd/devices/nmemX/papr/flags`
- `/sys/bus/nd/devices/nmemX/papr/perf_stats`

## 5.2.190 File testing/sysfs-bus-pci

Has the following ABI:

- `/sys/bus/pci/drivers/…/bind`
- `/sys/bus/pci/drivers/…/unbind`
- `/sys/bus/pci/drivers/…/new_id`
- `/sys/bus/pci/drivers/…/remove_id`
- `/sys/bus/pci/rescan`
- `/sys/bus/pci/devices/…/msi_bus`
- `/sys/bus/pci/devices/…/msi_irqs/`
- `/sys/bus/pci/devices/…/msi_irqs/<N>`
- `/sys/bus/pci/devices/…/remove`
- `/sys/bus/pci/devices/…/pci_bus/…/rescan`
- `/sys/bus/pci/devices/…/rescan`
- `/sys/bus/pci/devices/…/reset`
- `/sys/bus/pci/devices/…/vpd`
- `/sys/bus/pci/devices/…/virtfnN`
- `/sys/bus/pci/devices/…/dep_link`
- `/sys/bus/pci/devices/…/physfn`
- `/sys/bus/pci/slots/…/module`
- `/sys/bus/pci/devices/…/label`
- `/sys/bus/pci/devices/…/index`
- `/sys/bus/pci/devices/…/acpi_index`
- `/sys/bus/pci/devices/…/d3cold_allowed`
- `/sys/bus/pci/devices/…/sriov_totalvfs`
- `/sys/bus/pci/devices/…/sriov_numvfs`
- `/sys/bus/pci/devices/…/driver_override`
- `/sys/bus/pci/devices/…/numa_node`
- `/sys/bus/pci/devices/…/revision`
- `/sys/bus/pci/devices/…/sriov_drivers_autoprobe`

- `/sys/bus/pci/devices/…/p2pmem/size`
- `/sys/bus/pci/devices/…/p2pmem/available`
- `/sys/bus/pci/devices/…/p2pmem/published`
- `/sys/bus/pci/devices/…/link/clkpm`

### 5.2.191 File testing/sysfs-bus-pci-devices-aer\_stats

PCIe Device AER statistics

These attributes show up under all the devices that are AER capable. These statistical counters indicate the errors “as seen/reported by the device”. Note that this may mean that if an endpoint is causing problems, the AER counters may increment at its link partner (e.g. root port) because the errors may be “seen” / reported by the link partner and not the problematic endpoint itself (which may report all counters as 0 as it never saw any problems).

Has the following ABI:

- `/sys/bus/pci/devices/<dev>/aer_dev_correctable`
- `/sys/bus/pci/devices/<dev>/aer_dev_fatal`
- `/sys/bus/pci/devices/<dev>/aer_dev_nonfatal`
- `/sys/bus/pci/devices/<dev>/aer_stats/aer_rootport_total_err_cor`
- `/sys/bus/pci/devices/<dev>/aer_stats/aer_rootport_total_err_fatal`
- `/sys/bus/pci/devices/<dev>/aer_stats/aer_rootport_total_err_nonfatal`

### 5.2.192 File testing/sysfs-bus-pci-devices-catpt

Has the following ABI:

- `/sys/devices/pci0000:00/<dev>/fw_version`
- `/sys/devices/pci0000:00/<dev>/fw_info`

### 5.2.193 File testing/sysfs-bus-pci-devices-cciss

Has the following ABI:

- `/sys/bus/pci/devices/<dev>/ccissX/cXdY/model`
- `/sys/bus/pci/devices/<dev>/ccissX/cXdY/rev`
- `/sys/bus/pci/devices/<dev>/ccissX/cXdY/unique_id`
- `/sys/bus/pci/devices/<dev>/ccissX/cXdY/vendor`
- `/sys/bus/pci/devices/<dev>/ccissX/cXdY/block:cciss!cXdY`
- `/sys/bus/pci/devices/<dev>/ccissX/rescan`
- `/sys/bus/pci/devices/<dev>/ccissX/cXdY/lunid`
- `/sys/bus/pci/devices/<dev>/ccissX/cXdY/raid_level`

- */sys/bus/pci/devices/<dev>/ccissX/cXdY/usage\_count*
- */sys/bus/pci/devices/<dev>/ccissX/resettable*
- */sys/bus/pci/devices/<dev>/ccissX/transport\_mode*

## **5.2.194 File testing/sysfs-bus-pci-drivers-ehci\_hcd**

Has the following ABI:

- */sys/bus/pci/drivers/ehci\_hcd/…/companion*

## **5.2.195 File testing/sysfs-bus-pci-drivers-janz-cmodio**

Has the following ABI:

- */sys/bus/pci/drivers/janz-cmodio/…/modulbus\_number*

## **5.2.196 File testing/sysfs-bus-pci-drivers-xhci\_hcd**

Has the following ABI:

- */sys/bus/pci/drivers/xhci\_hcd/…/dbc*

## **5.2.197 File testing/sysfs-bus-platform**

Has the following ABI:

- */sys/bus/platform/devices/…/driver\_override*
- */sys/bus/platform/devices/…/numa\_node*

## **5.2.198 File testing/sysfs-bus-rapidio**

Has the following ABI:

- */sys/bus/rapidio/devices/nn:d:iiii*
- */sys/bus/rapidio/devices/nn:d:iiii/did*
- */sys/bus/rapidio/devices/nn:d:iiii/vid*
- */sys/bus/rapidio/devices/nn:d:iiii/device\_rev*
- */sys/bus/rapidio/devices/nn:d:iiii/asm\_did*
- */sys/bus/rapidio/devices/nn:d:iiii/asm\_rev*
- */sys/bus/rapidio/devices/nn:d:iiii/asm\_vid*
- */sys/bus/rapidio/devices/nn:d:iiii/destid*
- */sys/bus/rapidio/devices/nn:d:iiii/lprev*
- */sys/bus/rapidio/devices/nn:d:iiii/modalias*
- */sys/bus/rapidio/devices/nn:d:iiii/config*

- `/sys/bus/rapidio/devices/nn:s:iiii/routes`
- `/sys/bus/rapidio/devices/nn:s:iiii/destid`
- `/sys/bus/rapidio/devices/nn:s:iiii/hopcount`
- `/sys/bus/rapidio/devices/nn:s:iiii/lnext`
- `/sys/bus/rapidio/devices/nn:s:iiii/errlog`
- `/sys/bus/rapidio/scan`

### 5.2.199 File testing/sysfs-bus-rbd

Has the following ABI:

- `/sys/bus/rbd/add`
- `/sys/bus/rbd/remove`
- `/sys/bus/rbd/add_single_major`
- `/sys/bus/rbd/remove_single_major`
- `/sys/bus/rbd/supported_features`
- `/sys/bus/rbd/devices/<dev-id>/size`
- `/sys/bus/rbd/devices/<dev-id>/major`
- `/sys/bus/rbd/devices/<dev-id>/client_id`
- `/sys/bus/rbd/devices/<dev-id>/pool`
- `/sys/bus/rbd/devices/<dev-id>/name`
- `/sys/bus/rbd/devices/<dev-id>/refresh`
- `/sys/bus/rbd/devices/<dev-id>/current_snap`
- `/sys/bus/rbd/devices/<dev-id>/pool_id`
- `/sys/bus/rbd/devices/<dev-id>/image_id`
- `/sys/bus/rbd/devices/<dev-id>/features`
- `/sys/bus/rbd/devices/<dev-id>/parent`
- `/sys/bus/rbd/devices/<dev-id>/minor`
- `/sys/bus/rbd/devices/<dev-id>/snap_id`
- `/sys/bus/rbd/devices/<dev-id>/config_info`
- `/sys/bus/rbd/devices/<dev-id>/cluster_fsid`
- `/sys/bus/rbd/devices/<dev-id>/client_addr`

### 5.2.200 File testing/sysfs-bus-rpmsg

Has the following ABI:

- */sys/bus/rpmsg/devices/…/name*
- */sys/bus/rpmsg/devices/…/src*
- */sys/bus/rpmsg/devices/…/dst*
- */sys/bus/rpmsg/devices/…/announce*
- */sys/bus/rpmsg/devices/…/driver\_override*

### 5.2.201 File testing/sysfs-bus-siox

Has the following ABI:

- */sys/bus/siox/devices/siox-X/active*
- */sys/bus/siox/devices/siox-X/device\_add*
- */sys/bus/siox/devices/siox-X/device\_remove*
- */sys/bus/siox/devices/siox-X/poll\_interval\_ns*
- */sys/bus/siox/devices/siox-X-Y/connected*
- */sys/bus/siox/devices/siox-X-Y/inbytes*
- */sys/bus/siox/devices/siox-X-Y/status\_errors*
- */sys/bus/siox/devices/siox-X-Y/type*
- */sys/bus/siox/devices/siox-X-Y/watchdog*
- */sys/bus/siox/devices/siox-X-Y/watchdog\_errors*
- */sys/bus/siox/devices/siox-X-Y/outbytes*

### 5.2.202 File testing/sysfs-bus-soundwire-master

Has the following ABI:

- */sys/bus/soundwire/devices/sdw-master-N/revision*

### 5.2.203 File testing/sysfs-bus-soundwire-slave

Has the following ABI:

- */sys/bus/soundwire/devices/sdw:…/status*
- */sys/bus/soundwire/devices/sdw:…/dev-properties/mipi\_revision*
- */sys/bus/soundwire/devices/sdw:…/dp0/max\_word*
- */sys/bus/soundwire/devices/sdw:…/dpN\_src/max\_word*

## 5.2.204 File testing/sysfs-bus-thunderbolt

Has the following ABI:

- `/sys/bus/thunderbolt/devices/…/domainX/boot_acl`
- `/sys/bus/thunderbolt/devices/…/domainX/iommu_dma_protection`
- `/sys/bus/thunderbolt/devices/…/domainX/security`
- `/sys/bus/thunderbolt/devices/…/authorized`
- `/sys/bus/thunderbolt/devices/…/boot`
- `/sys/bus/thunderbolt/devices/…/generation`
- `/sys/bus/thunderbolt/devices/…/key`
- `/sys/bus/thunderbolt/devices/…/device`
- `/sys/bus/thunderbolt/devices/…/device_name`
- `/sys/bus/thunderbolt/devices/…/rx_speed`
- `/sys/bus/thunderbolt/devices/…/rx_lanes`
- `/sys/bus/thunderbolt/devices/…/tx_speed`
- `/sys/bus/thunderbolt/devices/…/tx_lanes`
- `/sys/bus/thunderbolt/devices/…/vendor`
- `/sys/bus/thunderbolt/devices/…/vendor_name`
- `/sys/bus/thunderbolt/devices/…/unique_id`
- `/sys/bus/thunderbolt/devices/…/nvm_version`
- `/sys/bus/thunderbolt/devices/…/nvm_authenticate`
- `/sys/bus/thunderbolt/devices/<xdomain>.<service>/key`
- `/sys/bus/thunderbolt/devices/<xdomain>.<service>/modalias`
- `/sys/bus/thunderbolt/devices/<xdomain>.<service>/prtcid`
- `/sys/bus/thunderbolt/devices/<xdomain>.<service>/prtcvers`
- `/sys/bus/thunderbolt/devices/<xdomain>.<service>/prtcrevs`
- `/sys/bus/thunderbolt/devices/<xdomain>.<service>/prtcstns`
- `/sys/bus/thunderbolt/devices/<device>:<port>.<index>/device`
- `/sys/bus/thunderbolt/devices/<device>:<port>.<index>/nvm_authenticate`
- `/sys/bus/thunderbolt/devices/<device>:<port>.<index>/nvm_version`
- `/sys/bus/thunderbolt/devices/<device>:<port>.<index>/vendor`
- `/sys/bus/thunderbolt/devices/…/nvm_authenticate_on_disconnect`

### **5.2.205 File testing/sysfs-bus-typec**

Has the following ABI:

- */sys/bus/typec/devices/…/active*
- */sys/bus/typec/devices/…/description*
- */sys/bus/typec/devices/…/mode*
- */sys/bus/typec/devices/…/svid*
- */sys/bus/typec/devices/…/vdo*

### **5.2.206 File testing/sysfs-bus-umc**

Has the following ABI:

- */sys/bus/umc/*
- */sys/bus/umc/devices/…/capability\_id*
- */sys/bus/umc/devices/…/version*

### **5.2.207 File testing/sysfs-bus-usb**

Has the following ABI:

- */sys/bus/usb/devices/INTERFACE/authorized*
- */sys/bus/usb/devices/usbX/interfaceAuthorizedDefault*
- */sys/bus/usb/device/…/authorized*
- */sys/bus/usb/device/…/wusb\_cdid*
- */sys/bus/usb/device/…/wusb\_ck*
- */sys/bus/usb/device/…/wusb\_disconnect*
- */sys/bus/usb/drivers/…/new\_id*
- */sys/bus/usb-serial/drivers/…/new\_id*
- */sys/bus/usb/drivers/…/remove\_id*
- */sys/bus/usb/devices/…/power/usb2\_hardware\_lpm*
- */sys/bus/usb/devices/…/power/usb3\_hardware\_lpm\_u1*
- */sys/bus/usb/devices/…/ltm\_capable*
- */sys/bus/usb/devices/…/(hub interface)/portX*
- */sys/bus/usb/devices/…/(hub interface)/portX/connect\_type*
- */sys/bus/usb/devices/…/(hub interface)/portX/location*
- */sys/bus/usb/devices/…/(hub interface)/portX/quirks*
- */sys/bus/usb/devices/…/(hub interface)/portX/over\_current\_count*
- */sys/bus/usb/devices/…/(hub interface)/portX/usb3\_lpm\_permit*

- `/sys/bus/usb/devices/…/power/usb2_lpm_l1_timeout`
- `/sys/bus/usb/devices/…/power/usb2_lpm_besl`
- `/sys/bus/usb/devices/…/rx_lanes`
- `/sys/bus/usb/devices/…/tx_lanes`

## 5.2.208 File testing/sysfs-bus-usb-devices-usbseg

Has the following ABI:

- `/sys/bus/usb/…/powered`
- `/sys/bus/usb/…/mode_msb`
- `/sys/bus/usb/…/mode_lsb`
- `/sys/bus/usb/…/textmode`
- `/sys/bus/usb/…/text`
- `/sys/bus/usb/…/decimals`

## 5.2.209 File testing/sysfs-bus-usb-lvstest

Link Layer Validation Device is a standard device for testing of Super Speed Link Layer tests. These nodes are available in sysfs only when lvs driver is bound with root hub device.

Has the following ABI:

- `/sys/bus/usb/devices/…/get_dev_desc`
- `/sys/bus/usb/devices/…/u1_timeout`
- `/sys/bus/usb/devices/…/u2_timeout`
- `/sys/bus/usb/devices/…/hot_reset`
- `/sys/bus/usb/devices/…/u3_entry`
- `/sys/bus/usb/devices/…/u3_exit`
- `/sys/bus/usb/devices/…/enable_compliance`
- `/sys/bus/usb/devices/…/warm_reset`

## 5.2.210 File testing/sysfs-bus-vfio-mdev

Has the following ABI:

- `/sys/…/<device>/mdev_supported_types/`
- `/sys/…/<device>/mdev_supported_types/<type-id>/`
- `/sys/…/mdev_supported_types/<type-id>/create`
- `/sys/…/mdev_supported_types/<type-id>/devices/`
- `/sys/…/mdev_supported_types/<type-id>/available_instances`

- */sys/…/mdev\_supported\_types/<type-id>/device\_api*
- */sys/…/mdev\_supported\_types/<type-id>/name*
- */sys/…/mdev\_supported\_types/<type-id>/description*
- */sys/…/<device>/<UUID>/*
- */sys/…/<device>/<UUID>/mdev\_type*
- */sys/…/<device>/<UUID>/remove*

### **5.2.211 File testing/sysfs-bus-vmbus**

Has the following ABI:

- */sys/bus/vmbus/devices/…/driver\_override*

### **5.2.212 File testing/sysfs-c2port**

Has the following ABI:

- */sys/class/c2port/*
- */sys/class/c2port/c2portX*
- */sys/class/c2port/c2portX/access*
- */sys/class/c2port/c2portX/dev\_id*
- */sys/class/c2port/c2portX/flash\_access*
- */sys/class/c2port/c2portX/flash\_block\_size*
- */sys/class/c2port/c2portX/flash\_blocks\_num*
- */sys/class/c2port/c2portX/flash\_data*
- */sys/class/c2port/c2portX/flash\_erase*
- */sys/class/c2port/c2portX/reset*
- */sys/class/c2port/c2portX/rev\_id*

### **5.2.213 File testing/sysfs-cfq-target-latency**

Has the following ABI:

- */sys/block/<device>/iosched/target\_latency*

### 5.2.214 File testing/sysfs-class

Has the following ABI:

- </sys/class/>

### 5.2.215 File testing/sysfs-class-backlight

Has the following ABI:

- </sys/class/backlight/<backlight>/scale>
- [/sys/class/backlight/<backlight>/ambient\\_light\\_level](/sys/class/backlight/<backlight>/ambient_light_level)
- [/sys/class/backlight/<backlight>/ambient\\_light\\_zone](/sys/class/backlight/<backlight>/ambient_light_zone)

### 5.2.216 File testing/sysfs-class-backlight-adp5520

sysfs interface for analog devices adp5520(01) backlight driver

The backlight brightness control operates at three different levels for the adp5520 and adp5501 devices: daylight (level 1), office (level 2) and dark (level 3). By default the brightness operates at the daylight brightness level.

Has the following ABI:

- [/sys/class/backlight/<backlight>/daylight\\_max](/sys/class/backlight/<backlight>/daylight_max)
- [/sys/class/backlight/<backlight>/office\\_max](/sys/class/backlight/<backlight>/office_max)
- [/sys/class/backlight/<backlight>/dark\\_max](/sys/class/backlight/<backlight>/dark_max)
- [/sys/class/backlight/<backlight>/daylight\\_dim](/sys/class/backlight/<backlight>/daylight_dim)
- [/sys/class/backlight/<backlight>/office\\_dim](/sys/class/backlight/<backlight>/office_dim)
- [/sys/class/backlight/<backlight>/dark\\_dim](/sys/class/backlight/<backlight>/dark_dim)

### 5.2.217 File testing/sysfs-class-backlight-adp8860

sysfs interface for analog devices adp8860 backlight driver

The backlight brightness control operates at three different levels for the adp8860, adp8861 and adp8863 devices: daylight (level 1), office (level 2) and dark (level 3). By default the brightness operates at the daylight brightness level.

See also [/sys/class/backlight/<backlight>/ambient\\_light\\_level](/sys/class/backlight/<backlight>/ambient_light_level) and [/sys/class/backlight/<backlight>/ambient\\_light\\_zone](/sys/class/backlight/<backlight>/ambient_light_zone).

Has the following ABI:

- [/sys/class/backlight/<backlight>/l1\\_daylight\\_max](/sys/class/backlight/<backlight>/l1_daylight_max)
- [/sys/class/backlight/<backlight>/l2\\_office\\_max](/sys/class/backlight/<backlight>/l2_office_max)
- [/sys/class/backlight/<backlight>/l3\\_dark\\_max](/sys/class/backlight/<backlight>/l3_dark_max)
- [/sys/class/backlight/<backlight>/l1\\_daylight\\_dim](/sys/class/backlight/<backlight>/l1_daylight_dim)

- `/sys/class/backlight/<backlight>/l2_office_dim`
- `/sys/class/backlight/<backlight>/l3_dark_dim`

### 5.2.218 File testing/sysfs-class-backlight-driver-adp8870

See also `/sys/class/backlight/<backlight>/ambient_light_level` and `/sys/class/backlight/<backlight>/ambient_light_zone`.

Has the following ABI:

- `/sys/class/backlight/<backlight>/<ambient light zone>_max`
- `/sys/class/backlight/<backlight>/l1_daylight_max`
- `/sys/class/backlight/<backlight>/l2_bright_max`
- `/sys/class/backlight/<backlight>/l3_office_max`
- `/sys/class/backlight/<backlight>/l4_indoor_max`
- `/sys/class/backlight/<backlight>/l5_dark_max`
- `/sys/class/backlight/<backlight>/<ambient light zone>_dim`
- `/sys/class/backlight/<backlight>/l2_bright_dim`
- `/sys/class/backlight/<backlight>/l3_office_dim`
- `/sys/class/backlight/<backlight>/l4_indoor_dim`
- `/sys/class/backlight/<backlight>/l5_dark_dim`

### 5.2.219 File testing/sysfs-class-backlight-driver-lm3533

Has the following ABI:

- `/sys/class/backlight/<backlight>/als_channel`
- `/sys/class/backlight/<backlight>/als_en`
- `/sys/class/backlight/<backlight>/id`
- `/sys/class/backlight/<backlight>/linear`
- `/sys/class/backlight/<backlight>/pwm`

### 5.2.220 File testing/sysfs-class-backlight-lm3639

sysfs interface for Texas Instruments lm3639 backlight + flash led driver chip

Has the following ABI:

- `/sys/class/backlight/<backlight>/bled_mode`

### 5.2.221 File testing/sysfs-class-bdi

Has the following ABI:

- `/sys/class/bdi/<bdi>/`

### 5.2.222 File testing/sysfs-class-bsr

Has the following ABI:

- `/sys/class/bsr/bsr*/bsr_size`
- `/sys/class/bsr/bsr*/bsr_length`
- `/sys/class/bsr/bsr*/bsr_stride`

### 5.2.223 File testing/sysfs-class-chromeos

Has the following ABI:

- `/sys/class/chromeos/<ec-device-name>/flashinfo`
- `/sys/class/chromeos/<ec-device-name>/kb_wake_angle`
- `/sys/class/chromeos/<ec-device-name>/reboot`
- `/sys/class/chromeos/<ec-device-name>/version`

### 5.2.224 File testing/sysfs-class-chromeos-driver-cros-ec-lightbar

Has the following ABI:

- `/sys/class/chromeos/<ec-device-name>/lightbar/brightness`
- `/sys/class/chromeos/<ec-device-name>/lightbar/interval_msec`
- `/sys/class/chromeos/<ec-device-name>/lightbar/led_rgb`
- `/sys/class/chromeos/<ec-device-name>/lightbar/program`
- `/sys/class/chromeos/<ec-device-name>/lightbar/sequence`
- `/sys/class/chromeos/<ec-device-name>/lightbar/userspace_control`
- `/sys/class/chromeos/<ec-device-name>/lightbar/version`

### 5.2.225 File testing/sysfs-class-chromeos-driver-cros-ec-vbc

Has the following ABI:

- `/sys/class/chromeos/<ec-device-name>/vbc/vboot_context`

## 5.2.226 File testing/sysfs-class-cxl

Please note that attributes that are shared between devices are stored in the directory pointed to by the symlink device/. For example, the real path of the attribute /sys/class/cxl/afu0.0s/irqs\_max is /sys/class/cxl/afu0.0s/device/irqs\_max, i.e. /sys/class/cxl/afu0.0/irqs\_max.

Slave contexts (eg. /sys/class/cxl/afu0.0s):

Has the following ABI:

- `/sys/class/cxl/<afu>/afu_err_buf`
- `/sys/class/cxl/<afu>/irqs_max`
- `/sys/class/cxl/<afu>/irqs_min`
- `/sys/class/cxl/<afu>/mmio_size`
- `/sys/class/cxl/<afu>/modes_supported`
- `/sys/class/cxl/<afu>/mode`
- `/sys/class/cxl/<afu>/prefault_mode`
- `/sys/class/cxl/<afu>/reset`
- `/sys/class/cxl/<afu>/api_version`
- `/sys/class/cxl/<afu>/api_version_compatible`
- `/sys/class/cxl/<afu>/cr<config num>/vendor`
- `/sys/class/cxl/<afu>/cr<config num>/device`
- `/sys/class/cxl/<afu>/cr<config num>/class`
- `/sys/class/cxl/<afu>/cr<config num>/config`
- `/sys/class/cxl/<afu>m/mmio_size`
- `/sys/class/cxl/<afu>m/pp_mmio_len`
- `/sys/class/cxl/<afu>m/pp_mmio_off (not in a guest)`
- `/sys/class/cxl/<card>/caia_version`
- `/sys/class/cxl/<card>/psl_revision`
- `/sys/class/cxl/<card>/base_image (not in a guest)`
- `/sys/class/cxl/<card>/image_loaded (not in a guest)`
- `/sys/class/cxl/<card>/load_image_on_perst (not in a guest)`
- `/sys/class/cxl/<card>/reset`
- `/sys/class/cxl/<card>/perst_reloads_same_image (not in a guest)`
- `/sys/class/cxl/<card>/psl_timebase_synced`
- `/sys/class/cxl/<card>/tunneled_ops_supported`

### 5.2.227 File testing/sysfs-class-devfreq

Has the following ABI:

- */sys/class/devfreq/…/*
- */sys/class/devfreq/…/name*
- */sys/class/devfreq/…/governor*
- */sys/class/devfreq/…/cur\_freq*
- */sys/class/devfreq/…/target\_freq*
- */sys/class/devfreq/…/polling\_interval*
- */sys/class/devfreq/…/trans\_stat*
- */sys/class/devfreq/…/userspace/set\_freq*
- */sys/class/devfreq/…/available\_frequencies*
- */sys/class/devfreq/…/available\_governors*
- */sys/class/devfreq/…/min\_freq*
- */sys/class/devfreq/…/max\_freq*
- */sys/class/devfreq/…/timer*

### 5.2.228 File testing/sysfs-class-devfreq-event

Has the following ABI:

- */sys/class/devfreq-event/event(x)/*
- */sys/class/devfreq-event/event(x)/name*
- */sys/class/devfreq-event/event(x)/enable\_count*

### 5.2.229 File testing/sysfs-class-devlink

Has the following ABI:

- */sys/class/devlink/…/*
- */sys/class/devlink/…/auto\_remove\_on*
- */sys/class/devlink/…/consumer*
- */sys/class/devlink/…/runtime\_pm*
- */sys/class/devlink/…/status*
- */sys/class/devlink/…/supplier*
- */sys/class/devlink/…/sync\_state\_only*

### 5.2.230 File testing/sysfs-class-extcon

Has the following ABI:

- */sys/class/extcon/…/*
- */sys/class/extcon/…/name*
- */sys/class/extcon/…/state*
- */sys/class/extcon/…/cable.x/name*
- */sys/class/extcon/…/cable.x/state*
- */sys/class/extcon/…/mutually\_exclusive/..*

### 5.2.231 File testing/sysfs-class-fpga-bridge

Has the following ABI:

- */sys/class/fpga\_bridge/<bridge>/name*
- */sys/class/fpga\_bridge/<bridge>/state*

### 5.2.232 File testing/sysfs-class-fpga-manager

Has the following ABI:

- */sys/class/fpga\_manager/<fpga>/name*
- */sys/class/fpga\_manager/<fpga>/state*
- */sys/class/fpga\_manager/<fpga>/status*

### 5.2.233 File testing/sysfs-class-fpga-region

Has the following ABI:

- */sys/class/fpga\_region/<region>/compat\_id*

### 5.2.234 File testing/sysfs-class-gnss

Has the following ABI:

- */sys/class/gnss/gnssN/type*

### 5.2.235 File testing/sysfs-class-iommu

Has the following ABI:

- `/sys/class/iommu/<iommu>/devices/`
- `/sys/devices/…/iommu`

### 5.2.236 File testing/sysfs-class-iommu-amd-iommu

Has the following ABI:

- `/sys/class/iommu/<iommu>/amd-iommu/cap`
- `/sys/class/iommu/<iommu>/amd-iommu/features`

### 5.2.237 File testing/sysfs-class-iommu-intel-iommu

Has the following ABI:

- `/sys/class/iommu/<iommu>/intel-iommu/address`
- `/sys/class/iommu/<iommu>/intel-iommu/cap`
- `/sys/class/iommu/<iommu>/intel-iommu/ecap`
- `/sys/class/iommu/<iommu>/intel-iommu/version`

### 5.2.238 File testing/sysfs-class-lcd

Has the following ABI:

- `/sys/class/lcd/<lcd>/lcd_power`
- `/sys/class/lcd/<lcd>/contrast`
- `/sys/class/lcd/<lcd>/max_contrast`

### 5.2.239 File testing/sysfs-class-led

Has the following ABI:

- `/sys/class/leds/<led>/brightness`
- `/sys/class/leds/<led>/max_brightness`
- `/sys/class/leds/<led>/brightness_hw_changed`
- `/sys/class/leds/<led>/trigger`
- `/sys/class/leds/<led>/inverted`

## 5.2.240 File testing/sysfs-class-led-driver-el15203000

Has the following ABI:

- `/sys/class/leds/<led>/repeat`

## 5.2.241 File testing/sysfs-class-led-driver-lm3533

Has the following ABI:

- `/sys/class/leds/<led>/als_channel`
- `/sys/class/leds/<led>/als_en`
- `/sys/class/leds/<led>/falltime`
- `/sys/class/leds/<led>/risetime`
- `/sys/class/leds/<led>/id`
- `/sys/class/leds/<led>/linear`
- `/sys/class/leds/<led>/pwm`

## 5.2.242 File testing/sysfs-class-led-driver-turris-omnia

Has the following ABI:

- `/sys/class/leds/<led>/device/brightness`

## 5.2.243 File testing/sysfs-class-led-flash

Has the following ABI:

- `/sys/class/leds/<led>/flash_brightness`
- `/sys/class/leds/<led>/max_flash_brightness`
- `/sys/class/leds/<led>/flash_timeout`
- `/sys/class/leds/<led>/max_flash_timeout`
- `/sys/class/leds/<led>/flash_strobe`
- `/sys/class/leds/<led>/flash_fault`

## 5.2.244 File testing/sysfs-class-led-multicolor

Has the following ABI:

- `/sys/class/leds/<led>/multi_index`
- `/sys/class/leds/<led>/multi_intensity`

### 5.2.245 File testing/sysfs-class-led-trigger-netdev

Has the following ABI:

- `/sys/class/leds/<led>/device_name`
- `/sys/class/leds/<led>/interval`
- `/sys/class/leds/<led>/link`
- `/sys/class/leds/<led>/tx`
- `/sys/class/leds/<led>/rx`

### 5.2.246 File testing/sysfs-class-led-trigger-oneshot

Has the following ABI:

- `/sys/class/leds/<led>/delay_on`
- `/sys/class/leds/<led>/delay_off`
- `/sys/class/leds/<led>/invert`
- `/sys/class/leds/<led>/shot`

### 5.2.247 File testing/sysfs-class-led-trigger-pattern

Has the following ABI:

- `/sys/class/leds/<led>/pattern`
- `/sys/class/leds/<led>/hw_pattern`
- `/sys/class/leds/<led>/repeat`

### 5.2.248 File testing/sysfs-class-led-trigger-usbport

Has the following ABI:

- `/sys/class/leds/<led>/ports/<port>`

### 5.2.249 File testing/sysfs-class-leds-gt683r

Has the following ABI:

- `/sys/class/leds/<led>/gt683r mode`

### 5.2.250 File testing/sysfs-class-mei

Has the following ABI:

- */sys/class/mei/*
- */sys/class/mei/meiN/*
- */sys/class/mei/meiN/fw\_status*
- */sys/class/mei/meiN/hbm\_ver*
- */sys/class/mei/meiN/hbm\_ver\_drv*
- */sys/class/mei/meiN/tx\_queue\_limit*
- */sys/class/mei/meiN/fw\_ver*
- */sys/class/mei/meiN/dev\_state*
- */sys/class/mei/meiN/trc*
- */sys/class/mei/meiN/kind*

### 5.2.251 File testing/sysfs-class-mic

Has the following ABI:

- */sys/class/mic/*
- */sys/class/mic/mic(x)*
- */sys/class/mic/mic(x)/family*
- */sys/class/mic/mic(x)/stepping*
- */sys/class/mic/mic(x)/state*
- */sys/class/mic/mic(x)/shutdown\_status*
- */sys/class/mic/mic(x)/cmdline*
- */sys/class/mic/mic(x)/firmware*
- */sys/class/mic/mic(x)/ramdisk*
- */sys/class/mic/mic(x)/bootmode*
- */sys/class/mic/mic(x)/log\_buf\_addr*
- */sys/class/mic/mic(x)/log\_buf\_len*
- */sys/class/mic/mic(x)/heartbeat\_enable*

### 5.2.252 File testing/sysfs-class-mtd

Has the following ABI:

- */sys/class/mtd/*
- */sys/class/mtd/mtdX/*
- */sys/class/mtd/mtdXro/*
- */sys/class/mtd/mtdX/dev*
- */sys/class/mtd/mtdXro/dev*
- */sys/class/mtd/mtdX/erasesize*
- */sys/class/mtd/mtdX flags*
- */sys/class/mtd/mtdX/name*
- */sys/class/mtd/mtdX/numeraregions*
- */sys/class/mtd/mtdX/oobsize*
- */sys/class/mtd/mtdX/size*
- */sys/class/mtd/mtdX/type*
- */sys/class/mtd/mtdX/writesize*
- */sys/class/mtd/mtdX/ecc\_strength*
- */sys/class/mtd/mtdX/bitflip\_threshold*
- */sys/class/mtd/mtdX/ecc\_step\_size*
- */sys/class/mtd/mtdX/ecc\_failures*
- */sys/class/mtd/mtdX/corrected\_bits*
- */sys/class/mtd/mtdX/bad\_blocks*
- */sys/class/mtd/mtdX/bbt\_blocks*
- */sys/class/mtd/mtdX/offset*
- */sys/class/mtd/mtdX/oobavail*

### 5.2.253 File testing/sysfs-class-mux

Has the following ABI:

- */sys/class/mux/*
- */sys/class/mux/muxchipN/*

### 5.2.254 File testing/sysfs-class-net

Has the following ABI:

- `/sys/class/net/<iface>/name_assign_type`
- `/sys/class/net/<iface>/addr_assign_type`
- `/sys/class/net/<iface>/addr_len`
- `/sys/class/net/<iface>/address`
- `/sys/class/net/<bridge iface>/bridge/group_fwd_mask`
- `/sys/class/net/<iface>/broadcast`
- `/sys/class/net/<iface>/carrier`
- `/sys/class/net/<iface>/dev_id`
- `/sys/class/net/<iface>/dev_port`
- `/sys/class/net/<iface>/dormant`
- `/sys/class/net/<iface>/testing`
- `/sys/class/net/<iface>/duplex`
- `/sys/class/net/<iface>/flags`
- `/sys/class/net/<iface>/ifalias`
- `/sys/class/net/<iface>/ifindex`
- `/sys/class/net/<iface>/iflink`
- `/sys/class/net/<iface>/link_mode`
- `/sys/class/net/<iface>/mtu`
- `/sys/class/net/<iface>/netdev_group`
- `/sys/class/net/<iface>/operstate`
- `/sys/class/net/<iface>/phys_port_id`
- `/sys/class/net/<iface>/phys_port_name`
- `/sys/class/net/<iface>/speed`
- `/sys/class/net/<iface>/tx_queue_len`
- `/sys/class/net/<iface>/type`
- `/sys/class/net/<iface>/phys_switch_id`
- `/sys/class/net/<iface>/phydev`
- `/sys/class/net/<iface>/carrier_changes`
- `/sys/class/net/<iface>/carrier_up_count`
- `/sys/class/net/<iface>/carrier_down_count`

### 5.2.255 File testing/sysfs-class-net-cdc\_ncm

Has the following ABI:

- `/sys/class/net/<iface>/cdc_ncm/min_tx_pkt`
- `/sys/class/net/<iface>/cdc_ncm/ndp_to_end`
- `/sys/class/net/<iface>/cdc_ncm/rx_max`
- `/sys/class/net/<iface>/cdc_ncm/tx_max`
- `/sys/class/net/<iface>/cdc_ncm/tx_timer_usecs`
- `/sys/class/net/<iface>/cdc_ncm/bmNtbFormatsSupported`
- `/sys/class/net/<iface>/cdc_ncm/dwNtbInMaxSize`
- `/sys/class/net/<iface>/cdc_ncm/wNdpInDivisor`
- `/sys/class/net/<iface>/cdc_ncm/wNdpInPayloadRemainder`
- `/sys/class/net/<iface>/cdc_ncm/wNdpInAlignment`
- `/sys/class/net/<iface>/cdc_ncm/dwNtbOutMaxSize`
- `/sys/class/net/<iface>/cdc_ncm/wNdpOutDivisor`
- `/sys/class/net/<iface>/cdc_ncm/wNdpOutPayloadRemainder`
- `/sys/class/net/<iface>/cdc_ncm/wNdpOutAlignment`
- `/sys/class/net/<iface>/cdc_ncm/wNtbOutMaxDatagrams`

### 5.2.256 File testing/sysfs-class-net-dsa

Has the following ABI:

- `/sys/class/net/<iface>/dsa/tagging`

### 5.2.257 File testing/sysfs-class-net-grcan

Has the following ABI:

- `/sys/class/net/<iface>/grcan/enable0`
- `/sys/class/net/<iface>/grcan/enable1`
- `/sys/class/net/<iface>/grcan/select`

### 5.2.258 File testing/sysfs-class-net-janz-ican3

Has the following ABI:

- `/sys/class/net/<iface>/termination`
- `/sys/class/net/<iface>/fwinfo`

### 5.2.259 File testing/sysfs-class-net-phydev

Has the following ABI:

- `/sys/class/mdio_bus/<bus>/<device>/attached_dev`
- `/sys/class/mdio_bus/<bus>/<device>/phy_has_fixups`
- `/sys/class/mdio_bus/<bus>/<device>/phy_id`
- `/sys/class/mdio_bus/<bus>/<device>/phy_interface`
- `/sys/class/mdio_bus/<bus>/<device>/phy_standalone`

### 5.2.260 File testing/sysfs-class-net-qmi

Has the following ABI:

- `/sys/class/net/<iface>/qmi/raw_ip`
- `/sys/class/net/<iface>/qmi/add_mux`
- `/sys/class/net/<iface>/qmi/del_mux`

### 5.2.261 File testing/sysfs-class-net-queues

Has the following ABI:

- `/sys/class/net/<iface>/queues/rx-<queue>/rps_cpus`
- `/sys/class/net/<iface>/queues/rx-<queue>/rps_flow_cnt`
- `/sys/class/net/<iface>/queues/tx-<queue>/tx_timeout`
- `/sys/class/net/<iface>/queues/tx-<queue>/tx_maxrate`
- `/sys/class/net/<iface>/queues/tx-<queue>/xps_cpus`
- `/sys/class/net/<iface>/queues/tx-<queue>/xps_rxqs`
- `/sys/class/net/<iface>/queues/tx-<queue>/byte_queue_limits/hold_time`
- `/sys/class/net/<iface>/queues/tx-<queue>/byte_queue_limits/inflight`
- `/sys/class/net/<iface>/queues/tx-<queue>/byte_queue_limits/limit`
- `/sys/class/net/<iface>/queues/tx-<queue>/byte_queue_limits/limit_max`
- `/sys/class/net/<iface>/queues/tx-<queue>/byte_queue_limits/limit_min`

### 5.2.262 File testing/sysfs-class-net-statistics

Has the following ABI:

- `/sys/class/net/<iface>/statistics/collisions`
- `/sys/class/net/<iface>/statistics/multicast`
- `/sys/class/net/<iface>/statistics/rx_bytes`
- `/sys/class/net/<iface>/statistics/rx_compressed`
- `/sys/class/net/<iface>/statistics/rx_crc_errors`
- `/sys/class/net/<iface>/statistics/rx_dropped`
- `/sys/class/net/<iface>/statistics/rx_errors`
- `/sys/class/net/<iface>/statistics/rx_fifo_errors`
- `/sys/class/net/<iface>/statistics/rx_frame_errors`
- `/sys/class/net/<iface>/statistics/rx_length_errors`
- `/sys/class/net/<iface>/statistics/rx_missed_errors`
- `/sys/class/net/<iface>/statistics/rx_nohandler`
- `/sys/class/net/<iface>/statistics/rx_over_errors`
- `/sys/class/net/<iface>/statistics/rx_packets`
- `/sys/class/net/<iface>/statistics/tx_aborted_errors`
- `/sys/class/net/<iface>/statistics/tx_bytes`
- `/sys/class/net/<iface>/statistics/tx_carrier_errors`
- `/sys/class/net/<iface>/statistics/tx_compressed`
- `/sys/class/net/<iface>/statistics/tx_dropped`
- `/sys/class/net/<iface>/statistics/tx_errors`
- `/sys/class/net/<iface>/statistics/tx_fifo_errors`
- `/sys/class/net/<iface>/statistics/tx_heartbeat_errors`
- `/sys/class/net/<iface>/statistics/tx_packets`
- `/sys/class/net/<iface>/statistics/tx_window_errors`

### 5.2.263 File testing/sysfs-class-ocxl

Has the following ABI:

- `/sys/class/ocxl/<afu name>/afu_version`
- `/sys/class/ocxl/<afu name>/contexts`
- `/sys/class/ocxl/<afu name>/pp_mmio_size`
- `/sys/class/ocxl/<afu name>/global_mmio_size`
- `/sys/class/ocxl/<afu name>/global_mmio_area`

- */sys/class/ocxl/<afu name>/reload\_on\_reset*

## 5.2.264 File testing/sysfs-class-pktcdvd

sysfs interface

The pktcdvd module (packet writing driver) creates the following files in the sysfs: (<devid> is in the format major:minor)

Has the following ABI:

- */sys/class/pktcdvd/add*
- */sys/class/pktcdvd/remove*
- */sys/class/pktcdvd/device\_map*
- */sys/class/pktcdvd/pktcdvd[0-7]/dev*
- */sys/class/pktcdvd/pktcdvd[0-7]/uevent*
- */sys/class/pktcdvd/pktcdvd[0-7]/stat/packets\_started*
- */sys/class/pktcdvd/pktcdvd[0-7]/stat/packets\_finished*
- */sys/class/pktcdvd/pktcdvd[0-7]/stat/kb\_written*
- */sys/class/pktcdvd/pktcdvd[0-7]/stat/kb\_read*
- */sys/class/pktcdvd/pktcdvd[0-7]/stat/kb\_read\_gather*
- */sys/class/pktcdvd/pktcdvd[0-7]/stat/reset*
- */sys/class/pktcdvd/pktcdvd[0-7]/write\_queue/size*
- */sys/class/pktcdvd/pktcdvd[0-7]/write\_queue/congestion\_off*
- */sys/class/pktcdvd/pktcdvd[0-7]/write\_queue/congestion\_on*

## 5.2.265 File testing/sysfs-class-power

### General Properties

Has the following ABI:

- */sys/class/power\_supply/<supply\_name>/manufacturer*
- */sys/class/power\_supply/<supply\_name>/model\_name*
- */sys/class/power\_supply/<supply\_name>/serial\_number*
- */sys/class/power\_supply/<supply\_name>/type*
- */sys/class/power\_supply/<supply\_name>/current\_avg*
- */sys/class/power\_supply/<supply\_name>/current\_max*
- */sys/class/power\_supply/<supply\_name>/current\_now*
- */sys/class/power\_supply/<supply\_name>/temp*
- */sys/class/power\_supply/<supply\_name>/temp\_alert\_max*

- `/sys/class/power_supply/<supply_name>/temp_alert_min`
- `/sys/class/power_supply/<supply_name>/temp_max`
- `/sys/class/power_supply/<supply_name>/temp_min`
- `/sys/class/power_supply/<supply_name>/voltage_max`
- `/sys/class/power_supply/<supply_name>/voltage_min`
- `/sys/class/power_supply/<supply_name>/voltage_now`
- `/sys/class/power_supply/<supply_name>/capacity`
- `/sys/class/power_supply/<supply_name>/capacity_alert_max`
- `/sys/class/power_supply/<supply_name>/capacity_alert_min`
- `/sys/class/power_supply/<supply_name>/capacity_error_margin`
- `/sys/class/power_supply/<supply_name>/capacity_level`
- `/sys/class/power_supply/<supply_name>/charge_control_limit`
- `/sys/class/power_supply/<supply_name>/charge_control_limit_max`
- `/sys/class/power_supply/<supply_name>/charge_control_start_threshold`
- `/sys/class/power_supply/<supply_name>/charge_control_end_threshold`
- `/sys/class/power_supply/<supply_name>/charge_type`
- `/sys/class/power_supply/<supply_name>/charge_term_current`
- `/sys/class/power_supply/<supply_name>/health`
- `/sys/class/power_supply/<supply_name>/precharge_current`
- `/sys/class/power_supply/<supply_name>/present`
- `/sys/class/power_supply/<supply_name>/status`
- `/sys/class/power_supply/<supply_name>/technology`
- `/sys/class/power_supply/<supply_name>/voltage_avg`
- `/sys/class/power_supply/<supply_name>/input_current_limit`
- `/sys/class/power_supply/<supply_name>/input_voltage_limit`
- `/sys/class/power_supply/<supply_name>/input_power_limit`
- `/sys/class/power_supply/<supply_name>/online`
- `/sys/class/power_supply/<supply_name>/usb_type`
- `/sys/class/power/ds2760-battery.*/charge_now`
- `/sys/class/power/ds2760-battery.*/charge_full`
- `/sys/class/power_supply/max14577-charger/device/fast_charge_timer`
- `/sys/class/power_supply/max77693-charger/device/fast_charge_timer`
- `/sys/class/power_supply/max77693-charger/device/top_off_threshold_current`
- `/sys/class/power_supply/max77693-charger/device/top_off_timer`

- `/sys/class/power_supply/bq24257-charger/ovp_voltage`
- `/sys/class/power_supply/bq24257-charger/in_dpm_voltage`
- `/sys/class/power_supply/bq24257-charger/high_impedance_enable`
- `/sys/class/power_supply/bq24257-charger/sysoff_enable`
- `/sys/class/power_supply/<supply_name>/manufacture_year`
- `/sys/class/power_supply/<supply_name>/manufacture_month`
- `/sys/class/power_supply/<supply_name>/manufacture_day`

## 5.2.266 File testing/sysfs-class-power-mp2629

Has the following ABI:

- `/sys/class/power_supply/mp2629_battery/batt_impedance_compen`

## 5.2.267 File testing/sysfs-class-power-tw14030

Has the following ABI:

- `/sys/class/power_supply/tw14030_usb mode`
- `/sys/class/power_supply/tw14030_ac mode`

## 5.2.268 File testing/sysfs-class-power-wilco

Has the following ABI:

- `/sys/class/power_supply/wilco-charger/charge_type`
- `/sys/class/power_supply/wilco-charger/charge_control_start_threshold`
- `/sys/class/power_supply/wilco-charger/charge_control_end_threshold`

## 5.2.269 File testing/sysfs-class-powercap

Has the following ABI:

- `/sys/class/powercap/`
- `/sys/class/powercap/<control type>`
- `/sys/class/powercap/<control type>/enabled`
- `/sys/class/powercap/<control type>/<power zone>`
- `/sys/class/powercap/<control type>/<power zone>/<child power zone>`
- `/sys/class/powercap/…/<power zone>/name`
- `/sys/class/powercap/…/<power zone>/energy_uj`
- `/sys/class/powercap/…/<power zone>/max_energy_range_uj`
- `/sys/class/powercap/…/<power zone>/power_uw`

- `/sys/class/powercap/…/<power zone>/max_power_range_uw`
- `/sys/class/powercap/…/<power zone>/constraint_X_name`
- `/sys/class/powercap/…/<power zone>/constraint_X_power_limit_uw`
- `/sys/class/powercap/…/<power zone>/constraint_X_time_window_us`
- `/sys/class/powercap/<control type>/…/constraint_X_max_power_uw`
- `/sys/class/powercap/<control type>/…/constraint_X_min_power_uw`
- `/sys/class/powercap/…/<power zone>/constraint_X_max_time_window_us`
- `/sys/class/powercap/…/<power zone>/constraint_X_min_time_window_us`
- `/sys/class/powercap/…/<power zone>/enabled`

## 5.2.270 File testing/sysfs-class-pwm

Has the following ABI:

- `/sys/class/pwm/`
- `/sys/class/pwm/pwmchipN/`
- `/sys/class/pwm/pwmchipN/npwm`
- `/sys/class/pwm/pwmchipN/export`
- `/sys/class/pwm/pwmchipN/unexport`
- `/sys/class/pwm/pwmchipN/pwmX`
- `/sys/class/pwm/pwmchipN/pwmX/period`
- `/sys/class/pwm/pwmchipN/pwmX/duty_cycle`
- `/sys/class/pwm/pwmchipN/pwmX/polarity`
- `/sys/class/pwm/pwmchipN/pwmX/enable`
- `/sys/class/pwm/pwmchipN/pwmX/capture`

## 5.2.271 File testing/sysfs-class-rapidio

Has the following ABI:

- `/sys/class/rapidio_port`
- `/sys/class/rapidio_port/rapidioN/sys_size`
- `/sys/class/rapidio_port/rapidioN/port_destid`

### 5.2.272 File testing/sysfs-class-rc

Has the following ABI:

- */sys/class/rc/*
- */sys/class/rc/rcN/*
- */sys/class/rc/rcN/protocols*
- */sys/class/rc/rcN/filter*
- */sys/class/rc/rcN/filter\_mask*
- */sys/class/rc/rcN/wakeup\_protocols*
- */sys/class/rc/rcN/wakeup\_filter*
- */sys/class/rc/rcN/wakeup\_filter\_mask*

### 5.2.273 File testing/sysfs-class-rc-nuvoton

Has the following ABI:

- */sys/class/rc/rcN/wakeup\_data*

### 5.2.274 File testing/sysfs-class-regulator

Has the following ABI:

- */sys/class/regulator/…/state*
- */sys/class/regulator/…/status*
- */sys/class/regulator/…/type*
- */sys/class/regulator/…/microvolts*
- */sys/class/regulator/…/microamps*
- */sys/class/regulator/…/opmode*
- */sys/class/regulator/…/min\_microvolts*
- */sys/class/regulator/…/max\_microvolts*
- */sys/class/regulator/…/min\_microamps*
- */sys/class/regulator/…/max\_microamps*
- */sys/class/regulator/…/name*
- */sys/class/regulator/…/num\_users*
- */sys/class/regulator/…/requested\_microamps*
- */sys/class/regulator/…/parent*
- */sys/class/regulator/…/suspend\_mem\_microvolts*
- */sys/class/regulator/…/suspend\_disk\_microvolts*
- */sys/class/regulator/…/suspend\_standby\_microvolts*

- `/sys/class/regulator/…/suspend_mem_mode`
- `/sys/class/regulator/…/suspend_disk_mode`
- `/sys/class/regulator/…/suspend_standby_mode`
- `/sys/class/regulator/…/suspend_mem_state`
- `/sys/class/regulator/…/suspend_disk_state`
- `/sys/class/regulator/…/suspend_standby_state`
- `/sys/class/regulator/…/bypass`

### 5.2.275 File testing/sysfs-class-remoteproc

Has the following ABI:

- `/sys/class/remoteproc/…/firmware`
- `/sys/class/remoteproc/…/state`
- `/sys/class/remoteproc/…/name`
- `/sys/class/remoteproc/…/coredump`
- `/sys/class/remoteproc/…/recovery`

### 5.2.276 File testing/sysfs-class-rnbd-client

Has the following ABI:

- `/sys/class/rnbd-client`
- `/sys/class/rnbd-client/ctl/map_device`
- `/sys/class/rnbd-client/ctl/devices/`

### 5.2.277 File testing/sysfs-class-rnbd-server

Has the following ABI:

- `/sys/class/rnbd-server`
- `/sys/class/rnbd-server/ctl/`
- `/sys/class/rnbd-server/ctl/devices/<device_name>/block_dev`
- `/sys/class/rnbd-server/ctl/devices/<device_name>/sessions/`
- `/sys/class/rnbd-server/ctl/devices/<device_name>/sessions/<session-name>/read_only`
- `/sys/class/rnbd-server/ctl/devices/<device_name>/sessions/<session-name>/mapping_path`
- `/sys/class/rnbd-server/ctl/devices/<device_name>/sessions/<session-name>/access_mode`

### 5.2.278 File testing/sysfs-class-rtc

Has the following ABI:

- */sys/class/rtc/*
- */sys/class/rtc/rtcX/*
- */sys/class/rtc/rtcX/date*
- */sys/class/rtc/rtcX/hctosys*
- */sys/class/rtc/rtcX/max\_user\_freq*
- */sys/class/rtc/rtcX/name*
- */sys/class/rtc/rtcX/range*
- */sys/class/rtc/rtcX/since\_epoch*
- */sys/class/rtc/rtcX/time*
- */sys/class/rtc/rtcX/offset*
- */sys/class/rtc/rtcX/wakealarm*

### 5.2.279 File testing/sysfs-class-rtc-rtc0-device-rtc\_calibration

Has the following ABI:

- */sys/class/rtc/rtc0/device/rtc\_calibration*

### 5.2.280 File testing/sysfs-class-rtrs-client

Has the following ABI:

- */sys/class/rtrs-client*
- */sys/class/rtrs-client/<session-name>/add\_path*
- */sys/class/rtrs-client/<session-name>/max\_reconnect\_attempts*
- */sys/class/rtrs-client/<session-name>/mp\_policy*
- */sys/class/rtrs-client/<session-name>/paths/*
- */sys/class/rtrs-client/<session-name>/paths/<src@dst>/state*
- */sys/class/rtrs-client/<session-name>/paths/<src@dst>/reconnect*
- */sys/class/rtrs-client/<session-name>/paths/<src@dst>/disconnect*
- */sys/class/rtrs-client/<session-name>/paths/<src@dst>/remove\_path*
- */sys/class/rtrs-client/<session-name>/paths/<src@dst>/hca\_name*
- */sys/class/rtrs-client/<session-name>/paths/<src@dst>/hca\_port*
- */sys/class/rtrs-client/<session-name>/paths/<src@dst>/src\_addr*
- */sys/class/rtrs-client/<session-name>/paths/<src@dst>/dst\_addr*
- */sys/class/rtrs-client/<session-name>/paths/<src@dst>/stats/reset\_all*

- `/sys/class/rtrs-client/<session-name>/paths/<src@dst>/stats/cpu_migration`
- `/sys/class/rtrs-client/<session-name>/paths/<src@dst>/stats/reconnects`
- `/sys/class/rtrs-client/<session-name>/paths/<src@dst>/stats/rdma`

### 5.2.281 File testing/sysfs-class-rtrs-server

Has the following ABI:

- `/sys/class/rtrs-server`
- `/sys/class/rtrs-server/<session-name>/paths/`
- `/sys/class/rtrs-server/<session-name>/paths/<src@dst>/disconnect`
- `/sys/class/rtrs-server/<session-name>/paths/<src@dst>/hca_name`
- `/sys/class/rtrs-server/<session-name>/paths/<src@dst>/hca_port`
- `/sys/class/rtrs-server/<session-name>/paths/<src@dst>/src_addr`
- `/sys/class/rtrs-server/<session-name>/paths/<src@dst>/dst_addr`
- `/sys/class/rtrs-server/<session-name>/paths/<src@dst>/stats/rdma`

### 5.2.282 File testing/sysfs-class-scsi\_host

Has the following ABI:

- `/sys/class/scsi_host/hostX/isci_id`
- `/sys/class/scsi_host/hostX/accipath_status`
- `/sys/class/scsi_host/hostX/link_power_management_policy`
- `/sys/class/scsi_host/hostX/em_message`
- `/sys/class/scsi_host/hostX/em_message_type`
- `/sys/class/scsi_host/hostX/ahci_port_cmd`
- `/sys/class/scsi_host/hostX/ahci_host_caps`
- `/sys/class/scsi_host/hostX/ahci_host_cap2`
- `/sys/class/scsi_host/hostX/ahci_host_version`
- `/sys/class/scsi_host/hostX/em_buffer`
- `/sys/class/scsi_host/hostX/em_message_supported`

### 5.2.283 File testing/sysfs-class-scsi\_tape

Has the following ABI:

- */sys/class/scsi\_tape/\*/stats/in\_flight*
- */sys/class/scsi\_tape/\*/stats/io\_ns*
- */sys/class/scsi\_tape/\*/stats/other\_cnt*
- */sys/class/scsi\_tape/\*/stats/read\_byte\_cnt*
- */sys/class/scsi\_tape/\*/stats/read\_cnt*
- */sys/class/scsi\_tape/\*/stats/read\_ns*
- */sys/class/scsi\_tape/\*/stats/write\_byte\_cnt*
- */sys/class/scsi\_tape/\*/stats/write\_cnt*
- */sys/class/scsi\_tape/\*/stats/write\_ms*
- */sys/class/scsi\_tape/\*/stats/resid\_cnt*

### 5.2.284 File testing/sysfs-class-stm

Has the following ABI:

- */sys/class/stm/<stm>/masters*
- */sys/class/stm/<stm>/channels*
- */sys/class/stm/<stm>/hw\_override*

### 5.2.285 File testing/sysfs-class-stm\_source

Has the following ABI:

- */sys/class/stm\_source/<stm\_source>/stm\_source\_link*

### 5.2.286 File testing/sysfs-class-switchtec

switchtec - Microsemi Switchtec PCI Switch Management Endpoint

For details on this subsystem look at /driver-api/switchtec.

Has the following ABI:

- */sys/class/switchtec*
- */sys/class/switchtec/switchtec[0-9]+/component\_id*
- */sys/class/switchtec/switchtec[0-9]+/component\_revision*
- */sys/class/switchtec/switchtec[0-9]+/component\_vendor*
- */sys/class/switchtec/switchtec[0-9]+/device\_version*
- */sys/class/switchtec/switchtec[0-9]+/fw\_version*
- */sys/class/switchtec/switchtec[0-9]+/partition*

- `/sys/class/switchtec/switchtec[0-9]+/partition_count`
- `/sys/class/switchtec/switchtec[0-9]+/product_id`
- `/sys/class/switchtec/switchtec[0-9]+/product_revision`
- `/sys/class/switchtec/switchtec[0-9]+/product_vendor`

## 5.2.287 File testing/sysfs-class-typec

USB Type-C port devices (eg. `/sys/class/typec/port0/`)

Has the following ABI:

- `/sys/class/typec/<port>/data_role`
- `/sys/class/typec/<port>/power_role`
- `/sys/class/typec/<port>/port_type`
- `/sys/class/typec/<port>/vconn_source`
- `/sys/class/typec/<port>/power_operation_mode`
- `/sys/class/typec/<port>/preferred_role`
- `/sys/class/typec/<port>/supported_accessory_modes`
- `/sys/class/typec/<port>/usb_power_delivery_revision`
- `/sys/class/typec/<port>/usb_typec_revision`
- `/sys/class/typec/<port>/orientation`
- `/sys/class/typec/<port>-partner/accessory_mode`
- `/sys/class/typec/<port>-partner/supports_usb_power_delivery`
- `/sys/class/typec/<port>-partner/identity/`
- `/sys/class/typec/<port>-partner/identity/id_header`
- `/sys/class/typec/<port>-partner/identity/cert_stat`
- `/sys/class/typec/<port>-partner/identity/product`
- `/sys/class/typec/<port>-cable/type`
- `/sys/class/typec/<port>-cable/plug_type`
- `/sys/class/typec/<port>-cable/identity/`
- `/sys/class/typec/<port>-cable/identity/id_header`
- `/sys/class/typec/<port>-cable/identity/cert_stat`
- `/sys/class/typec/<port>-cable/identity/product`
- `/sys/class/typec/<port>/<alt mode>/supported_roles`

### 5.2.288 File testing/sysfs-class-usb\_role

Has the following ABI:

- `/sys/class/usb_role/`
- `/sys/class/usb_role/<switch>/role`

### 5.2.289 File testing/sysfs-class-uwb\_rc

Has the following ABI:

- `/sys/class/uwb_rc`
- `/sys/class/uwb_rc/beacon_timeout_ms`
- `/sys/class/uwb_rc/uwbN/`
- `/sys/class/uwb_rc/uwbN/beacon`
- `/sys/class/uwb_rc/uwbN/ASIE`
- `/sys/class/uwb_rc/uwbN/scan`
- `/sys/class/uwb_rc/uwbN/mac_address`
- `/sys/class/uwb_rc/uwbN/wusbhc`
- `/sys/class/uwb_rc/uwbN/<EUI-48>/`
- `/sys/class/uwb_rc/uwbN/<EUI-48>/BPST`
- `/sys/class/uwb_rc/uwbN/<EUI-48>/DevAddr`
- `/sys/class/uwb_rc/uwbN/<EUI-48>/EUI_48`
- `/sys/class/uwb_rc/uwbN/<EUI-48>/IEs`
- `/sys/class/uwb_rc/uwbN/<EUI-48>/LQE`
- `/sys/class/uwb_rc/uwbN/<EUI-48>/RSSI`

### 5.2.290 File testing/sysfs-class-uwb\_rc-wusbhc

Has the following ABI:

- `/sys/class/uwb_rc/uwbN/wusbhc/wusb_chid`
- `/sys/class/uwb_rc/uwbN/wusbhc/wusb_trust_timeout`
- `/sys/class/uwb_rc/uwbN/wusbhc/wusb_phy_rate`
- `/sys/class/uwb_rc/uwbN/wusbhc/wusb_dnts`
- `/sys/class/uwb_rc/uwbN/wusbhc/wusb_retry_count`

## 5.2.291 File testing/sysfs-class-wakeup

Has the following ABI:

- `/sys/class/wakeup/`
- `/sys/class/wakeup/…/name`
- `/sys/class/wakeup/…/active_count`
- `/sys/class/wakeup/…/event_count`
- `/sys/class/wakeup/…/wakeup_count`
- `/sys/class/wakeup/…/expire_count`
- `/sys/class/wakeup/…/active_time_ms`
- `/sys/class/wakeup/…/total_time_ms`
- `/sys/class/wakeup/…/max_time_ms`
- `/sys/class/wakeup/…/last_change_ms`
- `/sys/class/wakeup/…/prevent_suspend_time_ms`

## 5.2.292 File testing/sysfs-class-watchdog

Has the following ABI:

- `/sys/class/watchdog/watchdogn/bootstatus`
- `/sys/class/watchdog/watchdogn/identity`
- `/sys/class/watchdog/watchdogn/nokayout`
- `/sys/class/watchdog/watchdogn/state`
- `/sys/class/watchdog/watchdogn/status`
- `/sys/class/watchdog/watchdogn/timelleft`
- `/sys/class/watchdog/watchdogn/timeout`
- `/sys/class/watchdog/watchdogn/pretimeout`
- `/sys/class/watchdog/watchdogn/pretimeout_avaialable_governors`
- `/sys/class/watchdog/watchdogn/pretimeout_governor`
- `/sys/class/watchdog/watchdog1/access_cs0`

### 5.2.293 File testing/sysfs-class-zram

Has the following ABI:

- `/sys/class/zram-control/`
- `/sys/class/zram-control/hot_add`
- `/sys/class/zram-control/hot_remove`

### 5.2.294 File testing/sysfs-dev

Has the following ABI:

- `/sys/dev`

### 5.2.295 File testing/sysfs-devices

Has the following ABI:

- `/sys/devices`

### 5.2.296 File testing/sysfs-devices-consumer

Has the following ABI:

- `/sys/devices/…/consumer:<consumer>`

### 5.2.297 File testing/sysfs-devices-coredump

Has the following ABI:

- `/sys/devices/…/coredump`

### 5.2.298 File testing/sysfs-devices-edac

Has the following ABI:

- `/sys/devices/system/edac/mc/mc*/reset_counters`
- `/sys/devices/system/edac/mc/mc*/seconds_since_reset`
- `/sys/devices/system/edac/mc/mc*/mc_name`
- `/sys/devices/system/edac/mc/mc*/size_mb`
- `/sys/devices/system/edac/mc/mc*/ue_count`
- `/sys/devices/system/edac/mc/mc*/ue_noinfo_count`
- `/sys/devices/system/edac/mc/mc*/ce_count`
- `/sys/devices/system/edac/mc/mc*/ce_noinfo_count`
- `/sys/devices/system/edac/mc/mc*/sdram_scrub_rate`

- */sys/devices/system/edac/mc/mc\*/max\_location*
- */sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/size*
- */sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_dev\_type*

- */sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_ce\_count*
- */sys/devices/system/edac/mc/mc\*/(dimm|rank)\*/dimm\_ue\_count*

### **5.2.299 File testing/sysfs-devices-firmware\_node**

Has the following ABI:

- */sys/devices/…/firmware\_node/*
- */sys/devices/…/firmware\_node/description*

### **5.2.300 File testing/sysfs-devices-lpss\_ltr**

Has the following ABI:

- */sys/devices/…/lpss\_ltr/*
- */sys/devices/…/lpss\_ltr/ltr\_mode*
- */sys/devices/…/lpss\_ltr/auto\_ltr*
- */sys/devices/…/lpss\_ltr/sw\_ltr*

### **5.2.301 File testing/sysfs-devices-mapping**

Has the following ABI:

- */sys/devices/uncore\_iio\_x/dieX*

### **5.2.302 File testing/sysfs-devices-memory**

Has the following ABI:

- */sys/devices/system/memory*
- */sys/devices/system/memory/memoryX/removable*
- */sys/devices/system/memory/memoryX/phys\_device*
- */sys/devices/system/memory/memoryX/phys\_index*
- */sys/devices/system/memory/memoryX/state*
- */sys/devices/system/memory/memoryX/valid\_zones*

- */sys/devices/system/memoryX/nodeY*
- */sys/devices/system/node/nodeX/memoryY*

### **5.2.303 File testing/sysfs-devices-mmc**

Has the following ABI:

- */sys/devices/…/mmc\_host/mmcX/mmcX:XXXX/enhanced\_area\_offset*
- */sys/devices/…/mmc\_host/mmcX/mmcX:XXXX/enhanced\_area\_size*

### **5.2.304 File testing/sysfs-devices-online**

Has the following ABI:

- */sys/devices/…/online*

### **5.2.305 File testing/sysfs-devices-platform-ACPI-TAD**

ACPI Time and Alarm (TAD) device attributes.

Has the following ABI:

- */sys/bus/platform/devices/ACPI000E:00/caps*
- */sys/bus/platform/devices/ACPI000E:00/ac\_alarm*
- */sys/bus/platform/devices/ACPI000E:00/ac\_policy*
- */sys/bus/platform/devices/ACPI000E:00/ac\_status*
- */sys/bus/platform/devices/ACPI000E:00/dc\_alarm*
- */sys/bus/platform/devices/ACPI000E:00/dc\_policy*
- */sys/bus/platform/devices/ACPI000E:00/dc\_status*

### **5.2.306 File testing/sysfs-devices-platform-\_UDC\_-gadget**

Has the following ABI:

- */sys/devices/platform/\_UDC\_/gadget/suspended*
- */sys/devices/platform/\_UDC\_/gadget/gadget-lunX/nofua*

### 5.2.307 File testing/sysfs-devices-platform-docg3

Has the following ABI:

- */sys/devices/platform/docg3/f[0-3]\_dps[01]\_is\_keylocked*
- */sys/devices/platform/docg3/f[0-3]\_dps[01]\_protection\_key*

### 5.2.308 File testing/sysfs-devices-platform-dock

Has the following ABI:

- */sys/devices/platform/dock.N/docked*
- */sys/devices/platform/dock.N/undock*
- */sys/devices/platform/dock.N/uid*
- */sys/devices/platform/dock.N flags*
- */sys/devices/platform/dock.N/type*

### 5.2.309 File testing/sysfs-devices-platform-ipmi

Has the following ABI:

- */sys/devices/platform/ipmi\_bmc.\*/firmware\_revision*
- */sys/devices/platform/ipmi\_bmc.\*/aux\_firmware\_revision*
- */sys/devices/platform/ipmi\_bmc.\*/revision*
- */sys/devices/platform/ipmi\_bmc.\*/provides\_device\_sdrs*
- */sys/devices/platform/ipmi\_bmc.\*/device\_id*
- */sys/devices/platform/ipmi\_bmc.\*/additional\_device\_support*
- */sys/devices/platform/ipmi\_bmc.\*/ipmi\_version*
- */sys/devices/platform/ipmi\_bmc.\*/manufacturer\_id*
- */sys/devices/platform/ipmi\_bmc.\*/product\_id*
- */sys/devices/platform/ipmi\_bmc.\*/guid*
- */sys/devices/platform/ipmi\_si.\*/type*
- */sys/devices/platform/ipmi\_si.\*/idles*
- */sys/devices/platform/ipmi\_si.\*/watchdog\_pretimeouts*
- */sys/devices/platform/ipmi\_si.\*/complete\_transactions*
- */sys/devices/platform/ipmi\_si.\*/events*
- */sys/devices/platform/ipmi\_si.\*/interrupts*
- */sys/devices/platform/ipmi\_si.\*/hosed\_count*
- */sys/devices/platform/ipmi\_si.\*/long\_timeouts*
- */sys/devices/platform/ipmi\_si.\*/flag\_fetches*

- */sys/devices/platform/ipmi\_si.\*/attentions*
- */sys/devices/platform/ipmi\_si.\*/incoming\_messages*
- */sys/devices/platform/ipmi\_si.\*/short\_timeouts*
- */sys/devices/platform/ipmi\_si.\*/interrupts\_enabled*
- */sys/devices/platform/ipmi\_si.\*/params*
- */sys/devices/platform/dmi-ipmi-ssif.\*/type*
- */sys/devices/platform/dmi-ipmi-ssif.\*/hosed*
- */sys/devices/platform/dmi-ipmi-ssif.\*/alerts*
- */sys/devices/platform/dmi-ipmi-ssif.\*/sent\_messages*
- */sys/devices/platform/dmi-ipmi-ssif.\*/sent\_messages\_parts*
- */sys/devices/platform/dmi-ipmi-ssif.\*/received\_messages*
- */sys/devices/platform/dmi-ipmi-ssif.\*/received\_message\_parts*
- */sys/devices/platform/dmi-ipmi-ssif.\*/events*
- */sys/devices/platform/dmi-ipmi-ssif.\*/watchdog\_pretimeouts*
- */sys/devices/platform/dmi-ipmi-ssif.\*/flag\_fetches*
- */sys/devices/platform/dmi-ipmi-ssif.\*/send\_retries*
- */sys/devices/platform/dmi-ipmi-ssif.\*/receive\_retries*
- */sys/devices/platform/dmi-ipmi-ssif.\*/send\_errors*
- */sys/devices/platform/dmi-ipmi-ssif.\*/receive\_errors*

### **5.2.310 File testing/sysfs-devices-platform-sh\_mobile\_lcdc\_fb**

Has the following ABI:

- */sys/devices/platform/sh\_mobile\_lcdc\_fb.[0-3]/graphics/fb[0-9]/ovl\_alpha*
- */sys/devices/platform/sh\_mobile\_lcdc\_fb.[0-3]/graphics/fb[0-9]/ovl\_mode*
- */sys/devices/platform/sh\_mobile\_lcdc\_fb.[0-3]/graphics/fb[0-9]/ovl\_position*
- */sys/devices/platform/sh\_mobile\_lcdc\_fb.[0-3]/graphics/fb[0-9]/ovl\_rop3*

### **5.2.311 File testing/sysfs-devices-platform-stratix10-rsu**

Intel Stratix10 Remote System Update (RSU) device attributes

Has the following ABI:

- */sys/devices/platform/stratix10-rsu.0/current\_image*
- */sys/devices/platform/stratix10-rsu.0/fail\_image*
- */sys/devices/platform/stratix10-rsu.0/state*
- */sys/devices/platform/stratix10-rsu.0/version*

- */sys/devices/platform/stratix10-rsu.0/error\_location*
- */sys/devices/platform/stratix10-rsu.0/error\_details*
- */sys/devices/platform/stratix10-rsu.0/retry\_counter*
- */sys/devices/platform/stratix10-rsu.0/reboot\_image*
- */sys/devices/platform/stratix10-rsu.0/notify*
- */sys/devices/platform/stratix10-rsu.0/dcmf0*
- */sys/devices/platform/stratix10-rsu.0/dcmf1*
- */sys/devices/platform/stratix10-rsu.0/dcmf2*
- */sys/devices/platform/stratix10-rsu.0/dcmf3*
- */sys/devices/platform/stratix10-rsu.0/max\_retry*

### 5.2.312 File testing/sysfs-devices-platform-trackpoint

Has the following ABI:

- */sys/devices/platform/i8042/…/sensitivity*
- */sys/devices/platform/i8042/…/intertia*
- */sys/devices/platform/i8042/…/reach*
- */sys/devices/platform/i8042/…/draghys*
- */sys/devices/platform/i8042/…/mindrag*
- */sys/devices/platform/i8042/…/speed*
- */sys/devices/platform/i8042/…/thresh*
- */sys/devices/platform/i8042/…/upthresh*
- */sys/devices/platform/i8042/…/ztime*
- */sys/devices/platform/i8042/…/jenks*
- */sys/devices/platform/i8042/…/skipback*
- */sys/devices/platform/i8042/…/ext\_dev*
- */sys/devices/platform/i8042/…/press\_to\_select*
- */sys/devices/platform/i8042/…/drift\_time*

### 5.2.313 File testing/sysfs-devices-power

Has the following ABI:

- */sys/devices/…/power/*
- */sys/devices/…/power/wakeup*
- */sys/devices/…/power/control*
- */sys/devices/…/power/async*

- */sys/devices/…/power/wakeup\_count*
- */sys/devices/…/power/wakeup\_active\_count*
- */sys/devices/…/power/wakeup\_abort\_count*
- */sys/devices/…/power/wakeup\_expire\_count*
- */sys/devices/…/power/wakeup\_active*
- */sys/devices/…/power/wakeup\_total\_time\_ms*
- */sys/devices/…/power/wakeup\_max\_time\_ms*
- */sys/devices/…/power/wakeup\_last\_time\_ms*
- */sys/devices/…/power/wakeup\_prevent\_sleep\_time\_ms*
- */sys/devices/…/power/autosuspend\_delay\_ms*
- */sys/devices/…/power/pm\_qos\_resume\_latency\_us*
- */sys/devices/…/power/pm\_qos\_latency\_tolerance\_us*
- */sys/devices/…/power/pm\_qos\_no\_power\_off*
- */sys/devices/…/power/runtime\_status*

### 5.2.314 File testing/sysfs-devices-power\_resources\_D0

Has the following ABI:

- */sys/devices/…/power\_resources\_D0/*

### 5.2.315 File testing/sysfs-devices-power\_resources\_D1

Has the following ABI:

- */sys/devices/…/power\_resources\_D1/*

### 5.2.316 File testing/sysfs-devices-power\_resources\_D2

Has the following ABI:

- */sys/devices/…/power\_resources\_D2/*

### 5.2.317 File testing/sysfs-devices-power\_resources\_D3hot

Has the following ABI:

- */sys/devices/…/power\_resources\_D3hot/*

### 5.2.318 File testing/sysfs-devices-power\_resources\_wakeup

Has the following ABI:

- */sys/devices/…/power\_resources\_wakeup/*

### 5.2.319 File testing/sysfs-devices-power\_state

Has the following ABI:

- */sys/devices/…/power\_state*

### 5.2.320 File testing/sysfs-devices-real\_power\_state

Has the following ABI:

- */sys/devices/…/real\_power\_state*

### 5.2.321 File testing/sysfs-devices-removable

Has the following ABI:

- */sys/devices/…/removable*

### 5.2.322 File testing/sysfs-devices-resource\_in\_use

Has the following ABI:

- */sys/devices/…/resource\_in\_use*

### 5.2.323 File testing/sysfs-devices-soc

Has the following ABI:

- */sys/devices/socX*
- */sys/devices/socX/machine*
- */sys/devices/socX/family*
- */sys/devices/socX/serial\_number*
- */sys/devices/socX/soc\_id*
- */sys/devices/socX/revision*
- */sys/devices/socX/process*
- */sys/bus/soc*

### 5.2.324 File testing/sysfs-devices-software\_node

Has the following ABI:

- */sys/devices/…/software\_node/*

### 5.2.325 File testing/sysfs-devices-state\_synced

Has the following ABI:

- */sys/devices/…/state\_synced*

### 5.2.326 File testing/sysfs-devices-sun

Has the following ABI:

- */sys/devices/…/sun*

### 5.2.327 File testing/sysfs-devices-supplier

Has the following ABI:

- */sys/devices/…/supplier:<supplier>*

### 5.2.328 File testing/sysfs-devices-system-cpu

Has the following ABI:

- */sys/devices/system/cpu/*
- */sys/devices/system/cpu/kernel\_max*
- */sys/devices/system/cpu/probe*
- */sys/devices/system/cpu/cpu#/node*
- */sys/devices/system/cpu/cpu#/topology/core\_id*
- */sys/devices/system/cpu/cpuidle/available\_governors*
- */sys/devices/system/cpu/cpuX/cpuidle/stateN/name*
- */sys/devices/system/cpu/cpuX/cpuidle/stateN/desc*
- */sys/devices/system/cpu/cpuX/cpuidle/stateN/disable*
- */sys/devices/system/cpu/cpuX/cpuidle/stateN/default\_status*
- */sys/devices/system/cpu/cpuX/cpuidle/stateN/residency*
- */sys/devices/system/cpu/cpuX/cpuidle/stateN/s2idle/*
- */sys/devices/system/cpu/cpuX/cpuidle/stateN/s2idle/time*
- */sys/devices/system/cpu/cpuX/cpuidle/stateN/s2idle/usage*
- */sys/devices/system/cpu/cpu#/cpufreq/\**
- */sys/devices/system/cpu/cpu#/cpufreq/freqdomain\_cpus*

- */sys/devices/system/cpu/cpu\*/cache/index3/cache\_disable\_{0,1}*
- */sys/devices/system/cpu/cpufreq/boost*
- */sys/devices/system/cpu/cpu#/crash\_notes*
- */sys/devices/system/cpu/intel\_pstate/max\_perf\_pct*
- */sys/devices/system/cpu/cpu\*/cache/index\*/<set\_of\_attributes\_mentioned\_below>*
- */sys/devices/system/cpu/cpu\*/cache/index\*/id*
- */sys/devices/system/cpu/cpuX/cpufreq/throttle\_stats*
- */sys/devices/system/cpu/cpufreq/policyX/throttle\_stats*
- */sys/devices/system/cpu/cpuX/regs/*
- */sys/devices/system/cpu/cpu#/cpu\_capacity*
- */sys/devices/system/cpu/vulnerabilities*
- */sys/devices/system/cpu/smt*
- */sys/devices/system/cpu/cpu#/power/energy\_perf\_bias*
- */sys/devices/system/cpu/umwait\_control*
- */sys/devices/system/cpu/svm*
- */sys/devices/system/cpu/cpuX/purr*
- */sys/devices/system/cpu/cpuX/spurr*
- */sys/devices/system/cpu/cpuX/idle\_purr*
- */sys/devices/system/cpu/cpuX/idle\_spurr*

### 5.2.329 File testing/sysfs-devices-system-ibm-rtl

Has the following ABI:

- */sys/devices/system/ibm rtl/state*
- */sys/devices/system/ibm rtl/version*

### 5.2.330 File testing/sysfs-devices-system-xen\_cpu

Has the following ABI:

- */sys/devices/system/xen\_cpu/*
- */sys/devices/system/xen\_cpu/xen\_cpu#/online*

### 5.2.331 File testing/sysfs-devices-waiting\_for\_supplier

Has the following ABI:

- */sys/devices/…/waiting\_for\_supplier*

### 5.2.332 File testing/sysfs-driver-altera-cvp

Has the following ABI:

- */sys/bus/pci/drivers/altera-cvp/chkcfg*

### 5.2.333 File testing/sysfs-driver-bd9571mwv-regulator

Has the following ABI:

- */sys/bus/i2c/devices/…/bd9571mwv-regulator\*.auto/backup\_mode*

### 5.2.334 File testing/sysfs-driver-fsi-master-gpio

Has the following ABI:

- */sys/bus/platform/devices/[..]/fsi-master-gpio/external\_mode*

### 5.2.335 File testing/sysfs-driver-genwqe

Has the following ABI:

- */sys/class/genwqe/genwqe<n>\_card/version*
- */sys/class/genwqe/genwqe<n>\_card/appid*
- */sys/class/genwqe/genwqe<n>\_card/type*
- */sys/class/genwqe/genwqe<n>\_card/curr\_bitstream*
- */sys/class/genwqe/genwqe<n>\_card/next\_bitstream*
- */sys/class/genwqe/genwqe<n>\_card/reload\_bitstream*
- */sys/class/genwqe/genwqe<n>\_card/temp sens*
- */sys/class/genwqe/genwqe<n>\_card/freerunning\_timer*
- */sys/class/genwqe/genwqe<n>\_card/queue\_working\_time*
- */sys/class/genwqe/genwqe<n>\_card/state*
- */sys/class/genwqe/genwqe<n>\_card/base\_clock*
- */sys/class/genwqe/genwqe<n>\_card/device/sriov\_numvfs*

### 5.2.336 File testing/sysfs-driver-habanalabs

Has the following ABI:

- `/sys/class/habanalabs/hl<n>/armcp_kernel_ver`
- `/sys/class/habanalabs/hl<n>/armcp_ver`
- `/sys/class/habanalabs/hl<n>/clk_max_freq_mhz`
- `/sys/class/habanalabs/hl<n>/clk_cur_freq_mhz`
- `/sys/class/habanalabs/hl<n>/cpld_ver`
- `/sys/class/habanalabs/hl<n>/cpucp_kernel_ver`
- `/sys/class/habanalabs/hl<n>/cpucp_ver`
- `/sys/class/habanalabs/hl<n>/device_type`
- `/sys/class/habanalabs/hl<n>/eeprom`
- `/sys/class/habanalabs/hl<n>/fuse_ver`
- `/sys/class/habanalabs/hl<n>/hard_reset`
- `/sys/class/habanalabs/hl<n>/hard_reset_cnt`
- `/sys/class/habanalabs/hl<n>/high_pll`
- `/sys/class/habanalabs/hl<n>/ic_clk`
- `/sys/class/habanalabs/hl<n>/ic_clk_curr`
- `/sys/class/habanalabs/hl<n>/infineon_ver`
- `/sys/class/habanalabs/hl<n>/max_power`
- `/sys/class/habanalabs/hl<n>/mme_clk`
- `/sys/class/habanalabs/hl<n>/mme_clk_curr`
- `/sys/class/habanalabs/hl<n>/pci_addr`
- `/sys/class/habanalabs/hl<n>/pm_mng_profile`
- `/sys/class/habanalabs/hl<n>/preboot_btl_ver`
- `/sys/class/habanalabs/hl<n>/soft_reset`
- `/sys/class/habanalabs/hl<n>/soft_reset_cnt`
- `/sys/class/habanalabs/hl<n>/status`
- `/sys/class/habanalabs/hl<n>/thermal_ver`
- `/sys/class/habanalabs/hl<n>/tpc_clk`
- `/sys/class/habanalabs/hl<n>/tpc_clk_curr`
- `/sys/class/habanalabs/hl<n>/uboot_ver`

### 5.2.337 File testing/sysfs-driver-hid

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/report_descriptor`
- `/sys/class/bluetooth/hci<addr>/<hid-bus>:<vendor-id>:<product-id>.<num>/report_descriptor`
- `/sys/class/hidraw/hidraw<num>/device/report_descriptor`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/country`
- `/sys/class/bluetooth/hci<addr>/<hid-bus>:<vendor-id>:<product-id>.<num>/country`
- `/sys/class/hidraw/hidraw<num>/device/country`

### 5.2.338 File testing/sysfs-driver-hid-corsair

Has the following ABI:

- `/sys/bus/drivers/corsair/<dev>/macro_mode`
- `/sys/bus/drivers/corsair/<dev>/current_profile`

### 5.2.339 File testing/sysfs-driver-hid-lenovo

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/press_to_select`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/dragging`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/release_to_select`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/select_right`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/sensitivity`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/press_speed`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/fn_lock`

### 5.2.340 File testing/sysfs-driver-hid-logitech-hidpp

Has the following ABI:

- `/sys/bus/hid/drivers/logitech-hidpp-device/<dev>/range`
- `/sys/bus/hid/drivers/logitech-hidpp-device/<dev>/builtin_power_supply`

### 5.2.341 File testing/sysfs-driver-hid-logitech-lg4ff

Has the following ABI:

- `/sys/bus/hid/drivers/logitech/<dev>/range`
- `/sys/bus/hid/drivers/logitech/<dev>/alternate_modes`
- `/sys/bus/hid/drivers/logitech/<dev>/real_id`
- `/sys/bus/hid/drivers/logitech/<dev>/combine_pedals`

### 5.2.342 File testing/sysfs-driver-hid-multitouch

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/quirks`

### 5.2.343 File testing/sysfs-driver-hid-ntrig

Has the following ABI:

- `/sys/bus/hid/drivers/ntrig/<dev>/activate_slack`
- `/sys/bus/hid/drivers/ntrig/<dev>/deactivate_slack`
- `/sys/bus/hid/drivers/ntrig/<dev>/activation_width`
- `/sys/bus/hid/drivers/ntrig/<dev>/activation_height`
- `/sys/bus/hid/drivers/ntrig/<dev>/min_width`
- `/sys/bus/hid/drivers/ntrig/<dev>/min_height`
- `/sys/bus/hid/drivers/ntrig/<dev>/sensor_physical_width`
- `/sys/bus/hid/drivers/ntrig/<dev>/sensor_physical_height`
- `/sys/bus/hid/drivers/ntrig/<dev>/sensor_logical_width`
- `/sys/bus/hid/drivers/ntrig/<dev>/sensor_logical_height`

### 5.2.344 File testing/sysfs-driver-hid-picolcd

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/operation_mode`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/operation_mode_delay`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/fb_update_rate`

### 5.2.345 File testing/sysfs-driver-hid-prodikeys

Has the following ABI:

- `/sys/bus/hid/drivers/prodikeys/…/channel`
- `/sys/bus/hid/drivers/prodikeys/…/sustain`
- `/sys/bus/hid/drivers/prodikeys/…/octave`

### 5.2.346 File testing/sysfs-driver-hid-roccat-kone

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kone/roccatkone<minor>/actual_dpi`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kone/roccatkone<minor>/actual_profile`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kone/roccatkone<minor>/firmware_version`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kone/roccatkone<minor>/profile[1-5]`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kone/roccatkone<minor>/settings`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kone/roccatkone<minor>/startup_profile`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kone/roccatkone<minor>/tcu`

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kone/roccatkone<minor>/weight`

### 5.2.347 File testing/sysfs-driver-hid-srws1

Has the following ABI:

- `/sys/class/leds/SRWS1:<serial>::RPM1`
- `/sys/class/leds/SRWS1:<serial>::RPM2`

### 5.2.348 File testing/sysfs-driver-hid-wiimote

Has the following ABI:

- `/sys/bus/hid/drivers/wiimote/<dev>/led1`
- `/sys/bus/hid/drivers/wiimote/<dev>/led2`
- `/sys/bus/hid/drivers/wiimote/<dev>/led3`
- `/sys/bus/hid/drivers/wiimote/<dev>/led4`
- `/sys/bus/hid/drivers/wiimote/<dev>/extension`
- `/sys/bus/hid/drivers/wiimote/<dev>/devtype`
- `/sys/bus/hid/drivers/wiimote/<dev>/bboard_calib`
- `/sys/bus/hid/drivers/wiimote/<dev>/pro_calib`

### 5.2.349 File testing/sysfs-driver-input-axp-pek

Has the following ABI:

- */sys/class/input/input(x)/device/startup*
- */sys/class/input/input(x)/device/shutdown*

### 5.2.350 File testing/sysfs-driver-input-exc3000

Has the following ABI:

- */sys/bus/i2c/devices/xxx/fw\_version*
- */sys/bus/i2c/devices/xxx/model*

### 5.2.351 File testing/sysfs-driver-intel-m10-bmc

Has the following ABI:

- */sys/bus/spi/devices/…/bmc\_version*
- */sys/bus/spi/devices/…/bmcfw\_version*

### 5.2.352 File testing/sysfs-driver-intel-rapid-start

Has the following ABI:

- */sys/bus/acpi/intel-rapid-start/wakeup\_events*
- */sys/bus/acpi/intel-rapid-start/wakeup\_time*

### 5.2.353 File testing/sysfs-driver-jz4780-efuse

Has the following ABI:

- */sys/devices/\*/<our-device>/nvmem*

### 5.2.354 File testing/sysfs-driver-pciback

Has the following ABI:

- */sys/bus/pci/drivers/pciback/quirks*
- */sys/bus/pci/drivers/pciback/allow\_interrupt\_control*

### 5.2.355 File testing/sysfs-driver-ppi

Has the following ABI:

- */sys/class/tpm/tpmX/ppi/*
- */sys/class/tpm/tpmX/ppi/version*
- */sys/class/tpm/tpmX/ppi/request*
- */sys/class/tpm/tpmX/ppi/response*
- */sys/class/tpm/tpmX/ppi/transition\_action*
- */sys/class/tpm/tpmX/ppi/tcg\_operations*
- */sys/class/tpm/tpmX/ppi/vs\_operations*

### 5.2.356 File testing/sysfs-driver-samsung-laptop

Has the following ABI:

- */sys/devices/platform/samsung/performance\_level*
- */sys/devices/platform/samsung/battery\_life\_extender*
- */sys/devices/platform/samsung/usb\_charge*
- */sys/devices/platform/samsung/lid\_handling*

### 5.2.357 File testing/sysfs-driver-st

Has the following ABI:

- */sys/bus/scsi/drivers/st/debug\_flag*

### 5.2.358 File testing/sysfs-driver-tegra-fuse

Has the following ABI:

- */sys/devices/\*/<our-device>/fuse*

### 5.2.359 File testing/sysfs-driver-toshiba\_acpi

Has the following ABI:

- */sys/devices/LNXSYSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/kbd\_backlight\_mod*
- */sys/devices/LNXSYSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/kbd\_backlight\_time*
- */sys/devices/LNXSYSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/position*
- */sys/devices/LNXSYSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/touchpad*
- */sys/devices/LNXSYSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/available\_kbd\_mod*
- */sys/devices/LNXSYSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/kbd\_type*
- */sys/devices/LNXSYSYSTEM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/usb\_sleep\_charge*

- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/sleep_functions_on`
- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/usb_rapid_charge`
- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/usb_sleep_music`
- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/version`
- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/fan`
- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/kbd_function_keys`
- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/panel_power_on`
- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/usb_three`
- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS{1900,620{0,7,8}}:00/cooling_method`

### 5.2.360 File testing/sysfs-driver-toshiba\_haps

Has the following ABI:

- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS620A:00/protection_level`
- `/sys/devices/LNXSYSTM:00/LNXSYBUS:00/TOS620A:00/reset_protection`

### 5.2.361 File testing/sysfs-driver-typec-displayport

Has the following ABI:

- `/sys/bus/typec/devices/…/displayport/configuration`
- `/sys/bus/typec/devices/…/displayport/pin_assignment`

### 5.2.362 File testing/sysfs-driver-uacce

Has the following ABI:

- `/sys/class/uacce/<dev_name>/api`
- `/sys/class/uacce/<dev_name>/flags`
- `/sys/class/uacce/<dev_name>/available_instances`
- `/sys/class/uacce/<dev_name>/algorithms`
- `/sys/class/uacce/<dev_name>/region_mmio_size`
- `/sys/class/uacce/<dev_name>/region_dus_size`

### 5.2.363 File testing/sysfs-driver-ucsi-ccg

Has the following ABI:

- `/sys/bus/i2c/drivers/ucsi_ccg/…/do_flash`

### 5.2.364 File testing/sysfs-driver-ufs

Has the following ABI:

- `/sys/bus/*/drivers/ufshcd/*/auto_hibern8`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/device_type`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/device_class`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/device_sub_class`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/protocol`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/number_of_luns`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/number_of_wluns`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/boot_enable`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor(descriptor_access_enable`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor(initial_power_mode`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/high_priority_lun`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/secure_removal_type`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/support_security_lun`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/bkops_termination_latency`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/initial_active_icc_level`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/specification_version`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/manufacturing_date`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/manufacturer_id`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/rtt_capability`
- `/sys/bus/platform/drivers/ufshcd/*/device_descriptor/rtc_update`

### 5.2.365 File testing/sysfs-driver-w1\_ds28e17

Has the following ABI:

- */sys/bus/w1/devices/19-<id>/speed*
- */sys/bus/w1/devices/19-<id>/stretch*

### 5.2.366 File testing/sysfs-driver-w1\_therm

Has the following ABI:

- */sys/bus/w1/devices/…/alarms*
- */sys/bus/w1/devices/…/eeprom*
- */sys/bus/w1/devices/…/ext\_power*
- */sys/bus/w1/devices/…/resolution*
- */sys/bus/w1/devices/…/temperature*

- `/sys/bus/w1/devices/…/w1_slave`
- `/sys/bus/w1/devices/w1_bus_masterXX/therm_bulk_read`
- `/sys/bus/w1/devices/…/conv_time`
- `/sys/bus/w1/devices/…/features`

### 5.2.367 File testing/sysfs-driver-wacom

Has the following ABI:

- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/speed`
- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom_led/led`
- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom_led/status0_luminance`
- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom_led/status1_luminance`
- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom_led/status_led0_select`
- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom_led/status_led1_select`
- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom_led/buttons_luminance`
- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom_led/button<n>_rawimg`
- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom_remote/unpair_remote`
- `/sys/bus/hid/devices/<bus>:<vid>:<pid>.<n>/wacom_remote/<serial_number>/remote_`

### 5.2.368 File testing/sysfs-driver-xen-blkback

Has the following ABI:

- `/sys/module/xen_blkback/parameters/max_buffer_pages`
- `/sys/module/xen_blkback/parameters/max_persistent_grants`
- `/sys/module/xen_blkback/parameters/persistent_grant_unused_seconds`
- `/sys/module/xen_blkback/parameters/buffer_squeeze_duration_ms`
- `/sys/module/xen_blkback/parameters/feature_persistent`

### 5.2.369 File testing/sysfs-driver-xen-blkfront

Has the following ABI:

- `/sys/module/xen_blkfront/parameters/max_indirect_segments`
- `/sys/module/xen_blkfront/parameters/feature_persistent`

### 5.2.370 File testing/sysfs-firmware-acpi

Has the following ABI:

- */sys/firmware/acpi/bgrt/*
- */sys/firmware/acpi/hotplug/*
- */sys/firmware/acpi/interrupts/*

### 5.2.371 File testing/sysfs-firmware-dmi-entries

Has the following ABI:

- */sys/firmware/dmi/entries/*

### 5.2.372 File testing/sysfs-firmware-dmi-tables

Has the following ABI:

- */sys/firmware/dmi/tables/*

### 5.2.373 File testing/sysfs-firmware-efi

Has the following ABI:

- */sys/firmware/efi/fw\_vendor*
- */sys/firmware/efi/runtime*
- */sys/firmware/efi/config\_table*
- */sys/firmware/efi/systab*
- */sys/firmware/efi/tables/rcl2*

### 5.2.374 File testing/sysfs-firmware-efi-esrt

Has the following ABI:

- */sys/firmware/efi/esrt/*
- */sys/firmware/efi/esrt/fw\_resource\_count*
- */sys/firmware/efi/esrt/fw\_resource\_count\_max*
- */sys/firmware/efi/esrt/fw\_resource\_version*
- */sys/firmware/efi/esrt/entries/entry\$N/*
- */sys/firmware/efi/esrt/entries/entry\$N/fw\_type*
- */sys/firmware/efi/esrt/entries/entry\$N/fw\_class*
- */sys/firmware/efi/esrt/entries/entry\$N/fw\_version*
- */sys/firmware/efi/esrt/entries/entry\$N/lowest\_supported\_fw\_version*
- */sys/firmware/efi/esrt/entries/entry\$N/capsule\_flags*

- */sys/firmware/efi/esrt/entries/entry\$N/last\_attempt\_version*
- */sys/firmware/efi/esrt/entries/entry\$N/last\_attempt\_status*

### 5.2.375 File testing/sysfs-firmware-efi-runtime-map

Has the following ABI:

- */sys/firmware/efi/runtime-map/*

### 5.2.376 File testing/sysfs-firmware-gsmi

Has the following ABI:

- */sys/firmware/gsmi*

### 5.2.377 File testing/sysfs-firmware-log

Has the following ABI:

- */sys/firmware/log*

### 5.2.378 File testing/sysfs-firmware-memmap

Has the following ABI:

- */sys/firmware/memmap/*

### 5.2.379 File testing/sysfs-firmware-ofw

Has the following ABI:

- */sys/firmware/devicetree/\**
- */sys/firmware/fdt*

### 5.2.380 File testing/sysfs-firmware-opal-powercap

Has the following ABI:

- */sys/firmware/opal/powercap*
- */sys/firmware/opal/powercap/system-powercap*

### 5.2.381 File testing/sysfs-firmware-opal-psr

Has the following ABI:

- */sys/firmware/opal/psr*
- */sys/firmware/opal/psr/cpu\_to\_gpu\_X*

### 5.2.382 File testing/sysfs-firmware-opal-sensor-groups

Has the following ABI:

- */sys/firmware/opal/sensor\_groups*
- */sys/firmware/opal/sensor\_groups/<sensor\_group\_name>/clear*

### 5.2.383 File testing/sysfs-firmware-qemu\_fw\_cfg

Has the following ABI:

- */sys/firmware/qemu\_fv\_cfg/*

### 5.2.384 File testing/sysfs-firmware-sfi

Has the following ABI:

- */sys/firmware/sfi/tables/*

### 5.2.385 File testing/sysfs-firmware-sgi\_uv

Has the following ABI:

- */sys/firmware/sgi\_uv/*

### 5.2.386 File testing/sysfs-firmware-turris-mox-rwtm

Has the following ABI:

- */sys/firmware/turris-mox-rwtm/board\_version*
- */sys/firmware/turris-mox-rwtm/mac\_address\**
- */sys/firmware/turris-mox-rwtm/pubkey*
- */sys/firmware/turris-mox-rwtm/ram\_size*
- */sys/firmware/turris-mox-rwtm/serial\_number*

### 5.2.387 File testing/sysfs-fs-ext4

Has the following ABI:

- `/sys/fs/ext4/<disk>/mb_stats`
- `/sys/fs/ext4/<disk>/mb_group_prealloc`
- `/sys/fs/ext4/<disk>/mb_max_to_scan`
- `/sys/fs/ext4/<disk>/mb_min_to_scan`
- `/sys/fs/ext4/<disk>/mb_order2_req`
- `/sys/fs/ext4/<disk>/mb_stream_req`
- `/sys/fs/ext4/<disk>/inode_readahead_blks`
- `/sys/fs/ext4/<disk>/delayed_allocation_blocks`
- `/sys/fs/ext4/<disk>/lifetime_write_kbytes`
- `/sys/fs/ext4/<disk>/session_write_kbytes`
- `/sys/fs/ext4/<disk>/inode_goal`
- `/sys/fs/ext4/<disk>/max_writeback_mb_bump`
- `/sys/fs/ext4/<disk>/extent_max_zeroout_kb`
- `/sys/fs/ext4/<disk>/journal_task`

### 5.2.388 File testing/sysfs-f2fs

Has the following ABI:

- `/sys/fs/f2fs/<disk>/gc_max_sleep_time`
- `/sys/fs/f2fs/<disk>/gc_min_sleep_time`
- `/sys/fs/f2fs/<disk>/gc_no_gc_sleep_time`
- `/sys/fs/f2fs/<disk>/gc_idle`
- `/sys/fs/f2fs/<disk>/reclaim_segments`
- `/sys/fs/f2fs/<disk>/main_blkaddr`
- `/sys/fs/f2fs/<disk>/ipu_policy`
- `/sys/fs/f2fs/<disk>/min_ipu_util`
- `/sys/fs/f2fs/<disk>/min_fsync_blocks`
- `/sys/fs/f2fs/<disk>/min_seq_blocks`
- `/sys/fs/f2fs/<disk>/min_hot_blocks`
- `/sys/fs/f2fs/<disk>/min_ssr_sections`
- `/sys/fs/f2fs/<disk>/max_small_discards`
- `/sys/fs/f2fs/<disk>/discard_granularity`
- `/sys/fs/f2fs/<disk>/umount_discard_timeout`

- `/sys/fs/f2fs/<disk>/max_victim_search`
- `/sys/fs/f2fs/<disk>/migration_granularity`
- `/sys/fs/f2fs/<disk>/dir_level`
- `/sys/fs/f2fs/<disk>/ram_thresh`

- `/sys/fs/nilfs2/<device>/mounted_snapshots/<id>/inodes_count`
- `/sys/fs/nilfs2/<device>/mounted_snapshots/<id>/blocks_count`
- `/sys/fs/nilfs2/<device>/mounted_snapshots/<id>/README`

### 5.2.390 File testing/sysfs-fs-xfs

Has the following ABI:

- `/sys/fs/xfs/<disk>/log/log_head_lsn`
- `/sys/fs/xfs/<disk>/log/log_tail_lsn`
- `/sys/fs/xfs/<disk>/log/reserve_grant_head`
- `/sys/fs/xfs/<disk>/log/write_grant_head`

### 5.2.391 File testing/sysfs-hypervisor-xen

Has the following ABI:

- `/sys/hypervisor/guest_type`
- `/sys/hypervisor/pmu/pmu_mode`
- `/sys/hypervisor/pmu/pmu_features`
- `/sys/hypervisor/properties/buildid`

### 5.2.392 File testing/sysfs-ibft

Has the following ABI:

- */sys/firmware/ibft/initiator*
- */sys/firmware/ibft/targetX*
- */sys/firmware/ibft/ethernetX*
- */sys/firmware/ibft/acpi\_header*

### 5.2.393 File testing/sysfs-kernel-boot\_params

Has the following ABI:

- */sys/kernel/boot\_params*

### 5.2.394 File testing/sysfs-kernel-btf

Has the following ABI:

- */sys/kernel/btf*
- */sys/kernel/btf/vmlinux*

### 5.2.395 File testing/sysfs-kernel-fadump

Has the following ABI:

- */sys/kernel/fadump/\**
- */sys/kernel/fadump/enabled*
- */sys/kernel/fadump/registered*
- */sys/kernel/fadump/release\_mem*
- */sys/kernel/fadump/mem\_reserved*

### 5.2.396 File testing/sysfs-kernel-fscaps

Has the following ABI:

- */sys/kernel/fscaps*

### 5.2.397 File testing/sysfs-kernel-iommu\_groups

Has the following ABI:

- */sys/kernel/iommu\_groups/*
- */sys/kernel/iommu\_groups/reserved\_regions*
- */sys/kernel/iommu\_groups/reserved\_regions*

### 5.2.398 File testing/sysfs-kernel-irq

Has the following ABI:

- */sys/kernel/irq*
- */sys/kernel/irq/<irq>/actions*
- */sys/kernel/irq/<irq>/chip\_name*
- */sys/kernel/irq/<irq>/hwirq*
- */sys/kernel/irq/<irq>/name*
- */sys/kernel/irq/<irq>/per\_cpu\_count*
- */sys/kernel/irq/<irq>/type*
- */sys/kernel/irq/<irq>/wakeup*

### 5.2.399 File testing/sysfs-kernel-livepatch

Has the following ABI:

- */sys/kernel/livepatch*
- */sys/kernel/livepatch/<patch>*
- */sys/kernel/livepatch/<patch>/enabled*
- */sys/kernel/livepatch/<patch>/transition*
- */sys/kernel/livepatch/<patch>/force*
- */sys/kernel/livepatch/<patch>/<object>*
- */sys/kernel/livepatch/<patch>/<object>/<function,sympos>*

### 5.2.400 File testing/sysfs-kernel-mm

Has the following ABI:

- */sys/kernel/mm*

### 5.2.401 File testing/sysfs-kernel-mm-hugepages

Has the following ABI:

- */sys/kernel/mm/hugepages/*

### 5.2.402 File testing/sysfs-kernel-mm-ksm

Has the following ABI:

- */sys/kernel/mm/ksm*
- */sys/kernel/mm/ksm/full\_scans*
- */sys/kernel/mm/ksm/pages\_shared*
- */sys/kernel/mm/ksm/pages\_sharing*
- */sys/kernel/mm/ksm/pages\_to\_scan*
- */sys/kernel/mm/ksm/pages\_unshared*
- */sys/kernel/mm/ksm/pages\_volatile*
- */sys/kernel/mm/ksm/run*
- */sys/kernel/mm/ksm/sleep\_millisecs*
- */sys/kernel/mm/ksm/merge\_across\_nodes*

### 5.2.403 File testing/sysfs-kernel-mm-swap

Has the following ABI:

- */sys/kernel/mm/swap/*
- */sys/kernel/mm/swap/vma\_ra\_enabled*

### 5.2.404 File testing/sysfs-kernel-oops\_count

Has the following ABI:

- */sys/kernel/oops\_count*

### 5.2.405 File testing/sysfs-kernel-slab

Has the following ABI:

- */sys/kernel/slab*
- */sys/kernel/slab/cache/aliases*
- */sys/kernel/slab/cache/align*
- */sys/kernel/slab/cache/alloc\_calls*
- */sys/kernel/slab/cache/alloc\_fastpath*
- */sys/kernel/slab/cache/alloc\_from\_partial*

### 5.2.406 File testing/sysfs-kernel-vmcoreinfo

Has the following ABI:

- */sys/kernel/vmcoreinfo*

### 5.2.407 File testing/sysfs-kernel-warn\_count

Has the following ABI:

- */sys/kernel/warn\_count*

### 5.2.408 File testing/sysfs-memory-page-offline

Has the following ABI:

- */sys/devices/system/memory/soft\_offline\_page*
- */sys/devices/system/memory/hard\_offline\_page*

### 5.2.409 File testing/sysfs-module

Has the following ABI:

- */sys/module/pch\_phub/drivers/…/pch\_mac*
- */sys/module/pch\_phub/drivers/…/pch\_firmware*
- */sys/module/ehci\_hcd/drivers/…/uframe\_periodic\_max*
- */sys/module/\*/{coresize,initsize}*
- */sys/module/\*/taint*

### 5.2.410 File testing/sysfs-ocfs2

Has the following ABI:

- */sys/fs/ocfs2/*
- */sys/fs/ocfs2/max\_locking\_protocol*
- */sys/fs/ocfs2/loaded\_cluster\_plugins*
- */sys/fs/ocfs2/active\_cluster\_plugin*
- */sys/fs/ocfs2/cluster\_stack*

### 5.2.411 File testing/sysfs-platform-asus-laptop

Has the following ABI:

- */sys/devices/platform/asus\_laptop/display*
- */sys/devices/platform/asus\_laptop/gps*
- */sys/devices/platform/asus\_laptop/ledd*
- */sys/devices/platform/asus\_laptop/bluetooth*
- */sys/devices/platform/asus\_laptop/wlan*
- */sys/devices/platform/asus\_laptop/wimax*
- */sys/devices/platform/asus\_laptop/wwan*

### 5.2.412 File testing/sysfs-platform-asus-wmi

Has the following ABI:

- */sys/devices/platform/<platform>/cpufv*
- */sys/devices/platform/<platform>/camera*
- */sys/devices/platform/<platform>/cardr*
- */sys/devices/platform/<platform>/touchpad*
- */sys/devices/platform/<platform>/lid\_resume*
- */sys/devices/platform/<platform>/fan\_boost\_mode*
- */sys/devices/platform/<platform>/throttle\_thermal\_policy*
- */sys/devices/platform/<platform>/dgpu\_disable*

### 5.2.413 File testing/sysfs-platform-at91

Has the following ABI:

- */sys/devices/platform/at91\_can/net/<iface>/mb0\_id*

### 5.2.414 File testing/sysfs-platform-brcmstb-gisb-arb

Has the following ABI:

- */sys/devices/../../gisb\_arb\_timeout*

### 5.2.415 File testing/sysfs-platform-chipidea-usb-otg

Has the following ABI:

- */sys/bus/platform/devices/ci\_hdrc.0/inputs/a\_bus\_req*
- */sys/bus/platform/devices/ci\_hdrc.0/inputs/a\_bus\_drop*
- */sys/bus/platform/devices/ci\_hdrc.0/inputs/b\_bus\_req*
- */sys/bus/platform/devices/ci\_hdrc.0/inputs/a\_clr\_err*

### 5.2.416 File testing/sysfs-platform-chipidea-usb2

Has the following ABI:

- */sys/bus/platform/devices/ci\_hdrc.0/role*

### 5.2.417 File testing/sysfs-platform-dell-laptop

Has the following ABI:

- */sys/class/leds/dell::kbd\_backlight/als\_enabled*
- */sys/class/leds/dell::kbd\_backlight/als\_setting*
- */sys/class/leds/dell::kbd\_backlight/start\_triggers*
- */sys/class/leds/dell::kbd\_backlight/stop\_timeout*

### 5.2.418 File testing/sysfs-platform-dell-smbios

Has the following ABI:

- */sys/devices/platform/<platform>/tokens/\**

### 5.2.419 File testing/sysfs-platform-dfl-fme

Has the following ABI:

- `/sys/bus/platform/devices/dfl-fme.0/ports_num`
- `/sys/bus/platform/devices/dfl-fme.0/bitstream_id`
- `/sys/bus/platform/devices/dfl-fme.0/bitstream_metadata`
- `/sys/bus/platform/devices/dfl-fme.0/cache_size`
- `/sys/bus/platform/devices/dfl-fme.0/fabric_version`
- `/sys/bus/platform/devices/dfl-fme.0/socket_id`
- `/sys/bus/platform/devices/dfl-fme.0/errors/pcie0_errors`
- `/sys/bus/platform/devices/dfl-fme.0/errors/pcie1_errors`
- `/sys/bus/platform/devices/dfl-fme.0/errors/nonfatal_errors`
- `/sys/bus/platform/devices/dfl-fme.0/errors/catfatal_errors`
- `/sys/bus/platform/devices/dfl-fme.0/errors/inject_errors`
- `/sys/bus/platform/devices/dfl-fme.0/errors/fme_errors`
- `/sys/bus/platform/devices/dfl-fme.0/errors/first_error`
- `/sys/bus/platform/devices/dfl-fme.0/errors/next_error`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/name`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1_input`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1_max`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1_crit`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1_emergency`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1_max_alarm`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1_crit_alarm`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/temp1_max_policy`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1_input`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1_max`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1_crit`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1_max_alarm`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1_crit_alarm`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1_xeon_limit`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1_fpga_limit`
- `/sys/bus/platform/devices/dfl-fme.0/hwmon/hwmonX/power1_ltr`

### 5.2.420 File testing/sysfs-platform-dfl-port

Has the following ABI:

- `/sys/bus/platform/devices/dfl-port.0/id`
- `/sys/bus/platform/devices/dfl-port.0/afu_id`
- `/sys/bus/platform/devices/dfl-port.0/power_state`
- `/sys/bus/platform/devices/dfl-port.0/ap1_event`
- `/sys/bus/platform/devices/dfl-port.0/ap2_event`
- `/sys/bus/platform/devices/dfl-port.0/ltr`
- `/sys/bus/platform/devices/dfl-port.0/userclk_freqcmd`
- `/sys/bus/platform/devices/dfl-port.0/userclk_freqsts`
- `/sys/bus/platform/devices/dfl-port.0/userclk_freqcntrcmd`
- `/sys/bus/platform/devices/dfl-port.0/userclk_freqcntrsts`
- `/sys/bus/platform/devices/dfl-port.0/errors/errors`
- `/sys/bus/platform/devices/dfl-port.0/errors/first_error`
- `/sys/bus/platform/devices/dfl-port.0/errors/first_malformed_req`

### 5.2.421 File testing/sysfs-platform-dptf

Has the following ABI:

- `/sys/bus/platform/devices/INT3407:00/dptf_power/charger_type`
- `/sys/bus/platform/devices/INT3407:00/dptf_power/adapter_rating_mw`
- `/sys/bus/platform/devices/INT3407:00/dptf_power/max_platform_power_mw`
- `/sys/bus/platform/devices/INT3407:00/dptf_power/platform_power_source`
- `/sys/bus/platform/devices/INT3407:00/dptf_power/battery_steady_power`
- `/sys/bus/platform/devices/INT3407:00/dptf_power/rest_of_platform_power_mw`
- `/sys/bus/platform/devices/INT3407:00/dptf_power/prochot_confirm`
- `/sys/bus/platform/devices/INT3532:00/dptf_battery/max_platform_power_mw`
- `/sys/bus/platform/devices/INT3532:00/dptf_battery/max_steady_state_power_mw`
- `/sys/bus/platform/devices/INT3532:00/dptf_battery/high_freq_impedance_mohm`
- `/sys/bus/platform/devices/INT3532:00/dptf_battery/no_load_voltage_mv`
- `/sys/bus/platform/devices/INT3532:00/dptf_battery/current_discharge_capbility_ma`
- `/sys/bus/platform/devices/INTC1045:00/pch_fivr_switch_frequency/freq_mhz_low_clock`
- `/sys/bus/platform/devices/INTC1045:00/pch_fivr_switch_frequency/freq_mhz_high_clock`

### 5.2.422 File testing/sysfs-platform-eepc-laptop

Has the following ABI:

- */sys/devices/platform/eepc/disp*
- */sys/devices/platform/eepc/camera*
- */sys/devices/platform/eepc/cardr*
- */sys/devices/platform/eepc/cpufv*
- */sys/devices/platform/eepc/available\_cpufv*

### 5.2.423 File testing/sysfs-platform-hidma

Has the following ABI:

- */sys/devices/platform/hidma-\*/chid*

### 5.2.424 File testing/sysfs-platform-hidma-mgmt

Has the following ABI:

- */sys/devices/platform/hidma-mgmt\*/chanops/chan\*/priority*
- */sys/devices/platform/hidma-mgmt\*/chanops/chan\*/weight*
- */sys/devices/platform/hidma-mgmt\*/chreset\_timeout\_cycles*
- */sys/devices/platform/hidma-mgmt\*/dma\_channels*
- */sys/devices/platform/hidma-mgmt\*/hw\_version\_major*
- */sys/devices/platform/hidma-mgmt\*/hw\_version\_minor*
- */sys/devices/platform/hidma-mgmt\*/max\_rd\_xactions*
- */sys/devices/platform/hidma-mgmt\*/max\_read\_request*
- */sys/devices/platform/hidma-mgmt\*/max\_wr\_xactions*
- */sys/devices/platform/hidma-mgmt\*/max\_write\_request*

### 5.2.425 File testing/sysfs-platform-i2c-demux-pinctrl

Has the following ABI:

- */sys/devices/platform/<i2c-demux-name>/available\_masters*
- */sys/devices/platform/<i2c-demux-name>/current\_master*

### 5.2.426 File testing/sysfs-platform-ideapad-laptop

Has the following ABI:

- */sys/devices/platform/ideapad/camera\_power*
- */sys/devices/platform/ideapad/fan\_mode*
- */sys/devices/platform/ideapad/touchpad*
- */sys/bus/pci/devices/<bdf>/<device>/VPC2004:00/fn\_lock*

### 5.2.427 File testing/sysfs-platform-intel-wmi-sbl-fw-update

Has the following ABI:

- */sys/bus/wmi/devices/44FADEB1-B204-40F2-8581-394BBDC1B651/firmware\_update\_req*

### 5.2.428 File testing/sysfs-platform-intel-wmi-thunderbolt

Has the following ABI:

- */sys/devices/platform/<platform>/force\_power*

### 5.2.429 File testing/sysfs-platform-kim

Has the following ABI:

- */sys/devices/platform/kim/dev\_name*
- */sys/devices/platform/kim/baud\_rate*
- */sys/devices/platform/kim/flow\_cntrl*
- */sys/devices/platform/kim/install*

### 5.2.430 File testing/sysfs-platform-lg-laptop

Has the following ABI:

- */sys/devices/platform/lg-laptop/reader\_mode*
- */sys/devices/platform/lg-laptop/fn\_lock*
- */sys/devices/platform/lg-laptop/battery\_care\_limit*
- */sys/devices/platform/lg-laptop/fan\_mode*
- */sys/devices/platform/lg-laptop/usb\_charge*

### 5.2.431 File testing/sysfs-platform-mellanox-bootctl

Has the following ABI:

- */sys/bus/platform/devices/MLNXBF04:00/lifecycle\_state*
- */sys/bus/platform/devices/MLNXBF04:00/post\_reset\_wdog*
- */sys/bus/platform/devices/MLNXBF04:00/reset\_action*
- */sys/bus/platform/devices/MLNXBF04:00/second\_reset\_action*
- */sys/bus/platform/devices/MLNXBF04:00/secure\_boot\_fuse\_state*

### 5.2.432 File testing/sysfs-platform-msi-laptop

Has the following ABI:

- */sys/devices/platform/msi-laptop-pf/lcd\_level*
- */sys/devices/platform/msi-laptop-pf/auto\_brightness*
- */sys/devices/platform/msi-laptop-pf/wlan*
- */sys/devices/platform/msi-laptop-pf/bluetooth*
- */sys/devices/platform/msi-laptop-pf/touchpad*
- */sys/devices/platform/msi-laptop-pf/turbo\_mode*
- */sys/devices/platform/msi-laptop-pf/eco\_mode*
- */sys/devices/platform/msi-laptop-pf/turbo\_cooldown*
- */sys/devices/platform/msi-laptop-pf/auto\_fan*

### 5.2.433 File testing/sysfs-platform-phy-rcar-gen3-usb2

Has the following ABI:

- */sys/devices/platform/<phy-name>/role*

### 5.2.434 File testing/sysfs-platform-renesas\_usb3

Has the following ABI:

- */sys/devices/platform/<renesas\_usb3' s name>/role*

### 5.2.435 File testing/sysfs-platform-sst-atom

Has the following ABI:

- */sys/devices/platform/8086%00/firmware\_version*

### 5.2.436 File testing/sysfs-platform-tahvo-usb

Has the following ABI:

- */sys/bus/platform/devices/tahvo-usb/otg\_mode*
- */sys/bus/platform/devices/tahvo-usb/vbus*

### 5.2.437 File testing/sysfs-platform-ts5500

Has the following ABI:

- */sys/devices/platform/ts5500/adc*
- */sys/devices/platform/ts5500/ereset*
- */sys/devices/platform/ts5500/id*
- */sys/devices/platform/ts5500/jumpers*
- */sys/devices/platform/ts5500/name*
- */sys/devices/platform/ts5500/rs485*
- */sys/devices/platform/ts5500/sram*

### 5.2.438 File testing/sysfs-platform-tw14030-usb

Has the following ABI:

- */sys/bus/platform/devices/\*twl4030-usb/vbus*

### 5.2.439 File testing/sysfs-platform-usbip-vudc

Has the following ABI:

- */sys/devices/platform/usbip-vudc.%d/dev\_desc*
- */sys/devices/platform/usbip-vudc.%d/usbip\_status*
- */sys/devices/platform/usbip-vudc.%d/usbip\_sockfd*

### **5.2.440 File testing/sysfs-platform-wilco-ec**

Has the following ABI:

- */sys/bus/platform/devices/GOOG000C\:00/boot\_on\_ac*
- */sys/bus/platform/devices/GOOG000C\:00/build\_date*
- */sys/bus/platform/devices/GOOG000C\:00/build\_revision*
- */sys/bus/platform/devices/GOOG000C\:00/model\_number*
- */sys/bus/platform/devices/GOOG000C\:00/usb\_charge*
- */sys/bus/platform/devices/GOOG000C\:00/version*

### **5.2.441 File testing/sysfs-power**

Has the following ABI:

- */sys/power/*
- */sys/power/state*
- */sys/power/mem\_sleep*
- */sys/power/disk*
- */sys/power/image\_size*
- */sys/power/pm\_trace*
- */sys/power/pm\_async*
- */sys/power/wakeup\_count*
- */sys/power/reserved\_size*
- */sys/power/autosleep*
- */sys/power/wake\_lock*
- */sys/power/wake\_unlock*
- */sys/power/pm\_print\_times*
- */sys/power/pm\_wakeup\_irq*
- */sys/power/pm\_debug\_messages*
- */sys/power/resume\_offset*
- */sys/power/suspend\_stats*
- */sys/power/suspend\_stats/success*
- */sys/power/suspend\_stats/fail*
- */sys/power/suspend\_stats/failed\_freeze*
- */sys/power/suspend\_stats/failed\_prepare*
- */sys/power/suspend\_stats/failed\_resume*
- */sys/power/suspend\_stats/failed\_resume\_early*

- */sys/power/suspend\_stats/failed\_resume\_noirq*
- */sys/power/suspend\_stats/failed\_suspend*
- */sys/power/suspend\_stats/failed\_suspend\_late*
- */sys/power/suspend\_stats/failed\_suspend\_noirq*
- */sys/power/suspend\_stats/last\_failed\_dev*
- */sys/power/suspend\_stats/last\_failed\_errno*
- */sys/power/suspend\_stats/last\_failed\_step*
- */sys/power/sync\_on\_suspend*

### 5.2.442 File testing/sysfs-pps

Has the following ABI:

- */sys/class/pps/*
- */sys/class/pps/ppsX/*
- */sys/class/pps/ppsX/assert*
- */sys/class/pps/ppsX/clear*
- */sys/class/pps/ppsX mode*
- */sys/class/pps/ppsX/echo*
- */sys/class/pps/ppsX/name*
- */sys/class/pps/ppsX/path*

### 5.2.443 File testing/sysfs-profiling

Has the following ABI:

- */sys/kernel/profiling*

### 5.2.444 File testing/sysfs-ptp

Has the following ABI:

- */sys/class/ptp/*
- */sys/class/ptp/ptpN/*
- */sys/class/ptp/ptpN/clock\_name*
- */sys/class/ptp/ptpN/max\_adjustment*
- */sys/class/ptp/ptpN/n\_alarms*
- */sys/class/ptp/ptpN/n\_external\_timestamps*
- */sys/class/ptp/ptpN/n\_periodic\_outputs*
- */sys/class/ptp/ptpN/n\_pins*

- `/sys/class/ptp/ptpN/pins`
- `/sys/class/ptp/ptpN/pps_available`
- `/sys/class/ptp/ptpN/extts_enable`
- `/sys/class/ptp/ptpN/fifo`
- `/sys/class/ptp/ptpN/period`
- `/sys/class/ptp/ptpN/pps_enable`

### **5.2.445 File testing/sysfs-secvar**

Has the following ABI:

- `/sys/firmware/secvar`
- `/sys/firmware/secvar/vars`
- `/sys/firmware/secvar/format`
- `/sys/firmware/secvar/vars/<variable name>`
- `/sys/firmware/secvar/vars/<variable_name>/size`
- `/sys/firmware/secvar/vars/<variable_name>/data`
- `/sys/firmware/secvar/vars/<variable_name>/update`

### **5.2.446 File testing/sysfs-tty**

Has the following ABI:

- `/sys/class/tty/console/active`
- `/sys/class/tty/tty0/active`
- `/sys/class/tty/ttyS0/uartclk`
- `/sys/class/tty/ttyS0/type`
- `/sys/class/tty/ttyS0/line`
- `/sys/class/tty/ttyS0/port`
- `/sys/class/tty/ttyS0/irq`
- `/sys/class/tty/ttyS0 flags`
- `/sys/class/tty/ttyS0/xmit_fifo_size`
- `/sys/class/tty/ttyS0/close_delay`
- `/sys/class/tty/ttyS0/closing_wait`
- `/sys/class/tty/ttyS0/custom_divisor`
- `/sys/class/tty/ttyS0/io_type`
- `/sys/class/tty/ttyS0/iomem_base`
- `/sys/class/tty/ttyS0/iomem_reg_shift`

- */sys/class/tty/ttyS0/rx\_trig\_bytes*
- */sys/class/tty/ttyS0/console*

### 5.2.447 File testing/sysfs-uevent

Has the following ABI:

- */sys/…/uevent*

### 5.2.448 File testing/sysfs-wusb\_cbaf

Has the following ABI:

- */sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_\**
- */sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_chid*
- */sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_host\_name*
- */sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_host\_band\_groups*
- */sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_device\_band\_groups*
- */sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_cdid*
- */sys/bus/usb/drivers/wusb\_cbaf/…/wusb\_ck*

### 5.2.449 File testing/usb-charger-uevent

Has the following ABI:

- *Raise a uevent when a USB charger is inserted or removed*

### 5.2.450 File testing/usb-uevent

Has the following ABI:

- *Raise a uevent when a USB Host Controller has died*

## 5.3 ABI obsolete symbols

Documents interfaces that are still remaining in the kernel, but are marked to be removed at some later point in time.

The description of the interface will document the reason why it is obsolete and when it can be expected to be removed.

### 5.3.1 Symbols under /sys/bus

#### /sys/bus/platform/devices/INT34D2:00/northpeak

Defined on file *sysfs-driver-intel\_pmc\_bxt*

This interface allows userspace to enable and disable Northpeak through the PMC/SCU.

Format: %u.

#### /sys/bus/platform/devices/INT34D2:00/simplecmd

Defined on file *sysfs-driver-intel\_pmc\_bxt*

This interface allows userspace to send an arbitrary IPC command to the PMC/SCU.

Format: %d %d where first number is command and second number is subcommand.

#### /sys/bus/usb/devices/…/power/level

Defined on file *sysfs-bus-usb*

Each USB device directory will contain a file named power/level. This file holds a power-level setting for the device, either “on” or “auto” .

“on” means that the device is not allowed to autosuspend, although normal suspends for system sleep will still be honored. “auto” means the device will autosuspend and autoresume in the usual manner, according to the capabilities of its driver.

During normal use, devices should be left in the “auto” level. The “on” level is meant for administrative uses. If you want to suspend a device immediately but leave it free to wake up in response to I/O requests, you should write “0” to power/autosuspend.

Device not capable of proper suspend and resume should be left in the “on” level. Although the USB spec requires devices to support suspend/resume, many of them do not. In fact so many don’t that by default, the USB core initializes all non-hub devices in the “on” level. Some drivers may change this setting when they are bound.

This file is deprecated and will be removed after 2010. Use the power/control file instead; it does exactly the same thing.

#### /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/arvo/roccatarvo<minor>/actual\_profile

Defined on file *sysfs-driver-hid-roccat-arvo*

The integer value of this attribute ranges from 1-5. When read, this attribute returns the number of the actual profile which is also the profile that's active on device startup. When written this attribute activates the selected profile immediately.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/arvo/roccatarvo<minor>/button
```

---

Defined on file *sysfs-driver-hid-roccat-arvo*

The keyboard can store short macros with consist of 1 button with several modifier keys internally. When written, this file lets one set the sequence for a specific button for a specific profile. Button and profile numbers are included in written data. The data has to be 24 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/arvo/roccatarvo<minor>/info
```

---

Defined on file *sysfs-driver-hid-roccat-arvo*

When read, this file returns some info about the device like the installed firmware version. The size of the data is 8 bytes in size. This file is readonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/arvo/roccatarvo<minor>/key_mask
```

---

Defined on file *sysfs-driver-hid-roccat-arvo*

The keyboard lets the user deactivate 5 certain keys like the windows and application keys, to protect the user from the outcome of accidentally pressing them. The integer value of this attribute has bits 0-4 set depending on the state of the corresponding key. When read, this file returns the current state of the buttons. When written, the given buttons are activated/deactivated immediately.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/arvo/roccatarvo<minor>/mode_key
```

---

Defined on file *sysfs-driver-hid-roccat-arvo*

The keyboard has a condensed layout without num-lock key. Instead it uses a mode-key which activates a gaming mode where the assignment of the number block changes. The integer value of this attribute ranges from 0 (OFF) to 1 (ON). When read, this file returns the actual state of the key. When written, the key is activated/deactivated immediately.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/actual_profile
```

---

Defined on file *sysfs-driver-hid-roccat-isku*

The integer value of this attribute ranges from 0-4. When read, this attribute returns the number of the actual profile. This value is persistent, so its equivalent to the profile that's active when the device is powered on next time. When written, this file sets the number of the startup profile and the device activates this profile immediately.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/control
```

---

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one select which data from which profile will be read next. The data has to be 3 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/info
```

---

Defined on file *sysfs-driver-hid-roccat-isku*

When read, this file returns general data like firmware version. The data is 6 bytes long. This file is readonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/key_mask
```

---

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one deactivate certain keys like windows and application keys, to prevent accidental presses. Profile number for which this settings

occur is included in written data. The data has to be 6 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/keys_capslock
```

---

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one set the function of the capslock key for a specific profile. Profile number is included in written data. The data has to be 6 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/keys_easyzone
```

---

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one set the function of the easyzone keys for a specific profile. Profile number is included in written data. The data has to be 65 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/keys_function
```

---

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one set the function of the function keys for a specific profile. Profile number is included in written data. The data has to be 41 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/keys_macro
```

---

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one set the function of the macro keys for a specific profile. Profile number is included in written data. The data has to be 35 bytes

long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/keys_media
```

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one set the function of the media keys for a specific profile. Profile number is included in written data. The data has to be 29 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/keys_thumbster
```

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one set the function of the thumbster keys for a specific profile. Profile number is included in written data. The data has to be 23 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/last_set
```

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one set the time in secs since epoch in which the last configuration took place. The data has to be 20 bytes long.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/light
```

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one set the backlight intensity for a specific profile. Profile number is included in written data. The data has to be 10 bytes long for Isku, IskuFX needs 16 bytes of data. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/macro
```

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one store macros with max 500 keystrokes for a specific button for a specific profile. Button and profile numbers are included in written data. The data has to be 2083 bytes long. Before reading this file, control has to be written to select which profile and key to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/reset
```

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one reset the device. The data has to be 3 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/talk
```

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one trigger easyshift functionality from the host. The data has to be 16 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/isku/roccatisku<minor>/talkfx
```

Defined on file *sysfs-driver-hid-roccat-isku*

When written, this file lets one trigger temporary color schemes from the host. The data has to be 16 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/koneplus/roccatkoneplus<minor>/actual_profile
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

The integer value of this attribute ranges from 0-4. When read, this attribute returns the number of the actual profile. This value is persistent, so its equivalent to the profile that's active when the mouse is powered on next time. When written, this file sets the number of the startup profile and the mouse activates this profile immediately.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/koneplus/roccatkoneplus<minor>/firmware_version
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

When read, this file returns the raw integer version number of the firmware reported by the mouse. Using the integer value eases further usage in other programs. To receive the real version number the decimal point has to be shifted 2 positions to the left. E.g. a returned value of 121 means 1.21 This file is readonly. Please read binary attribute info which contains firmware version.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/koneplus/roccatkoneplus<minor>/info
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

When read, this file returns general data like firmware version. When written, the device can be reset. The data is 8 bytes long.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/koneplus/roccatkoneplus<minor>/macro
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

The mouse can store a macro with max 500 key/button strokes internally. When written, this file lets one set the sequence for a specific button for a specific profile. Button and profile numbers are included in written data. The data has to be 2082 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/koneplus/roccatkoneplus<minor>/profile[1-5]_buttons
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_buttons` holds information about button layout. When read, these files return the respective profile buttons. The returned data is 77 bytes in size. This file is readonly. Write control to select profile and read `profile_buttons` instead.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/koneplus/roccatkoneplus<minor>/profile[1-5]_settings
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_settings` holds information like resolution, sensitivity and light effects. When read, these files return the respective profile settings. The returned data is 43 bytes in size. This file is readonly. Write control to select profile and read `profile_settings` instead.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/koneplus/roccatkoneplus<minor>/profile_buttons
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_buttons` holds information about button layout. When written, this file lets one write the respective profile buttons back to the mouse. The data has to be 77 bytes long. The mouse will reject invalid data. Which profile to write is determined by the profile number contained in the data. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/koneplus/roccatkoneplus<minor>/profile_settings
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_settings` holds information like resolution, sensitivity and light effects. When written, this file lets one write the respective profile settings back to the mouse. The data has to be 43 bytes long. The mouse will reject invalid data. Which profile to write is determined by the

profile number contained in the data. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/koneplus/roccatkoneplus<minor>/sensor
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

The mouse has a tracking- and a distance-control-unit. These can be activated/deactivated and the lift-off distance can be set. The data has to be 6 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/koneplus/roccatkoneplus<minor>/startup_profile
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

The integer value of this attribute ranges from 0-4. When read, this attribute returns the number of the actual profile. This value is persistent, so its equivalent to the profile that's active when the mouse is powered on next time. When written, this file sets the number of the startup profile and the mouse activates this profile immediately. Please use actual\_profile, it does the same thing.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/koneplus/roccatkoneplus<minor>/talk
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

Used to active some easy\* functions of the mouse from outside. The data has to be 16 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/koneplus/roccatkoneplus<minor>/tcu
```

Defined on file *sysfs-driver-hid-roccat-koneplus*

When written a calibration process for the tracking control unit can be initiated/cancelled. Also lets one read/write sensor registers. The data has to be 4 bytes long.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/koneplus/roccatkoneplus<minor>/tcu_image
```

---

Defined on file *sysfs-driver-hid-roccat-koneplus*

When read the mouse returns a 30x30 pixel image of the sampled underground. This works only in the course of a calibration process initiated with tcu. The returned data is 1028 bytes in size. This file is readonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/konepure/roccatkonepure<minor>/actual_profile
```

---

Defined on file *sysfs-driver-hid-roccat-konepure*

The mouse can store 5 profiles which can be switched by the press of a button. actual\_profile holds number of actual profile. This value is persistent, so its value determines the profile that's active when the mouse is powered on next time. When written, the mouse activates the set profile immediately. The data has to be 3 bytes long. The mouse will reject invalid data.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/konepure/roccatkonepure<minor>/control
```

---

Defined on file *sysfs-driver-hid-roccat-konepure*

When written, this file lets one select which data from which profile will be read next. The data has to be 3 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/konepure/roccatkonepure<minor>/info
```

---

Defined on file *sysfs-driver-hid-roccat-konepure*

When read, this file returns general data like firmware version. When written, the device can be reset. The data is 6 bytes long.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/konepure/roccatkonepure<minor>/macro
```

Defined on file *sysfs-driver-hid-roccat-konepure*

The mouse can store a macro with max 500 key/button strokes internally. When written, this file lets one set the sequence for a specific button for a specific profile. Button and profile numbers are included in written data. The data has to be 2082 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/konepure/roccatkonepure<minor>/profile_buttons
```

Defined on file *sysfs-driver-hid-roccat-konepure*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_buttons` holds information about button layout. When written, this file lets one write the respective profile buttons back to the mouse. The data has to be 59 bytes long. The mouse will reject invalid data. Which profile to write is determined by the profile number contained in the data. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/konepure/roccatkonepure<minor>/profile_settings
```

Defined on file *sysfs-driver-hid-roccat-konepure*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_settings` holds information like resolution, sensitivity and light effects. When written, this file lets one write the respective profile settings back to the mouse. The data has to be 31 bytes long. The mouse will reject invalid data. Which profile to write is determined by the profile number contained in the data. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/konepure/roccatkonepure<minor>/sensor
```

Defined on file *sysfs-driver-hid-roccat-konepure*

The mouse has a tracking- and a distance-control-unit. These can be activated/deactivated and the lift-off distance can be set. The data has to be 6 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-

```

Defined on file *sysfs-driver-hid-roccat-konepure*

When read the mouse returns a 30x30 pixel image of the sampled underground. This works only in the course of a calibration process initiated with tcu. The returned data is 1028 bytes in size. This file is readonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kovaplus/roccatkovaplus<minor>/actual_cpi
```

Defined on file *sysfs-driver-hid-roccat-kovaplus*

The integer value of this attribute ranges from 1-4. When read, this attribute returns the number of the active cpi level. This file is readonly. Has never been used. If bookkeeping is done, it's done in userland tools.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/kovaplus/roccatkovaplus<minor>/actual_profile
```

Defined on file [sysfs-driver-hid-roccat-kovaplus](#)

The integer value of this attribute ranges from 0-4. When read, this attribute returns the number of the active profile. When written, the mouse activates this profile immediately. The profile that's active when powered down is the same that's active when the mouse is powered on.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/kovaplus/roccatkovaplus<minor>/actual_sensitivity_x
```

Defined on file [sysfs-driver-hid-roccat-kovaplus](#)

The integer value of this attribute ranges from 1-10. When read, this attribute returns the number of the actual sensitivity in x direction. This file is readonly. Has never been used. If bookkeeping is done, it's done in userland tools.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/kovaplus/roccatkovaplus<minor>/actual_sensitivity_y
```

Defined on file [sysfs-driver-hid-roccat-kovaplus](#)

The integer value of this attribute ranges from 1-10. When read, this attribute returns the number of the actual sensitivity in y direction. This file is readonly. Has never been used. If bookkeeping is done, it's done in userland tools.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/kovaplus/roccatkovaplus<minor>/firmware_version
```

Defined on file [sysfs-driver-hid-roccat-kovaplus](#)

When read, this file returns the raw integer version number of the firmware reported by the mouse. Using the integer value eases further usage in other programs. To receive the real version number the decimal point has to be shifted 2 positions to the left. E.g. a returned value of 121 means 1.21 This file is readonly. Obsoleted by binary sysfs attribute "info" .

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kovaplus/roccatkovaplus<minor>/info
```

---

Defined on file *sysfs-driver-hid-roccat-kovaplus*

When read, this file returns general data like firmware version. When written, the device can be reset. The data is 6 bytes long.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kovaplus/roccatkovaplus<minor>/profile[1-5]_buttons
```

---

Defined on file *sysfs-driver-hid-roccat-kovaplus*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_buttons` holds information about button layout. When read, these files return the respective profile buttons. The returned data is 23 bytes in size. This file is readonly. Write control to select profile and read `profile_buttons` instead.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kovaplus/roccatkovaplus<minor>/profile[1-5]_settings
```

---

Defined on file *sysfs-driver-hid-roccat-kovaplus*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_settings` holds information like resolution, sensitivity and light effects. When read, these files return the respective profile settings. The returned data is 16 bytes in size. This file is readonly. Write control to select profile and read `profile_settings` instead.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kovaplus/roccatkovaplus<minor>/profile_buttons
```

---

Defined on file *sysfs-driver-hid-roccat-kovaplus*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_buttons` holds information about button layout. When written, this file lets one write the respective profile buttons back to the mouse. The data has to be 23 bytes long. The mouse will reject invalid data. Which profile to write is determined by the profile number contained in the

data. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/kovaplus/roccatkovaplus<minor>/profile_settings
```

Defined on file *sysfs-driver-hid-roccat-kovaplus*

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split in settings and buttons. `profile_settings` holds information like resolution, sensitivity and light effects. When written, this file lets one write the respective profile settings back to the mouse. The data has to be 16 bytes long. The mouse will reject invalid data. Which profile to write is determined by the profile number contained in the data. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/pyra/roccatpyra<minor>/actual_cpi
```

Defined on file *sysfs-driver-hid-roccat-pyra*

It is possible to switch the cpi setting of the mouse with the press of a button. When read, this file returns the raw number of the actual cpi setting reported by the mouse. This number has to be further processed to receive the real dpi value:

VALUE	DPI
1	400
2	800
4	1600

This file is readonly. Has never been used. If bookkeeping is done, it's done in userland tools.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config

id>.<num>/pyra/roccatpyra<minor>/settings
```

---

Defined on file *sysfs-driver-hid-roccat-pyra*

When read, this file returns the settings stored in the mouse. The size of the data is 3 bytes and holds information on the `startup_profile`. When written, this file lets write settings back to the mouse. The data has to be 3 bytes long. The mouse will reject invalid data.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/pyra/roccatpyra<minor>/startup_profile
```

---

Defined on file *sysfs-driver-hid-roccat-pyra*

The integer value of this attribute ranges from 0-4. When read, this attribute returns the number of the profile that's active when the mouse is powered on. This file is readonly. Please use binary attribute "settings" which provides this information.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface          num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/ryos/roccatryos<minor>/control
```

---

Defined on file *sysfs-driver-hid-roccat-ryos*

When written, this file lets one select which data from which profile will be read next. The data has to be 3 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface          num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/ryos/roccatryos<minor>/custom_lights
```

---

Defined on file *sysfs-driver-hid-roccat-ryos*

When written, this file lets one set the actual per-key lighting. This attribute is only valid for the pro variant. The data has to be 20 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface          num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/ryos/roccatryos<minor>/info
```

---

Defined on file *sysfs-driver-hid-roccat-ryos*

When read, this file returns general data like firmware version. The data is 8 bytes long. This file is readonly.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface          num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/ryos/roccatryos<minor>/key_mask
```

---

Defined on file *sysfs-driver-hid-roccat-ryos*

When written, this file lets one deactivate certain keys like windows and application keys, to prevent accidental presses. Profile index for which this settings occur is included in written data. The data has to be 6 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/keys_easyzone
```

Defined on file *sysfs-driver-hid-roccat-ryos*

When written, this file lets one set the function of the easyzone keys for a specific profile. Profile index is included in written data. The data has to be 294 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/keys_extra
```

Defined on file *sysfs-driver-hid-roccat-ryos*

When written, this file lets one set the function of the capslock and function keys for a specific profile. Profile index is included in written data. The data has to be 8 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/keys_function
```

Defined on file *sysfs-driver-hid-roccat-ryos*

When written, this file lets one set the function of the function keys for a specific profile. Profile index is included in written data. The data has to be 95 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/keys_macro
```

Defined on file *sysfs-driver-hid-roccat-ryos*

When written, this file lets one set the function of the macro keys for a specific profile. Profile index is included in written data. The data has to be 35 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/ryos/roccatryos<minor>/keys_primary
```

---

Defined on file [sysfs-driver-hid-roccat-ryos](#)

When written, this file lets one set the default of all keys for a specific profile. Profile index is included in written data. The data has to be 125 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/ryos/roccatryos<minor>/keys_thumbster
```

---

Defined on file [sysfs-driver-hid-roccat-ryos](#)

When written, this file lets one set the function of the thumbster keys for a specific profile. Profile index is included in written data. The data has to be 23 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

---

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface           num>/<hid-bus>:<vendor-id>:<product-

id>.<num>/ryos/roccatryos<minor>/light_control
```

---

Defined on file [sysfs-driver-hid-roccat-ryos](#)

When written, this file lets one switch between stored and custom light settings. This attribute is only valid for the pro variant. The data has to be 8 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/light_macro
```

Defined on file [sysfs-driver-hid-roccat-ryos](#)

When written, this file lets one set a light macro that is looped whenever the device gets in dimness mode. This attribute is only valid for the pro variant. The data has to be 2002 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/macro
```

Defined on file [sysfs-driver-hid-roccat-ryos](#)

When written, this file lets one store macros with max 480 keystrokes for a specific button for a specific profile. Button and profile indexes are included in written data. The data has to be 2002 bytes long. Before reading this file, control has to be written to select which profile and key to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/profile
```

Defined on file [sysfs-driver-hid-roccat-ryos](#)

The mouse can store 5 profiles which can be switched by the press of a button. profile holds index of actual profile. This value is persistent, so its value determines the profile that's active when the device is powered on next time. When written, the device activates the set profile immediately. The data has to be 3 bytes long. The device will reject invalid data.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/reset
```

Defined on file [sysfs-driver-hid-roccat-ryos](#)

When written, this file lets one reset the device. The data has to be 3 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/stored_lights
```

Defined on file [sysfs-driver-hid-roccat-ryos](#)

When written, this file lets one set per-key lighting for different layers. This attribute is only valid for the pro variant. The data has to be 1382 bytes long. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/ryos/roccatryos<minor>/talk
```

Defined on file [sysfs-driver-hid-roccat-ryos](#)

When written, this file lets one trigger easyshift functionality from the host. The data has to be 16 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/savu/roccatsavu<minor>/buttons
```

Defined on file [sysfs-driver-hid-roccat-savu](#)

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split into general settings and button settings. The buttons variable holds information about button layout. When written, this file lets one write the respective profile buttons to the mouse. The data has to be 47 bytes long. The mouse will reject invalid data. Which profile to write is determined by the profile number contained in the data. Before reading this file, control has to be written to select which profile to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/savu/roccatsavu<minor>/control
```

Defined on file [sysfs-driver-hid-roccat-savu](#)

When written, this file lets one select which data from which profile will be read next. The data has to be 3 bytes long. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/savu/roccatsavu<minor>/general
```

Defined on file [sysfs-driver-hid-roccat-savu](#)

The mouse can store 5 profiles which can be switched by the press of a button. A profile is split into general settings and button settings. A profile holds information like resolution, sensitivity and light effects. When written, this file lets one write the respective profile settings back to the mouse. The data has to be 43 bytes long. The mouse will reject invalid data. Which profile to write is determined by the profile number contained in the data. This file is writeonly.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/savu/roccatsavu<minor>/info
```

Defined on file [sysfs-driver-hid-roccat-savu](#)

When read, this file returns general data like firmware version. When written, the device can be reset. The data is 8 bytes long.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/savu/roccatsavu<minor>/macro
```

Defined on file [sysfs-driver-hid-roccat-savu](#)

When written, this file lets one store macros with max 500 keystrokes for a specific button for a specific profile. Button and profile numbers are included in written data. The data has to be 2083 bytes long. Before reading this file, control has to be written to select which profile and key to read.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config  
num>.<interface num>/<hid-bus>:<vendor-id>:<product-  
id>.<num>/savu/roccatsavu<minor>/profile
```

Defined on file [sysfs-driver-hid-roccat-savu](#)

The mouse can store 5 profiles which can be switched by the press of a button. profile holds number of actual profile. This value is persistent, so its value determines the profile that's active when the mouse is powered on next time. When written, the mouse activates the set profile immediately. The data has to be 3 bytes long. The mouse will reject invalid data.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config
num>.<interface num>/<hid-bus>:<vendor-id>:<product-
id>.<num>/savu/roccatsavu<minor>/sensor
```

Defined on file *sysfs-driver-hid-roccat-savu*

The mouse has a Avago ADNS-3090 sensor. This file allows reading and writing of the mouse sensors registers. The data has to be 4 bytes long.

Users: <http://roccat.sourceforge.net>

```
/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface
num>/control
```

Defined on file *sysfs-driver-hid-roccat-lua*

When written, cpi, button and light settings can be configured. When read, actual cpi setting and sensor data are returned. The data has to be 8 bytes long.

Users: <http://roccat.sourceforge.net>

### 5.3.2 Symbols under /sys/class

```
/sys/class/dax/
```

Defined on file *sysfs-class-dax*

Device DAX is the device-centric analogue of Filesystem DAX (CONFIG\_FS\_DAX). It allows memory ranges to be allocated and mapped without need of an intervening file system. Device DAX is strict, precise and predictable. Specifically this interface:

1. Guarantees fault granularity with respect to a given page size (pte, pmd, or pud) set at configuration time.
2. Enforces deterministic behavior by being strict about what fault scenarios are supported.

The */sys/class/dax/* interface enumerates all the device-dax instances in the system. The ABI is deprecated and will be removed after 2020. It is replaced with the DAX bus interface */sys/bus/dax/* where device-dax instances can be found under */sys/bus/dax/devices/*

```
/sys/class/gpio/
```

Defined on file *sysfs-gpio*

As a Kconfig option, individual GPIO signals may be accessed from userspace. GPIOs are only made available to userspace by an explicit “export” operation. If a

given GPIO is not claimed for use by kernel code, it may be exported by userspace (and unexported later). Kernel code may export it for complete or partial access.

GPIOs are identified as they are inside the kernel, using integers in the range 0..INT\_MAX. See Documentation/admin-guide/gpio for more information.

```
/sys/class/gpio
    /export ... asks the kernel to export a GPIO to userspace
    /unexport ... to return a GPIO to the kernel
    /gpioN ... for each exported GPIO #N OR
    /<LINE-NAME> ... for a properly named GPIO line
        /value ... always readable, writes fail for input GPIOs
        /direction ... r/w as: in, out (default low); write: high, u
    ↵ low
        /edge ... r/w as: none, falling, rising, both
    /gpiochipN ... for each gpiochip; #N is its first GPIO
        /base ... (r/o) same as N
        /label ... (r/o) descriptive, not necessarily unique
        /ngpio ... (r/o) number of GPIOs; numbered N to N + (ngpio -
    ↵ 1)
```

This ABI is deprecated and will be removed after 2020. It is replaced with the GPIO character device.

### **/sys/class/net/<iface>/batman-adv/elp\_interval**

Defined on file *sysfs-class-net-batman-adv*

Defines the interval in milliseconds in which batman emits probing packets for neighbor sensing (ELP).

### **/sys/class/net/<iface>/batman-adv/iface\_status**

Defined on file *sysfs-class-net-batman-adv*

Indicates the status of <iface> as it is seen by batman.

### **/sys/class/net/<iface>/batman-adv/mesh\_iface**

Defined on file *sysfs-class-net-batman-adv*

The */sys/class/net/<iface>/batman-adv/mesh\_iface* file displays the batman mesh interface this <iface> currently is associated with.

### **/sys/class/net/<iface>/batman-adv/throughput\_override**

Defined on file *sysfs-class-net-batman-adv*

Defines the throughput value to be used by B.A.T.M.A.N. V when estimating the link throughput using this interface. If the value is set to 0 then batman-adv will try to estimate the throughput by itself.

**/sys/class/net/<mesh\_iface>/mesh/<vlan\_subdir>/ap\_isolation**

Defined on file *sysfs-class-net-mesh*

Indicates whether the data traffic going from a wireless client to another wireless client will be silently dropped. <vlan\_subdir> is empty when referring to the untagged lan.

**/sys/class/net/<mesh\_iface>/mesh/aggregated\_ogms**

Defined on file *sysfs-class-net-mesh*

Indicates whether the batman protocol messages of the mesh <mesh\_iface> shall be aggregated or not.

**/sys/class/net/<mesh\_iface>/mesh/bonding**

Defined on file *sysfs-class-net-mesh*

Indicates whether the data traffic going through the mesh will be sent using multiple interfaces at the same time (if available).

**/sys/class/net/<mesh\_iface>/mesh/bridge\_loop\_avoidance**

Defined on file *sysfs-class-net-mesh*

Indicates whether the bridge loop avoidance feature is enabled. This feature detects and avoids loops between the mesh and devices bridged with the soft interface <mesh\_iface>.

**/sys/class/net/<mesh\_iface>/mesh/fragmentation**

Defined on file *sysfs-class-net-mesh*

Indicates whether the data traffic going through the mesh will be fragmented or silently discarded if the packet size exceeds the outgoing interface MTU.

**/sys/class/net/<mesh\_iface>/mesh/gw\_bandwidth**

Defined on file *sysfs-class-net-mesh*

Defines the bandwidth which is propagated by this node if gw\_mode was set to ‘server’ .

**/sys/class/net/<mesh\_iface>/mesh/gw\_mode**

Defined on file *sysfs-class-net-mesh*

Defines the state of the gateway features. Can be either ‘off’ , ‘client’ or ‘server’ .

---

**/sys/class/net/<mesh\_iface>/mesh/gw\_sel\_class**

---

Defined on file *sysfs-class-net-mesh*

Defines the selection criteria this node will use to choose a gateway if gw\_mode was set to ‘client’ .

---

**/sys/class/net/<mesh\_iface>/mesh/hop\_penalty**

---

Defined on file *sysfs-class-net-mesh*

Defines the penalty which will be applied to an originator message’s tq-field on every hop.

---

**/sys/class/net/<mesh\_iface>/mesh/isolation\_mark**

---

Defined on file *sysfs-class-net-mesh*

Defines the isolation mark (and its bitmask) which is used to classify clients as “isolated” by the Extended Isolation feature.

---

**/sys/class/net/<mesh\_iface>/mesh/multicast\_mode**

---

Defined on file *sysfs-class-net-mesh*

Indicates whether multicast optimizations are enabled or disabled. If set to zero then all nodes in the mesh are going to use classic flooding for any multicast packet with no optimizations.

---

**/sys/class/net/<mesh\_iface>/mesh/network\_coding**

---

Defined on file *sysfs-class-net-mesh*

Controls whether Network Coding (using some magic to send fewer wifi packets but still the same content) is enabled or not.

---

**/sys/class/net/<mesh\_iface>/mesh/orig\_interval**

---

Defined on file *sysfs-class-net-mesh*

Defines the interval in milliseconds in which batman sends its protocol messages.

---

**/sys/class/net/<mesh\_iface>/mesh/routing\_algo**

---

Defined on file *sysfs-class-net-mesh*

Defines the routing protocol this mesh instance uses to find the optimal paths through the mesh.

---

**/sys/class/typec/<port|partner|cable>/<dev>/mode<index>/**

Defined on file *sysfs-class-typec*

Every supported mode will have its own directory. The name of a mode will be “mode<index>” (for example mode1), where <index> is the actual index to the mode VDO returned by Discover Modes USB power delivery command.

---

**/sys/class/typec/<port|partner|cable>/<dev>/mode<index>/active**

Defined on file *sysfs-class-typec*

Shows if the mode is active or not. The attribute can be used for entering/exiting the mode with partners and cable plugs, and with the port alternate modes it can be used for disabling support for specific alternate modes. Entering/exiting modes is supported as synchronous operation so write(2) to the attribute does not return until the enter/exit mode operation has finished. The attribute is notified when the mode is entered/exited so poll(2) on the attribute wakes up. Entering/exiting a mode will also generate uevent KOBJ\_CHANGE.

Valid values: yes, no

---

**/sys/class/typec/<port|partner|cable>/<dev>/mode<index>/description**

Defined on file *sysfs-class-typec*

Shows description of the mode. The description is optional for the drivers, just like with the Billboard Devices.

---

**/sys/class/typec/<port|partner|cable>/<dev>/mode<index>/vdo**

Defined on file *sysfs-class-typec*

Shows the VDO in hexadecimal returned by Discover Modes command for this mode.

---

**/sys/class/typec/<port|partner|cable>/<dev>/svid**

Defined on file *sysfs-class-typec*

The SVID (Standard or Vendor ID) assigned by USB-IF for this alternate mode.

### 5.3.3 Symbols under /sys/devices

---

#### /sys/devices/system/cpu/cpuidle/current\_governor\_ro

---

Defined on file *sysfs-cpuidle*

current\_governor\_ro shows current using cpuidle governor, but read only. with the update that cpuidle governor can be changed at runtime in default, both current\_governor and current\_governor\_ro co-exist under /sys/devices/system/cpu/cpuidle/ file, it's duplicate so make current\_governor\_ro obselete.

### 5.3.4 Symbols under /sys/firmware

---

#### /sys/firmware/acpi/hotplug/force\_remove

---

Defined on file *sysfs-firmware-acpi*

Since the force\_remove is inherently broken and dangerous to use for some hot-pluggable resources like memory (because ignoring the offline failure might lead to memory corruption and crashes) enabling this knob is not safe and thus unsupported.

### 5.3.5 Symbols under /sys/fs

---

#### /sys/fs/selinux/checkreqprot

---

Defined on file *sysfs-selinux-checkreqprot*

The selinuxfs “checkreqprot” node allows SELinux to be configured to check the protection requested by userspace for mmap/mprotect calls instead of the actual protection applied by the kernel. This was a compatibility mechanism for legacy userspace and for the READ\_IMPLIES\_EXEC personality flag. However, if set to 1, it weakens security by allowing mappings to be made executable without authorization by policy. The default value of checkreqprot at boot was changed starting in Linux v4.4 to 0 (i.e. check the actual protection), and Android and Linux distributions have been explicitly writing a “0” to */sys/fs/selinux/checkreqprot* during initialization for some time. Support for setting checkreqprot to 1 will be removed no sooner than June 2021, at which point the kernel will always cease using checkreqprot internally and will always check the actual protections being applied upon mmap/mprotect calls. The checkreqprot selinuxfs node will remain for backward compatibility but will discard writes of the “0” value and will reject writes of the “1” value when this mechanism is removed.

---

#### /sys/fs/selinux/disable

---

Defined on file *sysfs-selinux-disable*

The selinuxfs “disable” node allows SELinux to be disabled at runtime prior to a policy being loaded into the kernel. If disabled via this mechanism, SELinux will remain disabled until the system is rebooted.

The preferred method of disabling SELinux is via the “selinux=0” boot parameter, but the selinuxfs “disable” node was created to make it easier for systems with primitive bootloaders that did not allow for easy modification of the kernel command line. Unfortunately, allowing for SELinux to be disabled at runtime makes it difficult to secure the kernel’s LSM hooks using the “\_\_ro\_after\_init” feature.

Thankfully, the need for the SELinux runtime disable appears to be gone, the default Kconfig configuration disables this selinuxfs node, and only one of the major distributions, Fedora, supports disabling SELinux at runtime. Fedora is in the process of removing the selinuxfs “disable” node and once that is complete we will start the slow process of removing this code from the kernel.

More information on [\*/sys/fs/selinux/disable\*](#) can be found under the CONFIG\_SECURITY\_SELINUX\_DISABLE Kconfig option.

### 5.3.6 Symbols under /sys/kernel

#### **/sys/kernel/fadump\_enabled**

Defined on file [\*sysfs-kernel-fadump\\_enabled\*](#)

read only Primarily used to identify whether the FADump is enabled in the kernel or not. User: Kdump service

#### **/sys/kernel/fadump\_registered**

Defined on file [\*sysfs-kernel-fadump\\_registered\*](#)

read/write Helps to control the dump collect feature from userspace. Setting 1 to this file enables the system to collect the dump and 0 to disable it. User: Kdump service

#### **/sys/kernel/fadump\_release\_mem**

Defined on file [\*sysfs-kernel-fadump\\_release\\_mem\*](#)

write only This is a special sysfs file and only available when the system is booted to capture the vmcore using FADump. It is used to release the memory reserved by FADump to save the crash dump.

### 5.3.7 File obsolete/sysfs-bus-usb

Has the following ABI:

- */sys/bus/usb/devices/…/power/level*

### 5.3.8 File obsolete/sysfs-class-dax

Has the following ABI:

- */sys/class/dax/*

### 5.3.9 File obsolete/sysfs-class-net-batman-adv

This ABI is deprecated and will be removed after 2021. It is replaced with the batadv generic netlink family.

Has the following ABI:

- */sys/class/net/<iface>/batman-adv/elp\_interval*
- */sys/class/net/<iface>/batman-adv/iface\_status*
- */sys/class/net/<iface>/batman-adv/mesh\_iface*
- */sys/class/net/<iface>/batman-adv/throughput\_override*

### 5.3.10 File obsolete/sysfs-class-net-mesh

This ABI is deprecated and will be removed after 2021. It is replaced with the batadv generic netlink family.

Has the following ABI:

- */sys/class/net/<mesh\_iface>/mesh/aggregated\_ogms*
- */sys/class/net/<mesh\_iface>/mesh/<vlan\_subdir>/ap\_isolation*
- */sys/class/net/<mesh\_iface>/mesh/bonding*
- */sys/class/net/<mesh\_iface>/mesh/bridge\_loop\_avoidance*
- */sys/class/net/<mesh\_iface>/mesh/fragmentation*
- */sys/class/net/<mesh\_iface>/mesh/gw\_bandwidth*
- */sys/class/net/<mesh\_iface>/mesh/gw\_mode*
- */sys/class/net/<mesh\_iface>/mesh/gw\_sel\_class*
- */sys/class/net/<mesh\_iface>/mesh/hop\_penalty*
- */sys/class/net/<mesh\_iface>/mesh/isolation\_mark*
- */sys/class/net/<mesh\_iface>/mesh/multicast\_mode*
- */sys/class/net/<mesh\_iface>/mesh/network\_coding*
- */sys/class/net/<mesh\_iface>/mesh/orig\_interval*

- `/sys/class/net/<mesh_iface>/mesh/routing_algo`

### 5.3.11 File obsolete/sysfs-class-typec

These files are deprecated and will be removed. The same files are available under `/sys/bus/typec` (see [testing/sysfs-bus-typec](#)).

Has the following ABI:

- `/sys/class/typec/<port|partner|cable>/<dev>/svid`
- `/sys/class/typec/<port|partner|cable>/<dev>/mode<index>/`
- `/sys/class/typec/<port|partner|cable>/<dev>/mode<index>/description`
- `/sys/class/typec/<port|partner|cable>/<dev>/mode<index>/vdo`
- `/sys/class/typec/<port|partner|cable>/<dev>/mode<index>/active`

### 5.3.12 File obsolete/sysfs-cpuidle

Has the following ABI:

- `/sys/devices/system/cpu/cpuidle/current_governor_ro`

### 5.3.13 File obsolete/sysfs-driver-hid-roccat-arvo

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface<num>/<hid-bus>:<vendor-id>:<product-id>.arvo/roccatarvo<minor>/actual_profile`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface<num>/<hid-bus>:<vendor-id>:<product-id>.arvo/roccatarvo<minor>/button`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface<num>/<hid-bus>:<vendor-id>:<product-id>.arvo/roccatarvo<minor>/info`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface<num>/<hid-bus>:<vendor-id>:<product-id>.arvo/roccatarvo<minor>/key_mask`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.interface<num>/<hid-bus>:<vendor-id>:<product-id>.arvo/roccatarvo<minor>/mode_key`

### 5.3.14 File obsolete/sysfs-driver-hid-roccat-isku

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/actual_profile`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/info`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/key_mask`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/keys_capslock`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/keys_easyzone`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/keys_function`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/keys_macro`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/keys_media`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/keys_thumbster`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/last_set`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/light`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/macro`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/reset`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config`

- num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/control*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/talk*
  - */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/isku/roccatisku<minor>/talkfx*

### 5.3.15 File obsolete/sysfs-driver-hid-roccat-koneplus

Has the following ABI:

- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/koneplus/roccatkoneplus<minor>/actual\_profile*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/koneplus/roccatkoneplus<minor>/startup\_profile*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/koneplus/roccatkoneplus<minor>/firmware\_version*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/koneplus/roccatkoneplus<minor>/info*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/koneplus/roccatkoneplus<minor>/macro*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/koneplus/roccatkoneplus<minor>/profile\_buttons*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/koneplus/roccatkoneplus<minor>/profile[1-5]\_buttons*

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/koneplus/roccatkoneplus<minor>/tcu_image`

### 5.3.16 File obsolete/sysfs-driver-hid-roccat-konepure

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/actual_profile`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/control`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/info`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/macro`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/profile_buttons`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/profile_settings`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/sensor`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/talk`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/tcu`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/konepure/roccatkonepure<minor>/tcu_image`

### 5.3.17 File obsolete/sysfs-driver-hid-roccat-kovaplus

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/actual_cpi`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/actual_profile`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/actual_sensitivity_x`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/actual_sensitivity_y`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/firmware_version`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/info`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/profile_buttons`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/profile[1-5]_buttons`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/profile_settings`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/kovaplus/roccatkovaplus<minor>/profile[1-5]_settings`

### 5.3.18 File obsolete/sysfs-driver-hid-roccat-lua

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>/control`

### 5.3.19 File obsolete/sysfs-driver-hid-roccat-pyra

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/actual_cpi`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/actual_profile`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/firmware_version`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/info`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/profile_buttons`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/profile[1-5]_buttons`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/profile_settings`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/profile[1-5]_settings`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/settings`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/pyra/roccatpyra<minor>/startup_profile`

### 5.3.20 File obsolete/sysfs-driver-hid-roccat-ryos

Has the following ABI:

- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/control`
- `/sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/profile`

- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/keys\_primary
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/keys\_function
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/keys\_macro
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/keys\_thumbster
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/keys\_extra
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/keys\_easyzone
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/key\_mask
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/light
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/macro
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/info
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/reset
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/talk
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/light\_control
- /sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/stored\_lights
- /sys/bus/usb/devices/<busnum>-<devnum>:<config

- num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/custom\_lights*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/ryos/roccatryos<minor>/light\_macro*

### 5.3.21 File obsolete/sysfs-driver-hid-roccat-savu

Has the following ABI:

- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/savu/roccatsavu<minor>/buttons*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/savu/roccatsavu<minor>/control*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/savu/roccatsavu<minor>/general*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/savu/roccatsavu<minor>/info*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/savu/roccatsavu<minor>/macro*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/savu/roccatsavu<minor>/profile*
- */sys/bus/usb/devices/<busnum>-<devnum>:<config num>.<interface num>/<hid-bus>:<vendor-id>:<product-id>.<num>/savu/roccatsavu<minor>/sensor*

### 5.3.22 File obsolete/sysfs-driver-intel\_pmc\_bxt

These files allow sending arbitrary IPC commands to the PMC/SCU which may be dangerous. These will be removed eventually and should not be used in any new applications.

Has the following ABI:

- */sys/bus/platform/devices/INT34D2:00/simplecmd*
- */sys/bus/platform/devices/INT34D2:00/northpeak*

### 5.3.23 File obsolete/sysfs-firmware-acpi

Has the following ABI:

- */sys/firmware/acpi/hotplug/force\_remove*

### 5.3.24 File obsolete/sysfs-gpio

Has the following ABI:

- */sys/class/gpio/*

### 5.3.25 File obsolete/sysfs-kernel-fadump\_enabled

This ABI is renamed and moved to a new location */sys/kernel/fadump/enabled*.  
→

Has the following ABI:

- */sys/kernel/fadump\_enabled*

### 5.3.26 File obsolete/sysfs-kernel-fadump\_registered

This ABI is renamed and moved to a new location */sys/kernel/fadump/registered*.  
→

Has the following ABI:

- */sys/kernel/fadump\_registered*

### 5.3.27 File obsolete/sysfs-kernel-fadump\_release\_mem

This ABI is renamed and moved to a new location */sys/kernel/fadump/release\_mem*.  
→

Has the following ABI:

- */sys/kernel/fadump\_release\_mem*

### 5.3.28 File obsolete/sysfs-selinux-checkreqprot

Has the following ABI:

- */sys/fs/selinux/checkreqprot*

### 5.3.29 File obsolete/sysfs-selinux-disable

Has the following ABI:

- */sys/fs/selinux/disable*

## 5.4 ABI removed symbols

### 5.4.1 Symbols under /sys/bus

#### **/sys/bus/nd/devices/regionX/nfit/ecc\_unit\_size**

Defined on file *sysfs-bus-nfit*

(RO) Size of a write request to a DIMM that will not incur a read-modify-write cycle at the memory controller.

When the nfit driver initializes it runs an ARS (Address Range Scrub) operation across every pmem range. Part of that process involves determining the ARS capabilities of a given address range. One of the capabilities that is reported is the ‘Clear Uncorrectable Error Range Length Unit Size’ (see: ACPI 6.2 section 9.20.7.4 Function Index 1 - Query ARS Capabilities). This property indicates the boundary at which the NVDIMM may need to perform read-modify-write cycles to maintain ECC (Error Correcting Code) blocks.

### 5.4.2 Symbols under /sys/class

#### **/sys/class/rfkill/rfkill[0-9]+/claim**

Defined on file *sysfs-class-rfkill*

This file was deprecated because there no longer was a way to claim just control over a single rfkill instance. This file was scheduled to be removed in 2012, and was removed in 2016. Values: 0: Kernel handles events

### 5.4.3 Symbols under /sys/kernel

#### **/sys/kernel/fadump\_release\_opalcore**

Defined on file *sysfs-kernel-fadump\_release\_opalcore*

write only The sysfs file is available when the system is booted to collect the dump on OPAL based machine. It used to release the memory used to collect the opalcore.

#### **/sys/kernel/uids/<uid>/cpu\_shares**

Defined on file *sysfs-kernel-uids*

The */sys/kernel/uids/<uid>/cpu\_shares* tunable is used to set the cpu bandwidth a user is allowed. This is a proportional value. What that means is that if there are two users logged in, each with an equal number of shares, then they will get equal CPU bandwidth. Another example would be, if User A has shares = 1024 and user B has shares = 2048, User B will get twice the CPU bandwidth user A will. For more details refer /scheduler/sched-design-CFS

#### 5.4.4 Symbols under */sys/o2cb*

##### **/sys/o2cb symlink**

Defined on file *o2cb*

This is a symlink: */sys/o2cb* to */sys/fs/o2cb*. The symlink is removed when new versions of ocfs2-tools which know to look in */sys/fs/o2cb* are sufficiently prevalent. Don't code new software to look here, it should try */sys/fs/o2cb* instead.

Users: ocfs2-tools. It's sufficient to mail proposed changes to [ocfs2-devel@oss.oracle.com](mailto:ocfs2-devel@oss.oracle.com).

#### 5.4.5 devfs

##### **devfs**

Defined on file *devfs*

devfs has been unmaintained for a number of years, has unfixable races, contains a naming policy within the kernel that is against the LSB, and can be replaced by using udev.

The files *fs/devfs/*, *include/linux/devfs\_fs.h* were removed, along with the assorted devfs function calls throughout the kernel tree.

#### 5.4.6 Symbols under *dv1394*

##### **dv1394 (a.k.a. “OHCI-DV I/O support” for FireWire)**

Defined on file *dv1394*

*/dev/dv1394/\** were character device files, one for each FireWire controller and for NTSC and PAL respectively, from which DV data could be received by *read()* or transmitted by *write()*. A few *ioctl()*s allowed limited control. This special-purpose interface has been superseded by *libraw1394* + *libiec61883* which are functionally equivalent, support HDV, and transparently work on top of the newer firewire kernel drivers.

Users:

ffmpeg/libavformat (if configured for DV1394)

#### 5.4.7 ip\_queue

##### **ip\_queue**

Defined on file *ip\_queue*

ip\_queue has been replaced by nfnetlink\_queue which provides more advanced queueing mechanism to user-space. The ip\_queue module was already announced to become obsolete years ago.

#### 5.4.8 Symbols under raw1394

##### **raw1394 (a.k.a. “Raw IEEE1394 I/O support” for FireWire)**

Defined on file *raw1394*

/dev/raw1394 was a character device file that allowed low-level access to FireWire buses. Its major drawbacks were its inability to implement sensible device security policies, and its low level of abstraction that required userspace clients to duplicate much of the kernel’s ieee1394 core functionality.

Replaced by /dev/fw\*, i.e. the <linux/firewire-cdev.h> ABI of firewire-core.

Users:

libraw1394 (works with firewire-cdev too, transparent to library ABI users)

#### 5.4.9 tcp\_dma\_copybreak sysctl

##### **tcp\_dma\_copybreak sysctl**

Defined on file *net\_dma*

Formerly the lower limit, in bytes, of the size of socket reads that will be offloaded to a DMA copy engine. Removed due to coherency issues of the cpu potentially touching the buffers while dma is in flight.

### 5.4.10 `video1394` (a.k.a. “OHCI-1394 Video support” for FireWire)

#### `video1394` (a.k.a. “OHCI-1394 Video support” for FireWire)

Defined on file `video1394`

`/dev/video1394/*` were character device files, one for each FireWire controller, which were used for isochronous I/O. It was added as an alternative to `raw1394`'s isochronous I/O functionality which had performance issues in its first generation. Any `video1394` user had to use `raw1394 + libraw1394` too because `video1394` did not provide asynchronous I/O for device discovery and configuration.

Replaced by `/dev/fw*`, i.e. the `<linux/firewire-cdev.h>` ABI of `firewire-core`.

Users:

`libdc1394` (works with `firewire-cdev` too, transparent to library ABI users)

### 5.4.11 File removed/`devfs`

Has the following ABI:

- `devfs`

### 5.4.12 File removed/`dv1394`

Has the following ABI:

- `dv1394` (a.k.a. “OHCI-DV I/O support” for FireWire)

### 5.4.13 File removed/`ip_queue`

Has the following ABI:

- `ip_queue`

### 5.4.14 File removed/`net_dma`

Has the following ABI:

- `tcp_dma_copybreak sysctl`

### 5.4.15 File removed/o2cb

Has the following ABI:

- `/sys/o2cb symlink`

### 5.4.16 File removed/raw1394

Has the following ABI:

- `raw1394` (a.k.a. “Raw IEEE1394 I/O support” for FireWire)

### 5.4.17 File removed/sysfs-bus-nfit

Has the following ABI:

- `/sys/bus/nd/devices/regionX/nfit/ecc_unit_size`

### 5.4.18 File removed/sysfs-class-rfkill

rfkill - radio frequency (RF) connector kill switch support

For details to this subsystem look at /driver-api/rfkill.

Has the following ABI:

- `/sys/class/rfkill/rfkill[0-9]+/claim`

### 5.4.19 File removed/sysfs-kernel-fadump\_release\_opalcore

This ABI is moved to /sys/firmware/opal/mpipl/release\_core.

Has the following ABI:

- `/sys/kernel/fadump_release_opalcore`

### 5.4.20 File removed/sysfs-kernel-uids

Has the following ABI:

- `/sys/kernel/uids/<uid>/cpu_shares`

### 5.4.21 File removed/video1394

Has the following ABI:

- `video1394` (a.k.a. “OHCI-1394 Video support” for FireWire)

This section describes CPU vulnerabilities and their mitigations.

## **HARDWARE VULNERABILITIES**

This section describes CPU vulnerabilities and provides an overview of the possible mitigations along with guidance for selecting mitigations if they are configurable at compile, boot or run time.

### **6.1 Spectre Side Channels**

Spectre is a class of side channel attacks that exploit branch prediction and speculative execution on modern CPUs to read memory, possibly bypassing access controls. Speculative execution side channel exploits do not modify memory but attempt to infer privileged data in the memory.

This document covers Spectre variant 1 and Spectre variant 2.

#### **6.1.1 Affected processors**

Speculative execution side channel methods affect a wide range of modern high performance processors, since most modern high speed processors use branch prediction and speculative execution.

The following CPUs are vulnerable:

- Intel Core, Atom, Pentium, and Xeon processors
- AMD Phenom, EPYC, and Zen processors
- IBM POWER and zSeries processors
- Higher end ARM processors
- Apple CPUs
- Higher end MIPS CPUs
- Likely most other high performance CPUs. Contact your CPU vendor for details.

Whether a processor is affected or not can be read out from the Spectre vulnerability files in sysfs. See *Spectre system information*.

### **6.1.2 Related CVEs**

The following CVE entries describe Spectre variants:

CVE-2017-5753	Bounds check bypass	Spectre variant 1
CVE-2017-5715	Branch target injection	Spectre variant 2
CVE-2019-1125	Spectre v1 swapgs	Spectre variant 1 (swapgs)

### **6.1.3 Problem**

CPUs use speculative operations to improve performance. That may leave traces of memory accesses or computations in the processor's caches, buffers, and branch predictors. Malicious software may be able to influence the speculative execution paths, and then use the side effects of the speculative execution in the CPUs' caches and buffers to infer privileged data touched during the speculative execution.

Spectre variant 1 attacks take advantage of speculative execution of conditional branches, while Spectre variant 2 attacks use speculative execution of indirect branches to leak privileged memory. See [\[1\]](#) [\[5\]](#) [\[6\]](#) [\[7\]](#) [\[10\]](#) [\[11\]](#).

### **6.1.4 Spectre variant 1 (Bounds Check Bypass)**

The bounds check bypass attack [\[2\]](#) takes advantage of speculative execution that bypasses conditional branch instructions used for memory access bounds check (e.g. checking if the index of an array results in memory access within a valid range). This results in memory accesses to invalid memory (with out-of-bound index) that are done speculatively before validation checks resolve. Such speculative memory accesses can leave side effects, creating side channels which leak information to the attacker.

There are some extensions of Spectre variant 1 attacks for reading data over the network, see [\[12\]](#). However such attacks are difficult, low bandwidth, fragile, and are considered low risk.

Note that, despite "Bounds Check Bypass" name, Spectre variant 1 is not only about user-controlled array bounds checks. It can affect any conditional checks. The kernel entry code interrupt, exception, and NMI handlers all have conditional swapgs checks. Those may be problematic in the context of Spectre v1, as kernel code can speculatively run with a user GS.

### 6.1.5 Spectre variant 2 (Branch Target Injection)

The branch target injection attack takes advantage of speculative execution of indirect branches [3]. The indirect branch predictors inside the processor used to guess the target of indirect branches can be influenced by an attacker, causing gadget code to be speculatively executed, thus exposing sensitive data touched by the victim. The side effects left in the CPU's caches during speculative execution can be measured to infer data values.

In Spectre variant 2 attacks, the attacker can steer speculative indirect branches in the victim to gadget code by poisoning the branch target buffer of a CPU used for predicting indirect branch addresses. Such poisoning could be done by indirect branching into existing code, with the address offset of the indirect branch under the attacker's control. Since the branch prediction on impacted hardware does not fully disambiguate branch address and uses the offset for prediction, this could cause privileged code's indirect branch to jump to a gadget code with the same offset.

The most useful gadgets take an attacker-controlled input parameter (such as a register value) so that the memory read can be controlled. Gadgets without input parameters might be possible, but the attacker would have very little control over what memory can be read, reducing the risk of the attack revealing useful data.

One other variant 2 attack vector is for the attacker to poison the return stack buffer (RSB) [13] to cause speculative subroutine return instruction execution to go to a gadget. An attacker's imbalanced subroutine call instructions might "poison" entries in the return stack buffer which are later consumed by a victim's subroutine return instructions. This attack can be mitigated by flushing the return stack buffer on context switch, or virtual machine (VM) exit.

On systems with simultaneous multi-threading (SMT), attacks are possible from the sibling thread, as level 1 cache and branch target buffer (BTB) may be shared between hardware threads in a CPU core. A malicious program running on the sibling thread may influence its peer's BTB to steer its indirect branch speculations to gadget code, and measure the speculative execution's side effects left in level 1 cache to infer the victim's data.

Yet another variant 2 attack vector is for the attacker to poison the Branch History Buffer (BHB) to speculatively steer an indirect branch to a specific Branch Target Buffer (BTB) entry, even if the entry isn't associated with the source address of the indirect branch. Specifically, the BHB might be shared across privilege levels even in the presence of Enhanced IBRS.

Currently the only known real-world BHB attack vector is via unprivileged eBPF. Therefore, it's highly recommended to not enable unprivileged eBPF, especially when eIBRS is used (without retrpolines). For a full mitigation against BHB attacks, it's recommended to use retrpolines (or eIBRS combined with retrpolines).

### 6.1.6 Attack scenarios

The following list of attack scenarios have been anticipated, but may not cover all possible attack vectors.

#### 1. A user process attacking the kernel

##### Spectre variant 1

The attacker passes a parameter to the kernel via a register or via a known address in memory during a syscall. Such parameter may be used later by the kernel as an index to an array or to derive a pointer for a Spectre variant 1 attack. The index or pointer is invalid, but bound checks are bypassed in the code branch taken for speculative execution. This could cause privileged memory to be accessed and leaked.

For kernel code that has been identified where data pointers could potentially be influenced for Spectre attacks, new “nospec” accessor macros are used to prevent speculative loading of data.

##### Spectre variant 1 (swapgs)

An attacker can train the branch predictor to speculatively skip the swapgs path for an interrupt or exception. If they initialize the GS register to a user-space value, if the swapgs is speculatively skipped, subsequent GS-related percpu accesses in the speculation window will be done with the attacker-controlled GS value. This could cause privileged memory to be accessed and leaked.

For example:

```
if (coming from user space)
    swapgs
mov %gs:<percpu_offset>, %reg
mov (%reg), %reg1
```

When coming from user space, the CPU can speculatively skip the swapgs, and then do a speculative percpu load using the user GS value. So the user can speculatively force a read of any kernel value. If a gadget exists which uses the percpu value as an address in another load/store, then the contents of the kernel value may become visible via an L1 side channel attack.

A similar attack exists when coming from kernel space. The CPU can speculatively do the swapgs, causing the user GS to get used for the rest of the speculative window.

## Spectre variant 2

A spectre variant 2 attacker can *poison* the branch target buffer (BTB) before issuing syscall to launch an attack. After entering the kernel, the kernel could use the poisoned branch target buffer on indirect jump and jump to gadget code in speculative execution.

If an attacker tries to control the memory addresses leaked during speculative execution, he would also need to pass a parameter to the gadget, either through a register or a known address in memory. After the gadget has executed, he can measure the side effect.

The kernel can protect itself against consuming poisoned branch target buffer entries by using return trampolines (also known as “retpline”) [3] [9] for all indirect branches. Return trampolines trap speculative execution paths to prevent jumping to gadget code during speculative execution. x86 CPUs with Enhanced Indirect Branch Restricted Speculation (Enhanced IBRS) available in hardware should use the feature to mitigate Spectre variant 2 instead of retpline. Enhanced IBRS is more efficient than retpline.

There may be gadget code in firmware which could be exploited with Spectre variant 2 attack by a rogue user process. To mitigate such attacks on x86, Indirect Branch Restricted Speculation (IBRS) feature is turned on before the kernel invokes any firmware code.

## 2. A user process attacking another user process

A malicious user process can try to attack another user process, either via a context switch on the same hardware thread, or from the sibling hyperthread sharing a physical processor core on simultaneous multi-threading (SMT) system.

Spectre variant 1 attacks generally require passing parameters between the processes, which needs a data passing relationship, such as remote procedure calls (RPC). Those parameters are used in gadget code to derive invalid data pointers accessing privileged memory in the attacked process.

Spectre variant 2 attacks can be launched from a rogue process by *poisoning* the branch target buffer. This can influence the indirect branch targets for a victim process that either runs later on the same hardware thread, or running concurrently on a sibling hardware thread sharing the same physical core.

A user process can protect itself against Spectre variant 2 attacks by using the prctl() syscall to disable indirect branch speculation for itself. An administrator can also cordon off an unsafe process from polluting the branch target buffer by disabling the process’ s indirect branch speculation. This comes with a performance cost from not using indirect branch speculation and clearing the branch target buffer. When SMT is enabled on x86, for a process that has indirect branch speculation disabled, Single Threaded Indirect Branch Predictors (STIBP) [4] are turned on to

prevent the sibling thread from controlling branch target buffer. In addition, the Indirect Branch Prediction Barrier (IBPB) is issued to clear the branch target buffer when context switching to and from such process.

On x86, the return stack buffer is stuffed on context switch. This prevents the branch target buffer from being used for branch prediction when the return stack buffer underflows while switching to a deeper call stack. Any poisoned entries in the return stack buffer left by the previous process will also be cleared.

User programs should use address space randomization to make attacks more difficult (Set /proc/sys/kernel/randomize\_va\_space = 1 or 2).

### **3. A virtualized guest attacking the host**

The attack mechanism is similar to how user processes attack the kernel. The kernel is entered via hyper-calls or other virtualization exit paths.

For Spectre variant 1 attacks, rogue guests can pass parameters (e.g. in registers) via hyper-calls to derive invalid pointers to speculate into privileged memory after entering the kernel. For places where such kernel code has been identified, nospec accessor macros are used to stop speculative memory access.

For Spectre variant 2 attacks, rogue guests can *poison* the branch target buffer or return stack buffer, causing the kernel to jump to gadget code in the speculative execution paths.

To mitigate variant 2, the host kernel can use return trampolines for indirect branches to bypass the poisoned branch target buffer, and flushing the return stack buffer on VM exit. This prevents rogue guests from affecting indirect branching in the host kernel.

To protect host processes from rogue guests, host processes can have indirect branch speculation disabled via prctl(). The branch target buffer is cleared before context switching to such processes.

### **4. A virtualized guest attacking other guest**

A rogue guest may attack another guest to get data accessible by the other guest.

Spectre variant 1 attacks are possible if parameters can be passed between guests. This may be done via mechanisms such as shared memory or message passing. Such parameters could be used to derive data pointers to privileged data in guest. The privileged data could be accessed by gadget code in the victim's speculation paths.

Spectre variant 2 attacks can be launched from a rogue guest by *poisoning* the branch target buffer or the return stack buffer. Such poisoned entries could be used to influence speculation execution paths in the victim guest.

Linux kernel mitigates attacks to other guests running in the same CPU hardware thread by flushing the return stack buffer on VM exit, and clearing the branch target buffer before switching to a new guest.

If SMT is used, Spectre variant 2 attacks from an untrusted guest in the sibling hyperthread can be mitigated by the administrator, by turning off the unsafe guest's indirect branch speculation via `prctl()`. A guest can also protect itself by turning on microcode based mitigations (such as IBPB or STIBP on x86) within the guest.

### 6.1.7 Spectre system information

The Linux kernel provides a sysfs interface to enumerate the current mitigation status of the system for Spectre: whether the system is vulnerable, and which mitigations are active.

The sysfs file showing Spectre variant 1 mitigation status is:

```
/sys/devices/system/cpu/vulnerabilities/spectre_v1
```

The possible values in this file are:

'Not affected'	The processor is not vulnerable.
'Vulnerable: __user pointer sanitization and usercopy barriers only; no swapgs barriers'	The swapgs protections are disabled; otherwise it has protection in the kernel on a case by case base with explicit pointer sanitation and usercopy LFENCE barriers.
'Mitigation: usercopy/swapgs barriers and __user pointer sanitization'	Protection in the kernel on a case by case base with explicit pointer sanitation, usercopy LFENCE barriers, and swapgs LFENCE barriers.

However, the protections are put in place on a case by case basis, and there is no guarantee that all possible attack vectors for Spectre variant 1 are covered.

The `spectre_v2` kernel file reports if the kernel has been compiled with retrpoline mitigation or if the CPU has hardware mitigation, and if the CPU has support for additional process-specific mitigation.

This file also reports CPU features enabled by microcode to mitigate attack between user processes:

1. Indirect Branch Prediction Barrier (IBPB) to add additional isolation between processes of different users.
2. Single Thread Indirect Branch Predictors (STIBP) to add additional isolation between CPU threads running on the same core.

These CPU features may impact performance when used and can be enabled per process on a case-by-case base.

The sysfs file showing Spectre variant 2 mitigation status is:

```
/sys/devices/system/cpu/vulnerabilities/spectre_v2
```

The possible values in this file are:

- Kernel status:

‘Not affected’	The processor is not vulnerable
‘Mitigation: None’	Vulnerable, no mitigation
‘Mitigation: Retpolines’	Use Retpoline thunks
‘Mitigation: LFENCE’	Use LFENCE instructions
‘Mitigation: Enhanced IBRS’	Hardware-focused mitigation
‘Mitigation: Enhanced IBRS + Retpolines’	Hardware-focused + Retpolines
‘Mitigation: Enhanced IBRS + LFENCE’	Hardware-focused + LFENCE

- Firmware status: Show if Indirect Branch Restricted Speculation (IBRS) is used to protect against Spectre variant 2 attacks when calling firmware (x86 only).

‘IBRS_FW’	Protection against user program attacks when calling firmware
-----------	---

- Indirect branch prediction barrier (IBPB) status for protection between processes of different users. This feature can be controlled through prctl() per process, or through kernel command line options. This is an x86 only feature. For more details see below.

‘IBPB: disabled’	IBPB unused
‘IBPB: always-on’	Use IBPB on all tasks
‘IBPB: conditional’	Use IBPB on SECCOMP or indirect branch restricted tasks

- Single threaded indirect branch prediction (STIBP) status for protection between different hyper threads. This feature can be controlled through prctl per process, or through kernel command line options. This is x86 only feature. For more details see below.

‘STIBP: disabled’	STIBP unused
‘STIBP: forced’	Use STIBP on all tasks
‘STIBP: conditional’	Use STIBP on SECCOMP or indirect branch restricted tasks

- Return stack buffer (RSB) protection status:

‘RSB filling’	Protection of RSB on context switch enabled
---------------	---

- EIBRS Post-barrier Return Stack Buffer (PBRSB) protection status:

‘PBRSB-eIBRS: SW sequence’	CPU is affected and protection of RSB on VMEXIT enabled
‘PBRSB-eIBRS: Vulnerable’	CPU is vulnerable
‘PBRSB-eIBRS: Not affected’	CPU is not affected by PBRSB

Full mitigation might require a microcode update from the CPU vendor. When the necessary microcode is not available, the kernel will report vulnerability.

### 6.1.8 Turning on mitigation for Spectre variant 1 and Spectre variant 2

#### 1. Kernel mitigation

##### Spectre variant 1

For the Spectre variant 1, vulnerable kernel code (as determined by code audit or scanning tools) is annotated on a case by case basis to use nospec accessor macros for bounds clipping [2] to avoid any usable disclosure gadgets. However, it may not cover all attack vectors for Spectre variant 1.

Copy-from-user code has an LFENCE barrier to prevent the access\_ok() check from being mis-speculated. The barrier is done by the barrier\_nospec() macro.

For the swapgs variant of Spectre variant 1, LFENCE barriers are added to interrupt, exception and NMI entry where needed. These barriers are done by the FENCE\_SWAPGS\_KERNEL\_ENTRY and FENCE\_SWAPGS\_USER\_ENTRY macros.

##### Spectre variant 2

For Spectre variant 2 mitigation, the compiler turns indirect calls or jumps in the kernel into equivalent return trampolines (retpolines) [3] [9] to go to the target addresses. Speculative execution paths under retpolines are trapped in an infinite loop to prevent any speculative execution jumping to a gadget.

To turn on retpoline mitigation on a vulnerable CPU, the kernel needs to be compiled with a gcc compiler that supports the -mindirect-branch=thunk-extern -mindirect-branch-register options. If the kernel is compiled with a Clang compiler, the compiler needs to support -mretpoline-external-thunk option. The kernel config CONFIG\_RETPOLINE needs to be turned on, and the CPU needs to run with the latest updated microcode.

On Intel Skylake-era systems the mitigation covers most, but not all, cases. See [3] for more details.

On CPUs with hardware mitigation for Spectre variant 2 (e.g. IBRS or enhanced IBRS on x86), retpoline is automatically disabled at run time.

Systems which support enhanced IBRS (eIBRS) enable IBRS protection once at boot, by setting the IBRS bit, and they're automatically protected against Spectre v2 variant attacks.

On Intel's enhanced IBRS systems, this includes cross-thread branch target injections on SMT systems (STIBP). In other words, Intel eIBRS enables STIBP, too.

AMD Automatic IBRS does not protect userspace, and Legacy IBRS systems clear the IBRS bit on exit to userspace, therefore both explicitly enable STIBP.

The retpoline mitigation is turned on by default on vulnerable CPUs. It can be forced on or off by the administrator via the kernel command line and sysfs control files. See *Mitigation control on the kernel command line*.

On x86, indirect branch restricted speculation is turned on by default before invoking any firmware code to prevent Spectre variant 2 exploits using the firmware.

Using kernel address space randomization (`CONFIG_RANDOMIZE_BASE=y` and `CONFIG_SLAB_FREELIST_RANDOM=y` in the kernel configuration) makes attacks on the kernel generally more difficult.

## 2. User program mitigation

User programs can mitigate Spectre variant 1 using LFENCE or "bounds clipping". For more details see [\[2\]](#).

For Spectre variant 2 mitigation, individual user programs can be compiled with return trampolines for indirect branches. This protects them from consuming poisoned entries in the branch target buffer left by malicious software.

On legacy IBRS systems, at return to userspace, implicit STIBP is disabled because the kernel clears the IBRS bit. In this case, the userspace programs can disable indirect branch speculation via `prctl()` (See Documentation/userspace-api/spec\_ctrl.rst). On x86, this will turn on STIBP to guard against attacks from the sibling thread when the user program is running, and use IBPB to flush the branch target buffer when switching to/from the program.

Restricting indirect branch speculation on a user program will also prevent the program from launching a variant 2 attack on x86. All sandboxed SECCOMP programs have indirect branch speculation restricted by default. Administrators can change that behavior via the kernel command line and sysfs control files. See *Mitigation control on the kernel command line*.

Programs that disable their indirect branch speculation will have more overhead and run slower.

User programs should use address space randomization (`/proc/sys/kernel/randomize_va_space = 1` or `2`) to make attacks more difficult.

### **3. VM mitigation**

Within the kernel, Spectre variant 1 attacks from rogue guests are mitigated on a case by case basis in VM exit paths. Vulnerable code uses nospec accessor macros for “bounds clipping”, to avoid any usable disclosure gadgets. However, this may not cover all variant 1 attack vectors.

For Spectre variant 2 attacks from rogue guests to the kernel, the Linux kernel uses retrampoline or Enhanced IBRS to prevent consumption of poisoned entries in branch target buffer left by rogue guests. It also flushes the return stack buffer on every VM exit to prevent a return stack buffer underflow so poisoned branch target buffer could be used, or attacker guests leaving poisoned entries in the return stack buffer.

To mitigate guest-to-guest attacks in the same CPU hardware thread, the branch target buffer is sanitized by flushing before switching to a new guest on a CPU.

The above mitigations are turned on by default on vulnerable CPUs.

To mitigate guest-to-guest attacks from sibling thread when SMT is in use, an untrusted guest running in the sibling thread can have its indirect branch speculation disabled by administrator via `prctl()`.

The kernel also allows guests to use any microcode based mitigation they choose to use (such as IBPB or STIBP on x86) to protect themselves.

#### **6.1.9 Mitigation control on the kernel command line**

Spectre variant 2 mitigation can be disabled or force enabled at the kernel command line.

`nospectre_v1`

[X86,PPC] Disable mitigations for Spectre Variant 1 (bounds check bypass). With this option data leaks are possible in the system.

`nospectre_v2`

[X86] Disable all mitigations for the Spectre variant 2 (indirect branch prediction) vulnerability. System may allow data leaks with this option, which is equivalent to `spectre_v2=off`.

`spectre_v2=`

[X86] Control mitigation of Spectre variant 2 (indirect branch speculation) vulnerability. The default operation protects the kernel from user space attacks.

**on**

unconditionally enable, implies spectre\_v2\_user=on

**off**

unconditionally disable, implies spectre\_v2\_user=off

**auto**

kernel detects whether your CPU model is vulnerable

Selecting ‘on’ will, and ‘auto’ may, choose a mitigation method at run time according to the CPU, the available microcode, the setting of the CONFIG\_RETPOLINE configuration option, and the compiler with which the kernel was built.

Selecting ‘on’ will also enable the mitigation against user space to user space task attacks.

Selecting ‘off’ will disable both the kernel and the user space protections.

Specific mitigations can also be selected manually:

retpoline auto pick between generic,lfence retpoline,generic Retpolines retpoline,lfence LFENCE; indirect branch retpoline,amd alias for retpoline,lfence eibr Enhanced/Auto IBRS eibr,retpoline Enhanced/Auto IBRS + Retpolines eibr,lfence Enhanced/Auto IBRS + LFENCE ibrs use IBRS to protect kernel

Not specifying this option is equivalent to spectre\_v2=auto.

For user space mitigation:

**spectre\_v2\_user=**

[X86] Control mitigation of Spectre variant 2 (indirect branch speculation) vulnerability between user space tasks

**on**

Unconditionally enable mitigations. Is enforced by spectre\_v2=on

**off**

Unconditionally disable mitigations. Is enforced by spectre\_v2=off

**prctl**

Indirect branch speculation is enabled, but mitigation can be enabled via prctl per thread. The mitigation control state is inherited on fork.

**prctl,ibpb**

Like “prctl” above, but only STIBP is controlled per thread. IBPB is issued always when switching between different user space processes.

**seccomp**

Same as “prctl” above, but all seccomp threads will enable the mitigation unless they explicitly opt out.

**seccomp,ibpb**

Like “seccomp” above, but only STIBP is controlled per thread. IBPB is issued always when switching between different user space processes.

**auto**

Kernel selects the mitigation depending on the available CPU features and vulnerability.

Default mitigation: If CONFIG\_SECCOMP=y then “seccomp”, otherwise “prctl”

Not specifying this option is equivalent to spectre\_v2\_user=auto.

In general the kernel by default selects reasonable mitigations for the current CPU. To disable Spectre variant 2 mitigations, boot with spectre\_v2=off. Spectre variant 1 mitigations cannot be disabled.

### 6.1.10 Mitigation selection guide

#### 1. Trusted userspace

If all userspace applications are from trusted sources and do not execute externally supplied untrusted code, then the mitigations can be disabled.

#### 2. Protect sensitive programs

For security-sensitive programs that have secrets (e.g. crypto keys), protection against Spectre variant 2 can be put in place by disabling indirect branch speculation when the program is running (See Documentation/userspace-api/spec\_ctrl.rst).

#### 3. Sandbox untrusted programs

Untrusted programs that could be a source of attacks can be cordoned off by disabling their indirect branch speculation when they are run (See Documentation/userspace-api/spec\_ctrl.rst). This prevents untrusted programs from polluting the branch target buffer. All programs running in SECCOMP sandboxes have indirect branch speculation restricted by default. This behavior can be changed via the kernel command line and sysfs control files. See [Mitigation control on the kernel command line](#).

### 3. High security mode

All Spectre variant 2 mitigations can be forced on at boot time for all programs (See the “on” option in [\*Mitigation control on the kernel command line\*](#)). This will add overhead as indirect branch speculations for all programs will be restricted.

On x86, branch target buffer will be flushed with IBPB when switching to a new program. STIBP is left on all the time to protect programs against variant 2 attacks originating from programs running on sibling threads.

Alternatively, STIBP can be used only when running programs whose indirect branch speculation is explicitly disabled, while IBPB is still used all the time when switching to a new program to clear the branch target buffer (See “ibpb” option in [\*Mitigation control on the kernel command line\*](#)). This “ibpb” option has less performance cost than the “on” option, which leaves STIBP on all the time.

## 6.2 L1TF - L1 Terminal Fault

L1 Terminal Fault is a hardware vulnerability which allows unprivileged speculative access to data which is available in the Level 1 Data Cache when the page table entry controlling the virtual address, which is used for the access, has the Present bit cleared or other reserved bits set.

### 6.2.1 Affected processors

This vulnerability affects a wide range of Intel processors. The vulnerability is not present on:

- Processors from AMD, Centaur and other non Intel vendors
- Older processor models, where the CPU family is < 6
- A range of Intel ATOM processors (Cedarview, Cloverview, Lincroft, Penwell, Pineview, Silvermont, Airmont, Merrifield)
- The Intel XEON PHI family
- Intel processors which have the ARCH\_CAP\_RDCL\_NO bit set in the IA32\_ARCH\_CAPABILITIES MSR. If the bit is set the CPU is not affected by the Meltdown vulnerability either. These CPUs should become available by end of 2018.

Whether a processor is affected or not can be read out from the L1TF vulnerability file in sysfs. See *L1TF system information*.

### 6.2.2 Related CVEs

The following CVE entries are related to the L1TF vulnerability:

CVE-2018-3615	L1 Terminal Fault	SGX related aspects
CVE-2018-3620	L1 Terminal Fault	OS, SMM related aspects
CVE-2018-3646	L1 Terminal Fault	Virtualization related aspects

### 6.2.3 Problem

If an instruction accesses a virtual address for which the relevant page table entry (PTE) has the Present bit cleared or other reserved bits set, then speculative execution ignores the invalid PTE and loads the referenced data if it is present in the Level 1 Data Cache, as if the page referenced by the address bits in the PTE was still present and accessible.

While this is a purely speculative mechanism and the instruction will raise a page fault when it is retired eventually, the pure act of loading the data and making it available to other speculative instructions opens up the opportunity for side channel attacks to unprivileged malicious code, similar to the Meltdown attack.

While Meltdown breaks the user space to kernel space protection, L1TF allows to attack any physical memory address in the system and the attack works across

all protection domains. It allows an attack of SGX and also works from inside virtual machines because the speculation bypasses the extended page table (EPT) protection mechanism.

## 6.2.4 Attack scenarios

### 1. Malicious user space

Operating Systems store arbitrary information in the address bits of a PTE which is marked non present. This allows a malicious user space application to attack the physical memory to which these PTEs resolve. In some cases user-space can maliciously influence the information encoded in the address bits of the PTE, thus making attacks more deterministic and more practical.

The Linux kernel contains a mitigation for this attack vector, PTE inversion, which is permanently enabled and has no performance impact. The kernel ensures that the address bits of PTEs, which are not marked present, never point to cacheable physical memory space.

A system with an up to date kernel is protected against attacks from malicious user space applications.

### 2. Malicious guest in a virtual machine

The fact that L1TF breaks all domain protections allows malicious guest OSes, which can control the PTEs directly, and malicious guest user space applications, which run on an unprotected guest kernel lacking the PTE inversion mitigation for L1TF, to attack physical host memory.

A special aspect of L1TF in the context of virtualization is symmetric multi threading (SMT). The Intel implementation of SMT is called HyperThreading. The fact that Hyperthreads on the affected processors share the L1 Data Cache (L1D) is important for this. As the flaw allows only to attack data which is present in L1D, a malicious guest running on one Hyperthread can attack the data which is brought into the L1D by the context which runs on the sibling Hyperthread of the same physical core. This context can be host OS, host user space or a different guest.

If the processor does not support Extended Page Tables, the attack is only possible, when the hypervisor does not sanitize the content of the effective (shadow) page tables.

While solutions exist to mitigate these attack vectors fully, these mitigations are not enabled by default in the Linux kernel because they can affect performance significantly. The kernel provides several mechanisms which can be utilized to address the problem depending on the deployment scenario. The mitigations, their protection scope and impact are described in the next sections.

The default mitigations and the rationale for choosing them are explained at the end of this document. See [Default mitigations](#).

### 6.2.5 L1TF system information

The Linux kernel provides a sysfs interface to enumerate the current L1TF status of the system: whether the system is vulnerable, and which mitigations are active. The relevant sysfs file is:

/sys/devices/system/cpu/vulnerabilities/l1tf

The possible values in this file are:

'Not affected'	The processor is not vulnerable
'Mitigation: PTE Inversion'	The host protection is active

If KVM/VMX is enabled and the processor is vulnerable then the following information is appended to the 'Mitigation: PTE Inversion' part:

- SMT status:

'VMX: SMT vulnerable'	SMT is enabled
'VMX: SMT disabled'	SMT is disabled

- L1D Flush mode:

'L1D vulnerable'	L1D flushing is disabled
'L1D conditional cache flushes'	L1D flush is conditionally enabled
'L1D cache flushes'	L1D flush is unconditionally enabled

The resulting grade of protection is discussed in the following sections.

### 6.2.6 Host mitigation mechanism

The kernel is unconditionally protected against L1TF attacks from malicious user space running on the host.

### 6.2.7 Guest mitigation mechanisms

#### 1. L1D flush on VMENTER

To make sure that a guest cannot attack data which is present in the L1D the hypervisor flushes the L1D before entering the guest.

Flushing the L1D evicts not only the data which should not be accessed by a potentially malicious guest, it also flushes the guest data. Flushing the L1D has a performance impact as the processor has to bring the flushed guest data back into the L1D. Depending on the frequency of VMEXIT/VMENTER and the type of computations in the guest performance degradation in the range of 1% to 50% has been observed. For scenarios where guest VMEXIT/VMENTER are rare the performance

impact is minimal. Virtio and mechanisms like posted interrupts are designed to confine the VMEXITS to a bare minimum, but specific configurations and application scenarios might still suffer from a high VMEXIT rate.

### **The kernel provides two L1D flush modes:**

- conditional ( ‘cond’ )
- unconditional ( ‘always’ )

The conditional mode avoids L1D flushing after VMEXITS which execute only audited code paths before the corresponding VMENTER. These code paths have been verified that they cannot expose secrets or other interesting data to an attacker, but they can leak information about the address space layout of the hypervisor.

Unconditional mode flushes L1D on all VMENTER invocations and provides maximum protection. It has a higher overhead than the conditional mode. The overhead cannot be quantified correctly as it depends on the workload scenario and the resulting number of VMEXITS.

The general recommendation is to enable L1D flush on VMENTER. The kernel defaults to conditional mode on affected processors.

**Note**, that L1D flush does not prevent the SMT problem because the sibling thread will also bring back its data into the L1D which makes it attackable again.

L1D flush can be controlled by the administrator via the kernel command line and sysfs control files. See [\*Mitigation control on the kernel command line\*](#) and [\*Mitigation control for KVM - module parameter\*](#).

## **2. Guest VCPU confinement to dedicated physical cores**

To address the SMT problem, it is possible to make a guest or a group of guests affine to one or more physical cores. The proper mechanism for that is to utilize exclusive cpusets to ensure that no other guest or host tasks can run on these cores.

If only a single guest or related guests run on sibling SMT threads on the same physical core then they can only attack their own memory and restricted parts of the host memory.

Host memory is attackable, when one of the sibling SMT threads runs in host OS (hypervisor) context and the other in guest context. The amount of valuable information from the host OS context depends on the context which the host OS executes, i.e. interrupts, soft interrupts and kernel threads. The amount of valuable data from these contexts cannot be declared as non-interesting for an attacker without deep inspection of the code.

**Note**, that assigning guests to a fixed set of physical cores affects the ability of the scheduler to do load balancing and might have negative effects on CPU utilization depending on the hosting scenario. Disabling SMT might be a viable alternative for particular scenarios.

For further information about confining guests to a single or to a group of cores consult the cpusets documentation:

<https://www.kernel.org/doc/CPUESETS>

### **3. Interrupt affinity**

Interrupts can be made affine to logical CPUs. This is not universally true because there are types of interrupts which are truly per CPU interrupts, e.g. the local timer interrupt. Aside of that multi queue devices affine their interrupts to single CPUs or groups of CPUs per queue without allowing the administrator to control the affinities.

Moving the interrupts, which can be affinity controlled, away from CPUs which run untrusted guests, reduces the attack vector space.

Whether the interrupts with are affine to CPUs, which run untrusted guests, provide interesting data for an attacker depends on the system configuration and the scenarios which run on the system. While for some of the interrupts it can be assumed that they won't expose interesting information beyond exposing hints about the host OS memory layout, there is no way to make general assumptions.

Interrupt affinity can be controlled by the administrator via the /proc/irq/\$NR/smp\_affinity[\_list] files. Limited documentation is available at:

<https://www.kernel.org/doc/Documentation/core-api/irq/irq-affinity.rst>

### **4. SMT control**

To prevent the SMT issues of L1TF it might be necessary to disable SMT completely. Disabling SMT can have a significant performance impact, but the impact depends on the hosting scenario and the type of workloads. The impact of disabling SMT needs also to be weighted against the impact of other mitigation solutions like confining guests to dedicated cores.

The kernel provides a sysfs interface to retrieve the status of SMT and to control it. It also provides a kernel command line interface to control SMT.

The kernel command line interface consists of the following options:

nosm	Affects the bring up of the secondary CPUs during boot. The kernel tries to bring all present CPUs online during the boot process. “nosmt” makes sure that from each physical core only one - the so called primary (hyper) thread is activated. Due to a design flaw of Intel processors related to Machine Check Exceptions the non primary siblings have to be brought up at least partially and are then shut down again. “nosmt” can be undone via the sysfs interface.
nosm	Has the same effect as “nosmt” but it does not allow to undo the SMT disable via the sysfs interface.

The sysfs interface provides two files:

- `/sys/devices/system/cpu/smt/control`
- `/sys/devices/system/cpu/smt/active`

`/sys/devices/system/cpu/smt/control`:

This file allows to read out the SMT control state and provides the ability to disable or (re)enable SMT. The possible states are:

on	SMT is supported by the CPU and enabled. All logical CPUs can be onlined and offline without restrictions.
off	SMT is supported by the CPU and disabled. Only the so called primary SMT threads can be onlined and offline without restrictions. An attempt to online a non-primary sibling is rejected
forceoff	Same as ‘off’ but the state cannot be controlled.
off	Attempts to write to the control file are rejected.
not-supported	The processor does not support SMT. It’s therefore not affected by the SMT implications of L1TF. Attempts to write to the control file are rejected.

The possible states which can be written into this file to control SMT state are:

- on
- off
- forceoff

`/sys/devices/system/cpu/smt/active`:

This file reports whether SMT is enabled and active, i.e. if on any physical core two or more sibling threads are online.

SMT control is also possible at boot time via the `l1tf` kernel command line parameter in combination with L1D flush control. See [\*Mitigation control on the kernel command line\*](#).

## 5. Disabling EPT

Disabling EPT for virtual machines provides full mitigation for L1TF even with SMT enabled, because the effective page tables for guests are managed and sanitized by the hypervisor. Though disabling EPT has a significant performance impact especially when the Meltdown mitigation KPTI is enabled.

EPT can be disabled in the hypervisor via the ‘kvm-intel.ept’ parameter.

There is ongoing research and development for new mitigation mechanisms to address the performance impact of disabling SMT or EPT.

### 6.2.8 Mitigation control on the kernel command line

The kernel command line allows to control the L1TF mitigations at boot time with the option “l1tf=”. The valid arguments for this option are:

full	Provides all available mitigations for the L1TF vulnerability. Disables SMT and enables all mitigations in the hypervisors, i.e. unconditional L1D flushing  SMT control and L1D flush control via the sysfs interface is still possible after boot. Hypervisors will issue a warning when the first VM is started in a potentially insecure configuration, i.e. SMT enabled or L1D flush disabled.
full,	Same as ‘full’ , but disables SMT and L1D flush runtime control. Implies the ‘nosmt=force’ command line option. (i.e. sysfs control of SMT is disabled.)
flush	Leaves SMT enabled and enables the default hypervisor mitigation, i.e. conditional L1D flushing  SMT control and L1D flush control via the sysfs interface is still possible after boot. Hypervisors will issue a warning when the first VM is started in a potentially insecure configuration, i.e. SMT enabled or L1D flush disabled.
flush,	Disables SMT and enables the default hypervisor mitigation, i.e. conditional L1D flushing.  SMT control and L1D flush control via the sysfs interface is still possible after boot. Hypervisors will issue a warning when the first VM is started in a potentially insecure configuration, i.e. SMT enabled or L1D flush disabled.
flush,	Same as ‘flush’ , but hypervisors will not warn when a VM is started in a potentially insecure configuration.
off	Disables hypervisor mitigations and doesn’t emit any warnings. It also drops the swap size and available RAM limit restrictions on both hypervisor and bare metal.

The default is ‘flush’. For details about L1D flushing see [1. L1D flush on VMENTER](#).

### 6.2.9 Mitigation control for KVM - module parameter

The KVM hypervisor mitigation mechanism, flushing the L1D cache when entering a guest, can be controlled with a module parameter.

The option/parameter is “`kvm-intel.vmentry_l1d_flush=`” . It takes the following arguments:

al-	L1D cache flush on every VMENTER. way
con	Flush L1D on VMENTER only when the code between VMEXIT and VMENTER can leak host memory which is considered interesting for an attacker. This still can leak host memory which allows e.g. to determine the hosts address space layout.
nev	Disables the mitigation

The parameter can be provided on the kernel command line, as a module parameter when loading the modules and at runtime modified via the sysfs file:

`/sys/module/kvm_intel/parameters/vmentry_l1d_flush`

The default is ‘cond’ . If ‘l1tf=full,force’ is given on the kernel command line, then ‘always’ is enforced and the `kvm-intel.vmentry_l1d_flush` module parameter is ignored and writes to the sysfs file are rejected.

### 6.2.10 Mitigation selection guide

#### 1. No virtualization in use

The system is protected by the kernel unconditionally and no further action is required.

#### 2. Virtualization with trusted guests

If the guest comes from a trusted source and the guest OS kernel is guaranteed to have the L1TF mitigations in place the system is fully protected against L1TF and no further action is required.

To avoid the overhead of the default L1D flushing on VMENTER the administrator can disable the flushing via the kernel command line and sysfs control files. See [Mitigation control on the kernel command line](#) and [Mitigation control for KVM - module parameter](#).

### 3. Virtualization with untrusted guests

#### 3.1. SMT not supported or disabled

If SMT is not supported by the processor or disabled in the BIOS or by the kernel, it's only required to enforce L1D flushing on VMENTER.

Conditional L1D flushing is the default behaviour and can be tuned. See *Mitigation control on the kernel command line* and *Mitigation control for KVM - module parameter*.

#### 3.2. EPT not supported or disabled

If EPT is not supported by the processor or disabled in the hypervisor, the system is fully protected. SMT can stay enabled and L1D flushing on VMENTER is not required.

EPT can be disabled in the hypervisor via the ‘kvm-intel.ept’ parameter.

#### 3.3. SMT and EPT supported and active

If SMT and EPT are supported and active then various degrees of mitigations can be employed:

- L1D flushing on VMENTER:

L1D flushing on VMENTER is the minimal protection requirement, but it is only potent in combination with other mitigation methods.

Conditional L1D flushing is the default behaviour and can be tuned. See *Mitigation control on the kernel command line* and *Mitigation control for KVM - module parameter*.

- Guest confinement:

Confinement of guests to a single or a group of physical cores which are not running any other processes, can reduce the attack surface significantly, but interrupts, soft interrupts and kernel threads can still expose valuable data to a potential attacker. See *2. Guest VCPU confinement to dedicated physical cores*.

- Interrupt isolation:

Isolating the guest CPUs from interrupts can reduce the attack surface further, but still allows a malicious guest to explore a limited amount of host physical memory. This can at least be used to gain knowledge about the host address space layout. The interrupts which have a fixed affinity to the CPUs which run the untrusted guests can depending on the scenario still trigger soft interrupts and schedule kernel threads which might expose valuable information. See *3. Interrupt affinity*.

The above three mitigation methods combined can provide protection to a certain degree, but the risk of the remaining attack surface has to be carefully analyzed. For full protection the following methods are available:

- Disabling SMT:

Disabling SMT and enforcing the L1D flushing provides the maximum amount of protection. This mitigation is not depending on any of the above mitigation methods.

SMT control and L1D flushing can be tuned by the command line parameters ‘nosmt’ , ‘l1tf’ , ‘kvm-intel.vmentry\_l1d\_flush’ and at run time with the matching sysfs control files. See [4. SMT control, Mitigation control on the kernel command line](#) and [Mitigation control for KVM - module parameter](#).

- Disabling EPT:

Disabling EPT provides the maximum amount of protection as well. It is not depending on any of the above mitigation methods. SMT can stay enabled and L1D flushing is not required, but the performance impact is significant.

EPT can be disabled in the hypervisor via the ‘kvm-intel.ept’ parameter.

### **3.4. Nested virtual machines**

When nested virtualization is in use, three operating systems are involved: the bare metal hypervisor, the nested hypervisor and the nested virtual machine. VMENTER operations from the nested hypervisor into the nested guest will always be processed by the bare metal hypervisor. If KVM is the bare metal hypervisor it will:

- Flush the L1D cache on every switch from the nested hypervisor to the nested virtual machine, so that the nested hypervisor’s secrets are not exposed to the nested virtual machine;
- Flush the L1D cache on every switch from the nested virtual machine to the nested hypervisor; this is a complex operation, and flushing the L1D cache avoids that the bare metal hypervisor’s secrets are exposed to the nested virtual machine;
- Instruct the nested hypervisor to not perform any L1D cache flush. This is an optimization to avoid double L1D flushing.

#### **6.2.11 Default mitigations**

The kernel default mitigations for vulnerable processors are:

- PTE inversion to protect against malicious user space. This is done unconditionally and cannot be controlled. The swap storage is limited to ~16TB.
- L1D conditional flushing on VMENTER when EPT is enabled for a guest.

The kernel does not by default enforce the disabling of SMT, which leaves SMT systems vulnerable when running untrusted guests with EPT enabled.

The rationale for this choice is:

- Force disabling SMT can break existing setups, especially with unattended updates.
  - If regular users run untrusted guests on their machine, then L1TF is just an add on to other malware which might be embedded in an untrusted guest, e.g. spam-bots or attacks on the local network.
- There is no technical way to prevent a user from running untrusted code on their machines blindly.
- It's technically extremely unlikely and from today's knowledge even impossible that L1TF can be exploited via the most popular attack mechanisms like JavaScript because these mechanisms have no way to control PTEs. If this would be possible and not other mitigation would be possible, then the default might be different.
  - The administrators of cloud and hosting setups have to carefully analyze the risk for their scenarios and make the appropriate mitigation choices, which might even vary across their deployed machines and also result in other changes of their overall setup. There is no way for the kernel to provide a sensible default for this kind of scenarios.

## 6.3 MDS - Microarchitectural Data Sampling

Microarchitectural Data Sampling is a hardware vulnerability which allows unprivileged speculative access to data which is available in various CPU internal buffers.

### 6.3.1 Affected processors

This vulnerability affects a wide range of Intel processors. The vulnerability is not present on:

- Processors from AMD, Centaur and other non Intel vendors
- Older processor models, where the CPU family is < 6
- Some Atoms (Bonnell, Saltwell, Goldmont, GoldmontPlus)
- Intel processors which have the ARCH\_CAP\_MDS\_NO bit set in the IA32\_ARCH\_CAPABILITIES MSR.

Whether a processor is affected or not can be read out from the MDS vulnerability file in sysfs. See [MDS system information](#).

Not all processors are affected by all variants of MDS, but the mitigation is identical for all of them so the kernel treats them as a single vulnerability.

### 6.3.2 Related CVEs

The following CVE entries are related to the MDS vulnerability:

CVE-2018-12126	MS-BDS	Microarchitectural Store Buffer Data Sampling
CVE-2018-12130	MF-BDS	Microarchitectural Fill Buffer Data Sampling
CVE-2018-12127	MLPDS	Microarchitectural Load Port Data Sampling
CVE-2019-11091	MD-SUM	Microarchitectural Data Sampling Uncacheable Memory

### 6.3.3 Problem

When performing store, load, L1 refill operations, processors write data into temporary microarchitectural structures (buffers). The data in the buffer can be forwarded to load operations as an optimization.

Under certain conditions, usually a fault/assist caused by a load operation, data unrelated to the load memory address can be speculatively forwarded from the buffers. Because the load operation causes a fault or assist and its result will be discarded, the forwarded data will not cause incorrect program execution or state changes. But a malicious operation may be able to forward this speculative data to a disclosure gadget which allows in turn to infer the value via a cache side channel attack.

Because the buffers are potentially shared between Hyper-Threads cross Hyper-Thread attacks are possible.

Deeper technical information is available in the MDS specific x86 architecture section: Documentation/x86/mds.rst.

### 6.3.4 Attack scenarios

Attacks against the MDS vulnerabilities can be mounted from malicious non privileged user space applications running on hosts or guest. Malicious guest OSes can obviously mount attacks as well.

Contrary to other speculation based vulnerabilities the MDS vulnerability does not allow the attacker to control the memory target address. As a consequence the attacks are purely sampling based, but as demonstrated with the TLBleed attack samples can be postprocessed successfully.

## Web-Browsers

It's unclear whether attacks through Web-Browsers are possible at all. The exploitation through Java-Script is considered very unlikely, but other widely used web technologies like WebAssembly could possibly be abused.

### 6.3.5 MDS system information

The Linux kernel provides a sysfs interface to enumerate the current MDS status of the system: whether the system is vulnerable, and which mitigations are active. The relevant sysfs file is:

/sys/devices/system/cpu/vulnerabilities/mds

The possible values in this file are:

'Not affected'	The processor is not vulnerable
'Vulnerable'	The processor is vulnerable, but no mitigation enabled
'Vulnerable: Clear CPU buffers attempted, no microcode'	The processor is vulnerable but microcode is not updated. The mitigation is enabled on a best effort basis. <i>See Best effort mitigation mode</i>
'Mitigation: Clear CPU buffers'	The processor is vulnerable and the CPU buffer clearing mitigation is enabled.

If the processor is vulnerable then the following information is appended to the above information:

'SMT vulnerable'	SMT is enabled
'SMT mitigated'	SMT is enabled and mitigated
'SMT disabled'	SMT is disabled
'SMT Host state unknown'	Kernel runs in a VM, Host SMT state unknown

#### Best effort mitigation mode

If the processor is vulnerable, but the availability of the microcode based mitigation mechanism is not advertised via CPUID the kernel selects a best effort mitigation mode. This mode invokes the mitigation instructions without a guarantee that they clear the CPU buffers.

This is done to address virtualization scenarios where the host has the microcode update applied, but the hypervisor is not yet updated to expose the CPUID to the guest. If the host has updated microcode the protection takes effect otherwise a few cpu cycles are wasted pointlessly.

The state in the mds sysfs file reflects this situation accordingly.

### 6.3.6 Mitigation mechanism

The kernel detects the affected CPUs and the presence of the microcode which is required.

If a CPU is affected and the microcode is available, then the kernel enables the mitigation by default. The mitigation can be controlled at boot time via a kernel command line option. See [Mitigation control on the kernel command line](#).

#### CPU buffer clearing

The mitigation for MDS clears the affected CPU buffers on return to user space and when entering a guest.

If SMT is enabled it also clears the buffers on idle entry when the CPU is only affected by MSBDS and not any other MDS variant, because the other variants cannot be protected against cross Hyper-Thread attacks.

For CPUs which are only affected by MSBDS the user space, guest and idle transition mitigations are sufficient and SMT is not affected.

#### Virtualization mitigation

The protection for host to guest transition depends on the L1TF vulnerability of the CPU:

- CPU is affected by L1TF:

If the L1D flush mitigation is enabled and up to date microcode is available, the L1D flush mitigation is automatically protecting the guest transition.

If the L1D flush mitigation is disabled then the MDS mitigation is invoked explicit when the host MDS mitigation is enabled.

For details on L1TF and virtualization see: [L1TF - L1 Terminal Fault](#).

- CPU is not affected by L1TF:

CPU buffers are flushed before entering the guest when the host MDS mitigation is enabled.

The resulting MDS protection matrix for the host to guest transition:

L1TF	MDS	VMX-L1FLUSH	Host MDS	MDS-State
Don't care	No	Don't care	N/A	Not affected
Yes	Yes	Disabled	Off	Vulnerable
Yes	Yes	Disabled	Full	Mitigated
Yes	Yes	Enabled	Don't care	Mitigated
No	Yes	N/A	Off	Vulnerable
No	Yes	N/A	Full	Mitigated

This only covers the host to guest transition, i.e. prevents leakage from host to guest, but does not protect the guest internally. Guests need to

have their own protections.

### XEON PHI specific considerations

The XEON PHI processor family is affected by MSBDS which can be exploited cross Hyper-Threads when entering idle states. Some XEON PHI variants allow to use MWAIT in user space (Ring 3) which opens an potential attack vector for malicious user space. The exposure can be disabled on the kernel command line with the ‘ring3mwait=disable’ command line option.

XEON PHI is not affected by the other MDS variants and MSBDS is mitigated before the CPU enters a idle state. As XEON PHI is not affected by L1TF either disabling SMT is not required for full protection.

### SMT control

All MDS variants except MSBDS can be attacked cross Hyper-Threads. That means on CPUs which are affected by MFBDS or MLPDS it is necessary to disable SMT for full protection. These are most of the affected CPUs; the exception is XEON PHI, see *XEON PHI specific considerations*.

Disabling SMT can have a significant performance impact, but the impact depends on the type of workloads.

See the relevant chapter in the L1TF mitigation documentation for details: [L1TF - L1 Terminal Fault](#).

#### 6.3.7 Mitigation control on the kernel command line

The kernel command line allows to control the MDS mitigations at boot time with the option “mds=”. The valid arguments for this option are:

full	If the CPU is vulnerable, enable all available mitigations for the MDS vulnerability, CPU buffer clearing on exit to userspace and when entering a VM. Idle transitions are protected as well if SMT is enabled. It does not automatically disable SMT.
full,	The same as mds=full, with SMT disabled on vulnerable CPUs. This is the complete mitigation.
off	Disables MDS mitigations completely.

Not specifying this option is equivalent to “mds=full”. For processors that are affected by both TAA (TSX Asynchronous Abort) and MDS, specifying just “mds=off” without an accompanying “tsx\_async\_abort=off” will have no effect as the same mitigation is used for both vulnerabilities.

### 6.3.8 Mitigation selection guide

#### 1. Trusted userspace

If all userspace applications are from a trusted source and do not execute untrusted code which is supplied externally, then the mitigation can be disabled.

#### 2. Virtualization with trusted guests

The same considerations as above versus trusted user space apply.

#### 3. Virtualization with untrusted guests

The protection depends on the state of the L1TF mitigations. See [Virtualization mitigation](#).

If the MDS mitigation is enabled and SMT is disabled, guest to host and guest to guest attacks are prevented.

### 6.3.9 Default mitigations

The kernel default mitigations for vulnerable processors are:

- Enable CPU buffer clearing

The kernel does not by default enforce the disabling of SMT, which leaves SMT systems vulnerable when running untrusted code. The same rationale as for L1TF applies. See [L1TF - L1 Terminal Fault](#).

## 6.4 TAA - TSX Asynchronous Abort

TAA is a hardware vulnerability that allows unprivileged speculative access to data which is available in various CPU internal buffers by using asynchronous aborts within an Intel TSX transactional region.

### 6.4.1 Affected processors

This vulnerability only affects Intel processors that support Intel Transactional Synchronization Extensions (TSX) when the TAA\_NO bit (bit 8) is 0 in the IA32\_ARCH\_CAPABILITIES MSR. On processors where the MDS\_NO bit (bit 5) is 0 in the IA32\_ARCH\_CAPABILITIES MSR, the existing MDS mitigations also mitigate against TAA.

Whether a processor is affected or not can be read out from the TAA vulnerability file in sysfs. See [TAA system information](#).

### 6.4.2 Related CVEs

The following CVE entry is related to this TAA issue:

CVE-2019-1113<sup>f</sup> TAA TSX Asynchronous Abort (TAA) condition on some microprocessors utilizing speculative execution may allow an authenticated user to potentially enable information disclosure via a side channel with local access.

### 6.4.3 Problem

When performing store, load or L1 refill operations, processors write data into temporary microarchitectural structures (buffers). The data in those buffers can be forwarded to load operations as an optimization.

Intel TSX is an extension to the x86 instruction set architecture that adds hardware transactional memory support to improve performance of multi-threaded software. TSX lets the processor expose and exploit concurrency hidden in an application due to dynamically avoiding unnecessary synchronization.

TSX supports atomic memory transactions that are either committed (success) or aborted. During an abort, operations that happened within the transactional region are rolled back. An asynchronous abort takes place, among other options, when a different thread accesses a cache line that is also used within the transactional region when that access might lead to a data race.

Immediately after an uncompleted asynchronous abort, certain speculatively executed loads may read data from those internal buffers and pass it to dependent operations. This can be then used to infer the value via a cache side channel attack.

Because the buffers are potentially shared between Hyper-Threads cross Hyper-Thread attacks are possible.

The victim of a malicious actor does not need to make use of TSX. Only the attacker needs to begin a TSX transaction and raise an asynchronous abort which in turn potentially leaks data stored in the buffers.

More detailed technical information is available in the TAA specific x86 architecture section: Documentation/x86/tsx\_async\_abort.rst.

### 6.4.4 Attack scenarios

Attacks against the TAA vulnerability can be implemented from unprivileged applications running on hosts or guests.

As for MDS, the attacker has no control over the memory addresses that can be leaked. Only the victim is responsible for bringing data to the CPU. As a result, the malicious actor has to sample as much data as possible and then postprocess it to try to infer any useful information from it.

A potential attacker only has read access to the data. Also, there is no direct privilege escalation by using this technique.

### 6.4.5 TAA system information

The Linux kernel provides a sysfs interface to enumerate the current TAA status of mitigated systems. The relevant sysfs file is:

/sys/devices/system/cpu/vulnerabilities/tsx\_async\_abort

The possible values in this file are:

'Vulnerable'	The CPU is affected by this vulnerability and the microcode and kernel mitigation are not applied.
'Vulnerable: Clear CPU buffers attempted, no microcode'	The system tries to clear the buffers but the microcode might not support the operation.
'Mitigation: Clear CPU buffers'	The microcode has been updated to clear the buffers. TSX is still enabled.
'Mitigation: TSX disabled'	TSX is disabled.
'Not affected'	The CPU is not affected by this issue.

### Best effort mitigation mode

If the processor is vulnerable, but the availability of the microcode-based mitigation mechanism is not advertised via CPUID the kernel selects a best effort mitigation mode. This mode invokes the mitigation instructions without a guarantee that they clear the CPU buffers.

This is done to address virtualization scenarios where the host has the microcode update applied, but the hypervisor is not yet updated to expose the CPUID to the guest. If the host has updated microcode the protection takes effect; otherwise a few CPU cycles are wasted pointlessly.

The state in the tsx\_async\_abort sysfs file reflects this situation accordingly.

### 6.4.6 Mitigation mechanism

The kernel detects the affected CPUs and the presence of the microcode which is required. If a CPU is affected and the microcode is available, then the kernel enables the mitigation by default.

The mitigation can be controlled at boot time via a kernel command line option. See [Mitigation control on the kernel command line](#).

## Virtualization mitigation

Affected systems where the host has TAA microcode and TAA is mitigated by having disabled TSX previously, are not vulnerable regardless of the status of the VMs.

In all other cases, if the host either does not have the TAA microcode or the kernel is not mitigated, the system might be vulnerable.

### 6.4.7 Mitigation control on the kernel command line

The kernel command line allows to control the TAA mitigations at boot time with the option “`tsx_async_abort=`” . The valid arguments for this option are:

off	This option disables the TAA mitigation on affected platforms. If the system has TSX enabled (see next parameter) and the CPU is affected, the system is vulnerable.
full	TAA mitigation is enabled. If TSX is enabled, on an affected system it will clear CPU buffers on ring transitions. On systems which are MDS-affected and deploy MDS mitigation, TAA is also mitigated. Specifying this option on those systems will have no effect.
full,	The same as <code>tsx_async_abort=full</code> , with SMT disabled on vulnerable CPUs that have TSX enabled. This is the complete mitigation. When TSX is disabled, SMT is not disabled because CPU is not vulnerable to cross-thread TAA attacks.

Not specifying this option is equivalent to “`tsx_async_abort=full`” . For processors that are affected by both TAA and MDS, specifying just “`tsx_async_abort=off`” without an accompanying “`mds=off`” will have no effect as the same mitigation is used for both vulnerabilities.

The kernel command line also allows to control the TSX feature using the parameter “`tsx=`” on CPUs which support TSX control. MSR\_IA32\_TSX\_CTRL is used to control the TSX feature and the enumeration of the TSX feature bits (RTM and HLE) in CPUID.

The valid options are:

off	Disables TSX on the system. Note that this option takes effect only on newer CPUs which are not vulnerable to MDS, i.e., have MSR_IA32_ARCH_CAPABILITIES.MDS_NO=1 and which get the new IA32_TSX_CTRL MSR through a microcode update. This new MSR allows for the reliable deactivation of the TSX functionality.
on	Enables TSX. Although there are mitigations for all known security vulnerabilities, TSX has been known to be an accelerator for several previous speculation-related CVEs, and so there may be unknown security risks associated with leaving it enabled.
auto	Disables TSX if X86_BUG_TAA is present, otherwise enables TSX on the system.

Not specifying this option is equivalent to “tsx=off” .

The following combinations of the “tsx\_async\_abort” and “tsx” are possible. For affected platforms tsx=auto is equivalent to tsx=off and the result will be:

tsx= tsx_async_abci	The system will use VERW to clear CPU buffers. Cross-thread attacks are still possible on SMT machines.
tsx= tsx_async_abci	As above, cross-thread attacks on SMT mitigated.
tsx= tsx_async_abci	The system is vulnerable.
tsx= tsx_async_abci	TSX might be disabled if microcode provides a TSX control MSR. If so, system is not vulnerable.
tsx= tsx_async_abci	Ditto
tsx= tsx_async_abci	ditto

For unaffected platforms “tsx=on” and “tsx\_async\_abort=full” does not clear CPU buffers. For platforms without TSX control (MSR\_IA32\_ARCH\_CAPABILITIES.MDS\_NO=0) “tsx” command line argument has no effect.

For the affected platforms below table indicates the mitigation status for the combinations of CPUID bit MD\_CLEAR and IA32\_ARCH\_CAPABILITIES MSR bits MDS\_NO and TSX\_CTRL\_MSR.

MDS	MD_C	TSX_CT	Status
0	0	0	Vulnerable (needs microcode)
0	1	0	MDS and TAA mitigated via VERW
1	1	0	MDS fixed, TAA vulnerable if TSX enabled because MD_CLEAR has no meaning and VERW is not guaranteed to clear buffers
1	X	1	MDS fixed, TAA can be mitigated by VERW or TSX_CTRL_MSR

## 6.4.8 Mitigation selection guide

### 1. Trusted userspace and guests

If all user space applications are from a trusted source and do not execute untrusted code which is supplied externally, then the mitigation can be disabled. The same applies to virtualized environments with trusted guests.

### 2. Untrusted userspace and guests

If there are untrusted applications or guests on the system, enabling TSX might allow a malicious actor to leak data from the host or from other processes running on the same physical core.

If the microcode is available and the TSX is disabled on the host, attacks are prevented in a virtualized environment as well, even if the VMs do not explicitly enable the mitigation.

## 6.4.9 Default mitigations

The kernel's default action for vulnerable processors is:

- Deploy TSX disable mitigation (`tsx_async_abort=full tsx=off`).

## 6.5 iTLB multihit

iTBL multihit is an erratum where some processors may incur a machine check error, possibly resulting in an unrecoverable CPU lockup, when an instruction fetch hits multiple entries in the instruction TLB. This can occur when the page size is changed along with either the physical address or cache type. A malicious guest running on a virtualized system can exploit this erratum to perform a denial of service attack.

### 6.5.1 Affected processors

Variations of this erratum are present on most Intel Core and Xeon processor models. The erratum is not present on:

- non-Intel processors
- Some Atoms (Airmont, Bonnell, Goldmont, GoldmontPlus, Saltwell, Silvermont)
- Intel processors that have the PSCHANGE\_MC\_NO bit set in the IA32\_ARCH\_CAPABILITIES MSR.

### 6.5.2 Related CVEs

The following CVE entry is related to this issue:

CVE-2018-12207	Machine Check Error Avoidance on Page Change
----------------	--

### 6.5.3 Problem

Privileged software, including OS and virtual machine managers (VMM), are in charge of memory management. A key component in memory management is the control of the page tables. Modern processors use virtual memory, a technique that creates the illusion of a very large memory for processors. This virtual space is split into pages of a given size. Page tables translate virtual addresses to physical addresses.

To reduce latency when performing a virtual to physical address translation, processors include a structure, called TLB, that caches recent translations. There are separate TLBs for instruction (iTLB) and data (dTTLB).

Under this errata, instructions are fetched from a linear address translated using a 4 KB translation cached in the iTLB. Privileged software modifies the paging structure so that the same linear address using large page size (2 MB, 4 MB, 1 GB) with a different physical address or memory type. After the page structure modification but before the software invalidates any iTLB entries for the linear address, a code fetch that happens on the same linear address may cause a machine-check error which can result in a system hang or shutdown.

### 6.5.4 Attack scenarios

Attacks against the iTLB multihit erratum can be mounted from malicious guests in a virtualized system.

### 6.5.5 iTLB multihit system information

The Linux kernel provides a sysfs interface to enumerate the current iTLB multihit status of the system: whether the system is vulnerable and which mitigations are active. The relevant sysfs file is:

`/sys/devices/system/cpu/vulnerabilities/itlb_multihit`

The possible values in this file are:

Not affected	The processor is not vulnerable.
KVM: Mitigation: Split huge pages	Software changes mitigate this issue.
KVM: Mitigation: VMX unsupported	KVM is not vulnerable because Virtual Machine Extensions (VMX) is not supported.
KVM: Mitigation: VMX disabled	KVM is not vulnerable because Virtual Machine Extensions (VMX) is disabled.
KVM: Vulnerable	The processor is vulnerable, but no mitigation enabled

### 6.5.6 Enumeration of the erratum

A new bit has been allocated in the IA32\_ARCH\_CAPABILITIES (PSCHANGE\_MC\_NO) msr and will be set on CPU's which are mitigated against this issue.

IA32_ARCH_CAPABILITIES MSR	Not present	Possibly vulnerable, check model
IA32_ARCH_CAPABILITIES[PSCHA]	'0'	Likely vulnerable, check model
IA32_ARCH_CAPABILITIES[PSCHA]	'1'	Not vulnerable

### 6.5.7 Mitigation mechanism

This erratum can be mitigated by restricting the use of large page sizes to non-executable pages. This forces all iTLB entries to be 4K, and removes the possibility of multiple hits.

In order to mitigate the vulnerability, KVM initially marks all huge pages as non-executable. If the guest attempts to execute in one of those pages, the page is broken down into 4K pages, which are then marked executable.

If EPT is disabled or not available on the host, KVM is in control of TLB flushes and the problematic situation cannot happen. However, the shadow EPT paging mechanism used by nested virtualization is vulnerable, because the nested guest can trigger multiple iTLB hits by modifying its own (non-nested) page tables. For simplicity, KVM will make large pages non-executable in all shadow paging modes.

### 6.5.8 Mitigation control on the kernel command line and KVM - module parameter

The KVM hypervisor mitigation mechanism for marking huge pages as non-executable can be controlled with a module parameter “nx\_huge\_pages=”. The kernel command line allows to control the iTLB multihit mitigations at boot time with the option “kvm.nx\_huge\_pages=” .

The valid arguments for these options are:

forc	Mitigation is enabled. In this case, the mitigation implements non-executable huge pages in Linux kernel KVM module. All huge pages in the EPT are marked as non-executable. If a guest attempts to execute in one of those pages, the page is broken down into 4K pages, which are then marked executable.
off	Mitigation is disabled.
autc	Enable mitigation only if the platform is affected and the kernel was not booted with the “mitigations=off” command line parameter. This is the default option.

### 6.5.9 Mitigation selection guide

#### 1. No virtualization in use

The system is protected by the kernel unconditionally and no further action is required.

#### 2. Virtualization with trusted guests

If the guest comes from a trusted source, you may assume that the guest will not attempt to maliciously exploit these errata and no further action is required.

#### 3. Virtualization with untrusted guests

If the guest comes from an untrusted source, the guest host kernel will need to apply iTLB multihit mitigation via the kernel command line or kvm module parameter.

## 6.6 SRBDS - Special Register Buffer Data Sampling

SRBDS is a hardware vulnerability that allows MDS *MDS - Microarchitectural Data Sampling* techniques to infer values returned from special register accesses. Special register accesses are accesses to off core registers. According to Intel’s evaluation, the special register reads that have a security expectation of privacy are RDRAND, RDSEED and SGX EGETKEY.

When RDRAND, RDSEED and EGETKEY instructions are used, the data is moved to the core through the special register mechanism that is susceptible to MDS attacks.

### 6.6.1 Affected processors

Core models (desktop, mobile, Xeon-E3) that implement RDRAND and/or RDSEED may be affected.

A processor is affected by SRBDS if its Family\_Model and stepping is in the following list, with the exception of the listed processors exporting MDS\_NO while Intel TSX is available yet not enabled. The latter class of processors are only affected when Intel TSX is enabled by software using TSX\_CTRL\_MSR otherwise they are not affected.

common name	Family_Model	Stepping
IvyBridge	06_3AH	All
Haswell	06_3CH	All
Haswell_L	06_45H	All
Haswell_G	06_46H	All
Broadwell_G	06_47H	All
Broadwell	06_3DH	All
Skylake_L	06_4EH	All
Skylake	06_5EH	All
Kabylake_L	06_8EH	<= 0xC
Kabylake	06_9EH	<= 0xD

### 6.6.2 Related CVEs

The following CVE entry is related to this SRBDS issue:

CVE-2020-0543	SRBDS	Special Register Buffer Data Sampling
---------------	-------	---------------------------------------

### 6.6.3 Attack scenarios

An unprivileged user can extract values returned from RDRAND and RDSEED executed on another core or sibling thread using MDS techniques.

### 6.6.4 Mitigation mechanism

Intel will release microcode updates that modify the RDRAND, RDSEED, and EGETKEY instructions to overwrite secret special register data in the shared staging buffer before the secret data can be accessed by another logical processor.

During execution of the RDRAND, RDSEED, or EGETKEY instructions, off-core accesses from other logical processors will be delayed until the special register read is complete and the secret data in the shared staging buffer is overwritten.

This has three effects on performance:

1. RDRAND, RDSEED, or EGETKEY instructions have higher latency.

2. Executing RDRAND at the same time on multiple logical processors will be serialized, resulting in an overall reduction in the maximum RDRAND bandwidth.
3. Executing RDRAND, RDSEED or EGETKEY will delay memory accesses from other logical processors that miss their core caches, with an impact similar to legacy locked cache-line-split accesses.

The microcode updates provide an opt-out mechanism (RNGDS\_MITG\_DIS) to disable the mitigation for RDRAND and RDSEED instructions executed outside of Intel Software Guard Extensions (Intel SGX) enclaves. On logical processors that disable the mitigation using this opt-out mechanism, RDRAND and RDSEED do not take longer to execute and do not impact performance of sibling logical processors memory accesses. The opt-out mechanism does not affect Intel SGX enclaves (including execution of RDRAND or RDSEED inside an enclave, as well as EGETKEY execution).

### **6.6.5 IA32\_MCU\_OPT\_CTRL MSR Definition**

Along with the mitigation for this issue, Intel added a new thread-scope IA32\_MCU\_OPT\_CTRL MSR, (address 0x123). The presence of this MSR and RNGDS\_MITG\_DIS (bit 0) is enumerated by CPUID.(EAX=07H,ECX=0).EDX[SRBDS\_CTRL = 9]==1. This MSR is introduced through the microcode update.

Setting IA32\_MCU\_OPT\_CTRL[0] (RNGDS\_MITG\_DIS) to 1 for a logical processor disables the mitigation for RDRAND and RDSEED executed outside of an Intel SGX enclave on that logical processor. Opting out of the mitigation for a particular logical processor does not affect the RDRAND and RDSEED mitigations for other logical processors.

Note that inside of an Intel SGX enclave, the mitigation is applied regardless of the value of RNGDS\_MITG\_DS.

### **6.6.6 Mitigation control on the kernel command line**

The kernel command line allows control over the SRBDS mitigation at boot time with the option “srbds=”. The option for this is:

off	This option disables SRBDS mitigation for RDRAND and RDSEED on affected platforms.
-----	--

### 6.6.7 SRBDS System Information

The Linux kernel provides vulnerability status information through sysfs. For SRBDS this can be accessed by the following sysfs file: /sys/devices/system/cpu/vulnerabilities/srbds

The possible values contained in this file are:

Not affected	Processor not vulnerable
Vulnerable	Processor vulnerable and mitigation disabled
Vulnerable: No microcode	Processor vulnerable and microcode is missing mitigation
Mitigation: Microcode	Processor is vulnerable and mitigation is in effect.
Mitigation: TSX disabled	Processor is only vulnerable when TSX is enabled while this system was booted with TSX disabled.
Unknown: Dependent on hypervisor status	Running on virtual guest processor that is affected but with no way to know if host processor is mitigated or vulnerable.

### 6.6.8 SRBDS Default mitigation

This new microcode serializes processor access during execution of RDRAND, RDSEED ensures that the shared buffer is overwritten before it is released for reuse. Use the “srbd=off” kernel command line to disable the mitigation for RDRAND and RDSEED.

## 6.7 Processor MMIO Stale Data Vulnerabilities

Processor MMIO Stale Data Vulnerabilities are a class of memory-mapped I/O (MMIO) vulnerabilities that can expose data. The sequences of operations for exposing data range from simple to very complex. Because most of the vulnerabilities require the attacker to have access to MMIO, many environments are not affected. System environments using virtualization where MMIO access is provided to untrusted guests may need mitigation. These vulnerabilities are not transient execution attacks. However, these vulnerabilities may propagate stale data into core fill buffers where the data can subsequently be inferred by an unmitigated transient execution attack. Mitigation for these vulnerabilities includes a combination of microcode update and software changes, depending on the platform and usage model. Some of these mitigations are similar to those used to mitigate Microarchitectural Data Sampling (MDS) or those used to mitigate Special Register Buffer Data Sampling (SRBDS).

### **6.7.1 Data Propagators**

Propagators are operations that result in stale data being copied or moved from one microarchitectural buffer or register to another. Processor MMIO Stale Data Vulnerabilities are operations that may result in stale data being directly read into an architectural, software-visible state or sampled from a buffer or register.

#### **Fill Buffer Stale Data Propagator (FBSDP)**

Stale data may propagate from fill buffers (FB) into the non-coherent portion of the uncore on some non-coherent writes. Fill buffer propagation by itself does not make stale data architecturally visible. Stale data must be propagated to a location where it is subject to reading or sampling.

#### **Sideband Stale Data Propagator (SSDP)**

The sideband stale data propagator (SSDP) is limited to the client (including Intel Xeon server E3) uncore implementation. The sideband response buffer is shared by all client cores. For non-coherent reads that go to sideband destinations, the uncore logic returns 64 bytes of data to the core, including both requested data and unrequested stale data, from a transaction buffer and the sideband response buffer. As a result, stale data from the sideband response and transaction buffers may now reside in a core fill buffer.

#### **Primary Stale Data Propagator (PSDP)**

The primary stale data propagator (PSDP) is limited to the client (including Intel Xeon server E3) uncore implementation. Similar to the sideband response buffer, the primary response buffer is shared by all client cores. For some processors, MMIO primary reads will return 64 bytes of data to the core fill buffer including both requested data and unrequested stale data. This is similar to the sideband stale data propagator.

### **6.7.2 Vulnerabilities**

#### **Device Register Partial Write (DRPW) (CVE-2022-21166)**

Some endpoint MMIO registers incorrectly handle writes that are smaller than the register size. Instead of aborting the write or only copying the correct subset of bytes (for example, 2 bytes for a 2-byte write), more bytes than specified by the write transaction may be written to the register. On processors affected by FBSDP, this may expose stale data from the fill buffers of the core that created the write transaction.

## Shared Buffers Data Sampling (SBDS) (CVE-2022-21125)

After propagators may have moved data around the uncore and copied stale data into client core fill buffers, processors affected by MFBDS can leak data from the fill buffer. It is limited to the client (including Intel Xeon server E3) uncore implementation.

## Shared Buffers Data Read (SBDR) (CVE-2022-21123)

It is similar to Shared Buffer Data Sampling (SBDS) except that the data is directly read into the architectural software-visible state. It is limited to the client (including Intel Xeon server E3) uncore implementation.

### 6.7.3 Affected Processors

Not all the CPUs are affected by all the variants. For instance, most processors for the server market (excluding Intel Xeon E3 processors) are impacted by only Device Register Partial Write (DRPW).

Below is the list of affected Intel processors<sup>1</sup>:

Common name	Family_Model	Steppings
HASWELL_X	06_3FH	2,4
SKYLAKE_L	06_4EH	3
BROADWELL_X	06_4FH	All
SKYLAKE_X	06_55H	3,4,6,7,11
BROADWELL_D	06_56H	3,4,5
SKYLAKE	06_5EH	3
ICELAKE_X	06_6AH	4,5,6
ICELAKE_D	06_6CH	1
ICELAKE_L	06_7EH	5
ATOM_TREMONT_D	06_86H	All
LAKEFIELD	06_8AH	1
KABYLAKE_L	06_8EH	9 to 12
ATOM_TREMONT	06_96H	1
ATOM_TREMONT_L	06_9CH	0
KABYLAKE	06_9EH	9 to 13
COMETLAKE	06_A5H	2,3,5
COMETLAKE_L	06_A6H	0,1
ROCKETLAKE	06_A7H	1

If a CPU is in the affected processor list, but not affected by a variant, it is indicated by new bits in MSR IA32\_ARCH\_CAPABILITIES. As described in a later section, mitigation largely remains the same for all the variants, i.e. to clear the CPU fill buffers via VERW instruction.

<sup>1</sup> Affected Processors <https://www.intel.com/content/www/us/en/developer/topic-technology/software-security-guidance/processors-affected-consolidated-product-cpu-model.html>

#### 6.7.4 New bits in MSRs

Newer processors and microcode update on existing affected processors added new bits to IA32\_ARCH\_CAPABILITIES MSR. These bits can be used to enumerate specific variants of Processor MMIO Stale Data vulnerabilities and mitigation capability.

##### MSR IA32\_ARCH\_CAPABILITIES

###### **Bit 13 - SBDR\_SSDP\_NO - When set, processor is not affected by either the**

Shared Buffers Data Read (SBDR) vulnerability or the sideband stale data propagator (SSDP).

###### **Bit 14 - FBSDP\_NO - When set, processor is not affected by the Fill Buffer Stale Data Propagator (FBSDP).**

###### **Bit 15 - PSDP\_NO - When set, processor is not affected by Primary Stale Data**

Propagator (PSDP).

###### **Bit 17 - FB\_CLEAR - When set, VERW instruction will overwrite CPU fill buffer**

values as part of MD\_CLEAR operations. Processors that do not enumerate MDS\_NO (meaning they are affected by MDS) but that do enumerate support for both L1D\_FLUSH and MD\_CLEAR implicitly enumerate FB\_CLEAR as part of their MD\_CLEAR support.

###### **Bit 18 - FB\_CLEAR\_CTRL - Processor supports read and write to MSR**

IA32\_MCU\_OPT\_CTRL[FB\_CLEAR\_DIS]. On such processors, the FB\_CLEAR\_DIS bit can be set to cause the VERW instruction to not perform the FB\_CLEAR action. Not all processors that support FB\_CLEAR will support FB\_CLEAR\_CTRL.

##### MSR IA32\_MCU\_OPT\_CTRL

Bit 3 - FB\_CLEAR\_DIS - When set, VERW instruction does not perform the FB\_CLEAR action. This may be useful to reduce the performance impact of FB\_CLEAR in cases where system software deems it warranted (for example, when performance is more critical, or the untrusted software has no MMIO access). Note that FB\_CLEAR\_DIS has no impact on enumeration (for example, it does not change FB\_CLEAR or MD\_CLEAR enumeration) and it may not be supported on all processors that enumerate FB\_CLEAR.

### 6.7.5 Mitigation

Like MDS, all variants of Processor MMIO Stale Data vulnerabilities have the same mitigation strategy to force the CPU to clear the affected buffers before an attacker can extract the secrets.

This is achieved by using the otherwise unused and obsolete VERW instruction in combination with a microcode update. The microcode clears the affected CPU buffers when the VERW instruction is executed.

Kernel reuses the MDS function to invoke the buffer clearing:

```
mds_clear_cpu_buffers()
```

On MDS affected CPUs, the kernel already invokes CPU buffer clear on kernel/userspace, hypervisor/guest and C-state (idle) transitions. No additional mitigation is needed on such CPUs.

For CPUs not affected by MDS or TAA, mitigation is needed only for the attacker with MMIO capability. Therefore, VERW is not required for kernel/userspace. For virtualization case, VERW is only needed at VMENTER for a guest with MMIO capability.

#### Mitigation points

##### Return to user space

Same mitigation as MDS when affected by MDS/TAA, otherwise no mitigation needed.

##### C-State transition

Control register writes by CPU during C-state transition can propagate data from fill buffer to uncore buffers. Execute VERW before C-state transition to clear CPU fill buffers.

##### Guest entry point

Same mitigation as MDS when processor is also affected by MDS/TAA, otherwise execute VERW at VMENTER only for MMIO capable guests. On CPUs not affected by MDS/TAA, guest without MMIO access cannot extract secrets using Processor MMIO Stale Data vulnerabilities, so there is no need to execute VERW for such guests.

## Mitigation control on the kernel command line

The kernel command line allows to control the Processor MMIO Stale Data mitigations at boot time with the option “mmio\_stale\_data=”. The valid arguments for this option are:

full	If the CPU is vulnerable, enable mitigation; CPU buffer clearing on exit to userspace and when entering a VM. Idle transitions are protected as well. It does not automatically disable SMT.
full,r	Same as full, with SMT disabled on vulnerable CPUs. This is the complete mitigation.
off	Disables mitigation completely.

If the CPU is affected and mmio\_stale\_data=off is not supplied on the kernel command line, then the kernel selects the appropriate mitigation.

## Mitigation status information

The Linux kernel provides a sysfs interface to enumerate the current vulnerability status of the system: whether the system is vulnerable, and which mitigations are active. The relevant sysfs file is:

`/sys/devices/system/cpu/vulnerabilities/mmio_stale_data`

The possible values in this file are:

‘Not affected’	The processor is not vulnerable
‘Vulnerable’	The processor is vulnerable, but no mitigation enabled
‘Vulnerable: Clear CPU buffers attempted, no microcode’	The processor is vulnerable, but microcode is not updated. The mitigation is enabled on a best effort basis.
‘Mitigation: Clear CPU buffers’	The processor is vulnerable and the CPU buffer clearing mitigation is enabled.
‘Unknown: No mitigations’	The processor vulnerability status is unknown because it is out of Servicing period. Mitigation is not attempted.

## Definitions:

**Servicing period:** The process of providing functional and security updates to Intel processors or platforms, utilizing the Intel Platform Update (IPU) process or other similar mechanisms.

**End of Servicing Updates (ESU):** ESU is the date at which Intel will no longer provide Servicing, such as through IPU or other similar update processes. ESU dates will typically be aligned to end of quarter.

If the processor is vulnerable then the following information is appended to the above information:

'SMT vulnerable'	SMT is enabled
'SMT disabled'	SMT is disabled
'SMT Host state unknown'	Kernel runs in a VM, Host SMT state unknown

## References

## 6.8 GDS - Gather Data Sampling

Gather Data Sampling is a hardware vulnerability which allows unprivileged speculative access to data which was previously stored in vector registers.

### 6.8.1 Problem

When a gather instruction performs loads from memory, different data elements are merged into the destination vector register. However, when a gather instruction that is transiently executed encounters a fault, stale data from architectural or internal vector registers may get transiently forwarded to the destination vector register instead. This will allow a malicious attacker to infer stale data using typical side channel techniques like cache timing attacks. GDS is a purely sampling-based attack.

The attacker uses gather instructions to infer the stale vector register data. The victim does not need to do anything special other than use the vector registers. The victim does not need to use gather instructions to be vulnerable.

Because the buffers are shared between Hyper-Threads cross Hyper-Thread attacks are possible.

### 6.8.2 Attack scenarios

Without mitigation, GDS can infer stale data across virtually all permission boundaries:

Non-enclaves can infer SGX enclave data  
 Userspace can infer kernel data  
 Guests can infer data from hosts  
 Guest can infer guest from other guests  
 Users can infer data from other users

Because of this, it is important to ensure that the mitigation stays enabled in lower-privilege contexts like guests and when running outside SGX enclaves.

The hardware enforces the mitigation for SGX. Likewise, VMMs should ensure that guests are not allowed to disable the GDS mitigation. If a host erred and allowed this, a guest could theoretically disable GDS mitigation, mount an attack, and re-enable it.

### 6.8.3 Mitigation mechanism

This issue is mitigated in microcode. The microcode defines the following new bits:

IA32_ARCH_CAPABI R/O	Enumerates GDS vulnerability and mitigation support.
----------------------	--

IA32_ARCH_CAPABI R/O	Processor is not vulnerable.
----------------------	------------------------------

IA32_MCU_OPT_CTL R/W	Disables the mitigation 0 by default.
----------------------	---------------------------------------

IA32_MCU_OPT_CTL R/W	Locks GDS_MITG_DIS=0. Writes to GDS_MITG_DIS are ignored Can't be cleared once set.
----------------------	---

GDS can also be mitigated on systems that don't have updated microcode by disabling AVX. This can be done by setting `gather_data_sampling="force"` or `"clearcpuid=avx"` on the kernel command-line.

If used, these options will disable AVX use by turning off XSAVE YMM support. However, the processor will still enumerate AVX support. Userspace that does not follow proper AVX enumeration to check both AVX *and* XSAVE YMM support will break.

### 6.8.4 Mitigation control on the kernel command line

The mitigation can be disabled by setting `"gather_data_sampling=off"` or `"mitigations=off"` on the kernel command line. Not specifying either will default to the mitigation being enabled. Specifying `"gather_data_sampling=force"` will use the microcode mitigation when available or disable AVX on affected systems where the microcode hasn't been updated to include the mitigation.

### 6.8.5 GDS System Information

The kernel provides vulnerability status information through sysfs. For GDS this can be accessed by the following sysfs file:

`/sys/devices/system/cpu/vulnerabilities/gather_data_sampling`

The possible values contained in this file are:

Not affected	Processor not vulnerable.
Vulnerable	Processor vulnerable and mitigation disabled.
Vulnerable: microcode Mitigation: AVX disabled, no microcode	Processor vulnerable and microcode is missing mitigation. Processor is vulnerable and microcode is missing mitigation. AVX disabled as mitigation.
Mitigation: Microcode	Processor is vulnerable and mitigation is in effect.
Mitigation: Microcode (locked)	Processor is vulnerable and mitigation is in effect and cannot be disabled.
Unknown: Dependent on hypervisor status	Running on a virtual guest processor that is affected but with no way to know if host processor is mitigated or vulnerable.

### 6.8.6 GDS Default mitigation

The updated microcode will enable the mitigation by default. The kernel's default action is to leave the mitigation enabled.

## 6.9 Speculative Return Stack Overflow (SRSO)

This is a mitigation for the speculative return stack overflow (SRSO) vulnerability found on AMD processors. The mechanism is by now the well known scenario of poisoning CPU functional units - the Branch Target Buffer (BTB) and Return Address Predictor (RAP) in this case - and then tricking the elevated privilege domain (the kernel) into leaking sensitive data.

AMD CPUs predict RET instructions using a Return Address Predictor (aka Return Address Stack/Return Stack Buffer). In some cases, a non-architectural CALL instruction (i.e., an instruction predicted to be a CALL but is not actually a CALL) can create an entry in the RAP which may be used to predict the target of a subsequent RET instruction.

The specific circumstances that lead to this varies by microarchitecture but the concern is that an attacker can mis-train the CPU BTB to predict non-architectural CALL instructions in kernel space and use this to control the speculative target of a subsequent kernel RET, potentially leading to information disclosure via a speculative side-channel.

The issue is tracked under CVE-2023-20569.

### 6.9.1 Affected processors

AMD Zen, generations 1-4. That is, all families 0x17 and 0x19. Older processors have not been investigated.

### 6.9.2 System information and options

First of all, it is required that the latest microcode be loaded for mitigations to be effective.

The sysfs file showing SRSO mitigation status is:

```
/sys/devices/system/cpu/vulnerabilities/spec_rstack_overflow
```

The possible values in this file are:

- ‘Not affected’ The processor is not vulnerable
- ‘**Vulnerable: no microcode**’ **The processor is vulnerable, no** microcode extending IBPB functionality to address the vulnerability has been applied.
- ‘**Mitigation: microcode**’ **Extended IBPB functionality microcode** patch has been applied. It does not address User->Kernel and Guest->Host transitions protection but it does address User->User and VM->VM attack vectors.  
(spec\_rstack\_overflow=microcode)
- ‘**Mitigation: safe RET**’ **Software-only mitigation. It complements** the extended IBPB microcode patch functionality by addressing User->Kernel and Guest->Host transitions protection.  
Selected by default or by spec\_rstack\_overflow=safe-ret
- ‘**Mitigation: IBPB**’ **Similar protection as “safe RET” above** but employs an IBPB barrier on privilege domain crossings (User->Kernel, Guest->Host).  
(spec\_rstack\_overflow=ibpb)
- ‘**Mitigation: IBPB on VMEXIT**’ **Mitigation addressing the cloud provider** scenario - the Guest->Host transitions only.  
(spec\_rstack\_overflow=ibpb-vmexit)

In order to exploit vulnerability, an attacker needs to:

- gain local access on the machine
- break kASLR
- find gadgets in the running kernel in order to use them in the exploit
- potentially create and pin an additional workload on the sibling thread, depending on the microarchitecture (not necessary on fam 0x19)
- run the exploit

Considering the performance implications of each mitigation type, the default one is ‘Mitigation: safe RET’ which should take care of most attack vectors, including the local User->Kernel one.

As always, the user is advised to keep her/his system up-to-date by applying software updates regularly.

The default setting will be reevaluated when needed and especially when new attack vectors appear.

As one can surmise, ‘Mitigation: safe RET’ does come at the cost of some performance depending on the workload. If one trusts her/his userspace and does not want to suffer the performance impact, one can always disable the mitigation with `spec_rstack_overflow=off`.

Similarly, ‘Mitigation: IBPB’ is another full mitigation type employing an indirect branch prediction barrier after having applied the required microcode patch for one’s system. This mitigation comes also at a performance cost.

### **6.9.3 Mitigation: safe RET**

The mitigation works by ensuring all RET instructions speculate to a controlled location, similar to how speculation is controlled in the retpoline sequence. To accomplish this, the `_x86_return_thunk` forces the CPU to mispredict every function return using a ‘safe return’ sequence.

To ensure the safety of this mitigation, the kernel must ensure that the safe return sequence is itself free from attacker interference. In Zen3 and Zen4, this is accomplished by creating a BTB alias between the untraining function `srs0_alias_untrain_ret()` and the safe return function `srs0_alias_safe_ret()` which results in evicting a potentially poisoned BTB entry and using that safe one for all function returns.

In older Zen1 and Zen2, this is accomplished using a reinterpretation technique similar to Retbleed one: `srs0_untrain_ret()` and `srs0_safe_ret()`.

## **6.10 Register File Data Sampling (RFDS)**

Register File Data Sampling (RFDS) is a microarchitectural vulnerability that only affects Intel Atom parts(also branded as E-cores). RFDS may allow a malicious actor to infer data values previously used in floating point registers, vector registers, or integer registers. RFDS does not provide the ability to choose which data is inferred. CVE-2023-28746 is assigned to RFDS.

### 6.10.1 Affected Processors

Below is the list of affected Intel processors<sup>1</sup>:

Common name	Family_Model
ATOM_GOLDMONT	06_5CH
ATOM_GOLDMONT_D	06_5FH
ATOM_GOLDMONT_PLUS	06_7AH
ATOM_TREMONT_D	06_86H
ATOM_TREMONT	06_96H
ALDERLAKE	06_97H
ALDERLAKE_L	06_9AH
ATOM_TREMONT_L	06_9CH
RAPTORLAKE	06_B7H
RAPTORLAKE_P	06_BAH
ALDERLAKE_N	06_BEH
RAPTORLAKE_S	06_BFH

As an exception to this table, Intel Xeon E family parts ALDERLAKE(06\_97H) and RAPTORLAKE(06\_B7H) codenamed Catlow are not affected. They are reported as vulnerable in Linux because they share the same family/model with an affected part. Unlike their affected counterparts, they do not enumerate RFDS\_CLEAR or CPUID.HYBRID. This information could be used to distinguish between the affected and unaffected parts, but it is deemed not worth adding complexity as the reporting is fixed automatically when these parts enumerate RFDS\_NO.

### 6.10.2 Mitigation
